Invariably, Edison Batteries bring about greater economies in electric truck delivery. It is a universal experience—and is the reason for Edison leadership in the field of electric transportation. Nearly two thirds of all motive power batteries now in service are Edisons—the only batteries of commercial importance made of iron and steel.

Why not get all the facts? An independent firm of engineers has conducted an impartial investigation of battery costs. A copy of their survey is yours for the asking.

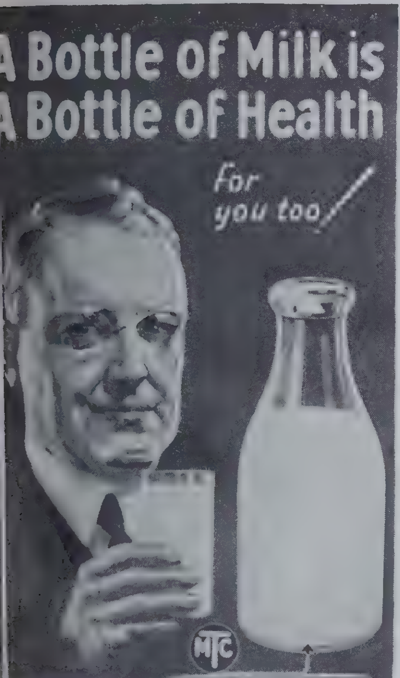
Ohio Dairy finds key to Bigger Milk Sales!



ut this Attractive
oster on Your Wa-
ons and Windows.
your supply now.

THE Lorain Creamery Company, Lorain, O., has used Thatcher Superior Quality Milk Bottles for two years. Last year it used Thatcher Posters on its wagons and windows and in the public schools of Lorain. We quote what happened:

> *"Feeling that Thatcher Advertising in The Saturday Evening Post and other magazines had increased the public interest in milk and had resulted in grown-ups, as well as children, drinking more milk, we tied-up our local advertising with Thatcher National Advertising. We got very good results. In one year, our milk sales jumped 30%."*

The Thatcher Key to bigger milk sales will open many friendly profitable doors to you, as it has for dairymen everywhere. Why not use it? Now is the time to start.

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher bottles that Superior quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown on every Thatcher Bottle for your protection and guarantee. Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

What About the Exclusive Dairy Store?

The Possibilities of Marketing Dairy Products Through Dairy Stores

By WM. H. E. REID*

HE milk that the housewife uses each day comes from one of three sources, namely, (1) direct from producer to consumer, (2) from producer to dis- tor and then to the housewife, and (3) from a re- tore, where milk is carried as a sideline. At the nt time there are very few dairy stores serving exclusive market or outlet for dairy products. is definite reasoning which carries us to believe this channel offers a splendid possibility and that al large corporations at the present time are con- ng the placing of a chain of exclusive stores in the r cities in all the states, which will dispense only and its by-products. They will be operated un- edly on the same basis as the grocery chain stores now occupy considerable prominence and repre- an immense financial saving to the consuming e.

the smaller cities throughout the country the milk najority of instances reaches the consumer directly the producer, while in the larger cities it is impos- to reach every consumer with the same procedure he second or third channels must be resorted to. all number of the cities located in the Middle West s high as 50 per cent of the total volume of milk med through the grocery store. Fluid milk is dis- d chiefly. The small store or the super modern tessen as a means of marketing fluid milk has ed the attention of most of its owners or operators. consumers are of the belief that the store should bute the milk as they distribute other foods. There reat diversity of opinion regarding this question equal number of users of milk think that the mar- of milk should be done by the milk dealers and er channel can render this equal efficiency. There apparent cheapness of either method, or one sys- ould have eliminated the other.

the present time the store plays an important part distribution of fluid milk. The services that the ry store renders may be divided into two classes, y, (1) that of supplying emergency calls for milk, 2) that of providing storage and refrigeration of ntil it is needed for immediate consumption. When products are distributed through a chain store is a saving to the consumer to the extent that the of the milk products would be decreased if these would be operated on the same basis as other stores, namely, cash and carry. This type of store furnish milk for the laboring classes of people, the more well-to-do classes of people would not hemselves of this opportunity and go to the chain for their milk supply. If the price of milk prod- ould be lowered materially then the grocery stores decrease their prices, even to the extent of not g a profit on the milk they handled. They would in order to maintain maximum sales of groceries. organization of chain stores were set up through- e country and they distributed all milk products s milk, butter, cheese, ice cream, buttermilk, etc., cash and carry system, they could very well un- the grocery store and continue to realize a nom- rofit on their investment. However, the consump- milk per capita is so small, especially among the g classes, the volume of milk products might not be sufficient to pay the overhead and assure the desired profit. Thus the selling price of milk would necessarily have to be increased in the chain stores if they were to remain in existence and would almost equal the selling price in the grocery. The general public must be convinced of the nutritional value of milk and milk products before such an organization of chain stores is set up, or the volume of milk sold will not be sufficient to make a profit.

Milk products, especially fluid milk, are perishable unless good refrigeration is practiced. The grocery store cannot handle all of the distribution of milk. On Sundays and holidays the grocery stores are closed and on the days prior to the holidays the housewife must purchase a supply to last two days. Unless the housewife has a refrigerator the milk will sour, especially in the warm summer months. The grocery store cannot afford to distribute milk to those people who desire only milk. This would result in increased delivery costs.

Milk is the only regularly used food in this country. The stores as a rule do not make regular deliveries. The chain stores would not solve this problem since so many people are not in a position to go after the milk when it is needed.

A survey of all cities in the United States that are using the cash and carry system determined the fact that where the consumer relied on their milk supply from these stores, there was a marked irregularity of consumption of milk and the average consumption was lower than in the districts where the consumer relied upon the direct delivery of milk from milk plants or grocery stores.

Until the time comes when the public is educated to the extent of realizing the importance of milk and the consumption per capita decidedly increases, the milk routes and grocery stores are positioned to care for the distribution problem more economically than could an organization of chain stores selling only dairy products.

⁂

THE LENROOT-TABER MILK BILL.

After defeating a motion to recommit by a vote of 48 to 32, the senate on February 4 by a vote of 51 to 27 passed the Lenroot-Taber milk bill to set up sanitary standards to regulate the importation of milk and cream.

This was the dramatic culmination of one of the most bitterly contested legislative fights in the history of the milk industry. During the course of the senate consideration, enemies of the bill introduced nearly a score of amendments whose objects were to either nullify or weaken its provisions so as to make it impossible to administer the act.

The bill now goes back to the house for concurrence in three amendments which were made in the senate and accepted by the advocates of the measure. One of these amendments makes an exception to the tuberculin test and the temperature test of milk when such milk is produced on Canadian farms within 20 miles of a milk plant in the United States and is to be subsequently pasteurized before consumption. The other two amendments apply only to making the temporary permits, which the secretary is to issue, mandatory until such time as the secretary of agriculture is in a position to administer the provisions of the act.

Dairying Booms in the Emerald Isle

The Glamour of Former Days Returns—Ireland Exported to Spain Italy, Gibraltar, and the West Indies in Early Nineteenth Century — Free State's Present Policy of Technical Education Makes Itself Felt — 24-Hour Shipments to All Parts of England

By GEORGE F. KROHA*

IN THE old days of the absentee landlord who lived in London and owned vast estates in Ireland, the picture of the hard-hearted agent driving away the Irish family cow, leaving starving children to cry at their mother's knee, was a common one, and not at all exaggerated. Hand in hand with this ironclad colonial policy to which Ireland was subjected, went a miserable, shiftless, hand-to-mouth cultivation of the soil and an equally careless development of dairying, altogether incommensurate and scarcely conceivable in a country which in its natural endowments was designed to be a land of plenty.

Ireland has never been considered wealthy in mineral deposits, although there are some copper, tin, and iron mines there. Consequently, she has been obliged to rely upon agriculture as the foundation of her economic structure. And in agriculture, dairying has been the dominant keynote.

In spite of the depressing influence of governmental policies which restricted education, Ireland, even in the early nineteenth century, was a large exporter of butter to Spain, Italy, Gibraltar, the West Indies, and certain Asiatic countries. In this connection, Julian F. Harrington, American Vice-Consul in Ireland, points out that the Cork Butter Exchange, which graded and branded the butter going to these various countries, was established by Royal Charter in 1769 and for more than 100 years after its inauguration as an organized system of inspection and grading, was one of the leading butter markets of the world. But the Irish dairy industry has never enjoyed long continued prosperity, due to the inroads made on the English market by neighboring dairy countries. Thus, at the close of the Franco-Prussian war the high prices which prevailed in England greatly stimulated production in European countries which gradually took over most of the Irish trade.

In 1900, the Irish Department of Agriculture and Technical Instruction was created and this represents the first definite scientific attempt to raise the calibre of the Irish dairy industry. This department, by inspection of creameries, instruction courses, the establishment of a register of well-managed creameries, and by various other methods, accomplished more in a few years than in the half century preceding.

Comparison Between Ireland and Denmark.

Prior to this, however, the farmers inaugurated cooperative dairying and in 1884 the first farmers' joint stock creamery was formed. This was two years after the first co-operative creamery was established in Denmark, and it is interesting to note the competitive opment which too place about this time in these countries. The co-operative movement in Denmark forward by leaps and bounds, whereas it progresse slowly in Ireland until recent years.

Comparing Ireland, geographically, with Denn we find that it is more than twice as large as the la that it has four and one-half million people, as ag Denmark's three and one-half million; that its pastu is the finest to be found anywhere, even includin United States, whereas the soils of Denmark have made productive through scientific culture and ment. Denmark's remarkable progress can only plained in terms of the application of science to dair

Now that Ireland has been inoculated with the of Irish Free State's uplift program, there can question about the future of Ireland's place amon dairy-producing nations of the world. In fact, the of the Irish dairy industry may be said to have act begun.

The Development of Winter Dairying.

Up to this time, dairying has been a seasonal i try, but in 1925 the Irish Free State Government

a series of experiments with sugar beet crops, that they could be successfully grown on home s a result, the first crops to be produced on a cial scale were grown in 1926, and, according r Harrington, Irish Vice-Consul, the estimated of beet pulp and tops available for fodder pur-ll approximate 100,000 tons. While the win-on has only just begun, the results thus far , point to a continued carry-on of winter , which will greatly influence total Irish pro-

gely enough, during the last fifty years the num-ilk cows in Ireland has remained practically con-round numbers, 1,500,000. But the producing per cow has in recent years been gradually in- This increased productivity can be traced to the policy which led up to the passage of the ck Breeding Act of 1925, fostering the formation esting associations, the steady exclusion of ani-ertained by tests to be of inferior grade, and gulatory measures.

tly related to this is the Dairy Produce Act of ich had for its primary purpose the improve- the quality of butter manufactured in Ireland. accomplished by regulations dealing with con- f cleanliness, the establishment of a system of marks, the vesting of power in the Minister of re to prohibit the exportation of butter be- be inferior in quality, and the establishment of r of creameries and butter factories.

All of these control regulations along with the offering of free scholarships in technical instruction by the Free State Government to be given at the Dublin and Cork Colleges of the National University of Ireland, are the influencing factors in the present situation.

During 1925 it is true that total Irish butter exports dropped from 457,024,000 pounds (established in 1924) to 401,559,000 pounds. On the other hand, cream exports rose from 490,591 gallons in 1924, to 627,530 gallons in 1925, most of which were shipped directly into England; in the same way, milk shipments in 1925 showed a marked increase over 1924.

The New Free State Dairy Industry.

Shipments can be made to all parts of England within twenty-four hours of the time the milk is produced in Ireland. Few continental dairy countries can hope to compete with Ireland on a service basis which is necessarily related to geographical location. This is particularly true of cream and milk shipments.

© Publishers' Photo Service

THE RICHEST PASTURAGE IN THE WORLD comprising over 9,000,000 acres gives Ireland a physical advantage over many other countries, as for example, Denmark, where scientific culture and treatment of the soil has been necessary. The passage of the Live Stock Breeding Act of 1925 has been a powerful influence in increasing the productivity of the Irish dairy cow. See text.

Thus, with an unusually rich pasturage, coupled with a growing appreciation of the importance of science in agriculture, the Free State strikes a new note of progressiveness which reflects the marked improvement in her political condition.

© Publishers' Photo Service

THE RECEIVING STATION AT BALLYLONGFORD.—While many of Ireland's handling methods are archaic in comparison with American standards, the passage of the Dairy Produce Act of 1924 dealing with regulations on cleanliness, the creation of a system of national marks for butter branding, the offering of free scholarships in technical dairy instruction by the Free State at the Dublin and Cork Colleges of the National University of Ireland, and other regulatory measures have done for the manufacturing end of the industry what the Live Stock Breeding Act has done for production. The location of Ireland within twenty-four hours shipping distance of all parts of England affords her an excellent opportunity for marketing both butter and her fluid milk supply. Ireland has already made large equipment purchases in this country and England, which further suggests the upward trend of the industry.

WESTON TO HAVE NEW MILK PLANT.

Weston, W. Va., is to have a new milk plant which is to be erected at a cost of $15,000 as a result of the recent dairy survey made of Weston and Lewis counties. This survey was made through the co-operation of the Baltimore and Ohio Railroad Company, the Lewis County Farm Bureau and the chamber of commerce as well as a big Eastern dairy.

NEW ZEALAND HAS HIGH STANDARDS MILK.

According to Prof. N. P. Neal of New Zealand, in America to study dairying, standards of purity lished at the farm and not at the consumption en reason for New Zealand to market its butter in Am and English markets at a price sometimes highe the domestic product will command. Home consu of milk, however, is very small, each person usin 27 gallons of milk a year, in contrast to 50 gallo capita in Wisconsin. Wisconsin eats 50 times a ice cream, he said.

On bacteria count and other scientific tests consumption end, America is far ahead of New Z but there are two factors which Prof. Neal said sponsible for the high standard of New Zealan and they are the employment of dairy instructo the grading of milk at its source.

The milk is graded at the factory by experts scores of taste and smell. One of the reasons that ards can be constantly improved is that 94 per the milk is produced by co-operative associations. is all marketed through producer's organizations.

Milk should never be allowed near anything will taint it, he said, since it absorbs odors easily. ing experts in his country detect by smell prese pigs or fowls near the milk house, stagnant water ing from bad drainage, or from the fumes of a g engine used for milking machine power.

The care of milking machines makes the dif between good and bad milk, Prof. Neal said. The be washed with boiling water, he said. The ex quality of New Zealand milk is at least partly due cheap hydro-electric power, which can be switche a heater during the night, when not being used fo purposes, and will produce 15 or 20 gallons of water in the morning, all at a cost of $18 to $25 a

He expressed astonishment that most United separators are washed only once a day, and ofte cold water. Seamless milk pails and quick coo milk were other suggestions to improve quality. T milk to stand in the sun has been found to prod "tinny" flavor sometimes apparent.

The reason that such excellent quality is prod New Zealand, Prof. Neal held, is that farmers a according to the grade, and since it costs no more duce clean milk than dirty, they have elected t their entire production to a good standard. Su grade of butter pays the farmers 34 cents a poun A-1, 32 cents; grade A-2, 30 cents, and second gr cents.

The fact that people are willing to pay for hi ity is shown in the sale of certified milk here, the said. The price charged, however, seems out of tion to the cost of production, he said.

He told of the outdoor milking sheds of his where milk is transferred direct from milking m to separators without being touched. Climatic co make it possible to keep cows on pasture all around.

The methods of handling in use there are no cable here, but Prof. Neal suggested that our might profit by New Zealand's experience in co-o production and marketing and dairy instructio

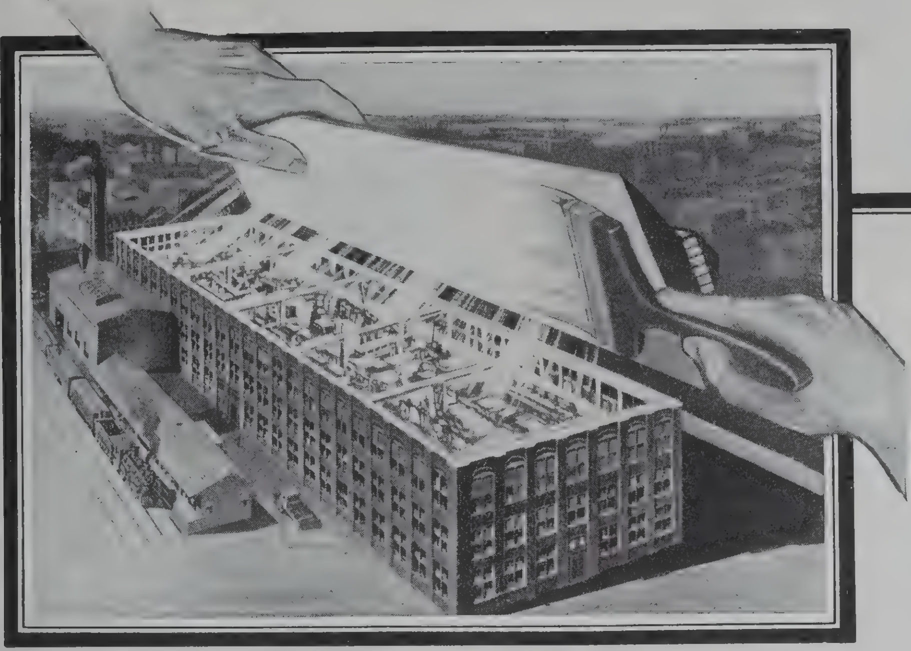
"Milk Dealer" Want Ads buy, sell or exchange thing, anywhere. What have you that you better off without?



Lasting cleanliness and light throughout the plant

at the lowest cost per square foot painted!

BARRELED SUNLIGHT keeps a plant interior clean, light and cheerful for *years without repainting*. Yet the cost of applying it is low. A given quantity covers a larger area—and it flows so freely with brush or spray that many labor-hours are saved.

Resists "yellowing" and discourages dirt! Made by the exclusive Rice Process, Barreled Sunlight is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions. Its surface is so smooth and flawless that dirt can get no foothold, and is easily washed off.

Extremely durable, too. Repeated washing will not wear it away nor injure its lustrous finish.

And Barreled Sunlight is guaranteed not to flake nor scale if properly applied.

Sold in churn-equipped steel drums and in cans. Where more than one coat is required, apply Barreled Sunlight Undercoat first. See coupon below.

KNOW YOUR MILKMA

It's a Simple Matter to Put Milk of Some Sort Into a of Some Sort and Undersell Competitors Who Take Care, But It Is a Foolish Housewife Who Takes a C on Unknown Milk Sold Below the Regular Market

By THURMAN B. RICE, M. D.*

A VERY careful and self-respecting housewife is very proud indeed to believe that she serves her family and her guests with food of the very highest quality. No suspicion of taint or of inferiority may sully her reputation for clean, high grade food. She insists, for instance, that the grocer send her only the reddest of salmon, and the smallest of peas, though, as a matter of fact, the cheaper grades are just as wholesome. Expensive cuts of meat may have a better flavor than the cheaper ones, and are more tender, but otherwise there is little basis for preference, provided both are handled in a sanitary way, and are government inspected.

She must have only strictly fresh eggs, and woe to the groceryman who presumes to send her any other kind. Yet there is mighty little sanitary reason for being so finicky about eggs. They are delivered in the original sterile container, sealed by the original producer—the hen herself. Besides they are nearly always cooked. It is rather hard to see how any transmissible disease might be carried by eggs, and yet the greatest of care is taken to get "good" eggs, and from five to twenty-five cents per dozen extra is cheerfully paid for the assurance that such eggs are "strictly fresh"—whatever that means.

How different the situation with regard to the manner in which milk is purchased! Recently there came through the neighborhood where the writer lives a rough looking man driving a dilapidated wagon. He was telling a hard luck tale about illness in the family, and offering to deliver milk for a cent less on the quart than was charged by the regular companies, which were well-known and long established. Thrifty housewives were obsessed with the idea that a penny saved is a penny earned. For the sake of a cent or two or three a day they were willing to take a chance, though they knew nothing at all about the man or his milk. A few days later they were defending their position by saying that the milk was just as good as any, as they knew because it had a big layer of thick, yellow cream.

The cream line is the customer's usual means of judging milk, and yet—as every capable milkman knows—it is practically worthless as a test of quality. Nursery milk of the very best grade may show a poor cream line because the fat globules are so small, and for that reason do not rise to the top rapidly, or produce a stiff cream. Holstein milk is commonly chosen for nursery purposes and is good milk for the baby just because the globules are small. The fat is there, of course, but it does not make a big show. On the other hand a milk from certain other breeds of cattle would make a splendid showing in this regard even though the milk might be dirty, old, unpasteurized, and everything else that milk should not be.

Good milk is by all means the best of all foods since it is Nature's own answer to the question, "What is a balanced ration?" But carelessly produced mil be most dangerous. For these very good reasons wives should use lots of milk, but should know the man and the milk company that supplies the milk cannot afford to risk his health and that of the for the sake of a penny on the quart. It is eviden it is safer to trust old established companies wi sponsible men in charge.

The production of good milk in large quanti big business, and requires a large and expensive of machinery and equipment. It especially requir attention of trained and trustworthy employees, w preciate the subtle ways of bacteria, and the compl needs of proper nutrition. Large companies have bacteriological laboratories controlling the various in production. Being large, these companies ar spicuous and often the subject of close scrutiny an All of this is as it should be, and is in the interest o milk production.

The smaller producer cannot, of course, have advantages of the large company, but, on the other he escapes many of the complications of a large If he is interested in his product, and in his bu future he will give his personal attention to the of production. As a rule he does not need to bri milk from a great distance, as do some of the larg panies. He can be just as reliable as a company th tributes many thousands of gallons of milk daily. of his reliability will manifest themselves in his stock which comes to your door each morning, the appearance of himself or of his employee w livers the milk. If there is suspicion as to the qua the milk, a pint bottle might be sent, properly id the nearest milk laboratory for analysis, or a phon or letter to the health department having jurisd may give valuable information.

Milk is too important a commodity to be turne to the "bootleg" milkman with a decrepit old w an ancient horse, a dozen battered cans, and a coll of other folks' bottles. It's a simple matter to pu of some sort into a bottle of some sort, and un competitors who take more care, but it is a very housewife who takes a chance on unknown milk s low the regular market price. The money save need be spent with a lot more for doctor's blls.

It is really too bad that housewives are not as about the milk they buy as they are about their eg other foods that are far less important to the hea the household. Beyond doubt good milk is the m uable food that comes to our homes. It is rich i mines, mineral and in fuel value; it is a body, bo tooth builder; it is easily digested and excreted; be served in the widest variety of ways, and is indpe able in cooking; it is one of the cheapest of food the other hand poor milk is one of the most dan of foods if it has been carelessly handled, and h

properly pasteurized. One cannot afford to take
hance with it.

ilk standards are not very tangible to the ordinary
imer. Bacterial counts mean little or nothing to
chemical composition is a mystery; and the various
is of really determining the quality of milk are en-
unknown. He or she has but two yard sticks for
ieasurements of milk—the appearance of the cream
, and the presence or the absence of sediment in the
m of the bottle or glass. As has been explained
is nothing more deceptive than the cream layer,
t should be more generally known that a milk that
s no dirt whatever may still be very dangerous. In-
milks of very high quality are often not permitted
strained or filtered in any way because such pro-
es take out only the visible dirt and leave the milk
ingerous as it was before, while at the same time it
ost its warning sign.

ne must buy a bottle of milk not at all as he buys a
of clothes which he can examine and try on. He
buy the milk on faith. My milk company assures
iat the milk they sell comes from healthy cattle and
barns; that it is handled by healthy workmen, and
ered to the plant as soon as possible and kept cool
insit; that they have properly pasteurized and test-
e milk, and that they stand back of the product. I
ot test out every bottle so I take their word for
n this I feel safe, because I know the company, its
, and its officers. I have been in their plant and
t well equipped and managed, clean and modern in
respect. Probably in no other case am I so de-
ent upon the honor of the establishment selling me
For these reasons I can consistently deal only with
milkmen to whom I know honor is due.

ow it is possible that the one-horse milk peddler to
i we have referred is putting out excellent milk,
cannot be certain of this by inspecting the cream
or by looking for visible dirt that might have been
but has been strained out. Unless I can trust the
I cannot conscientiously give such milk to my chil-
Yet how can I trust him when he is unknown and

iy?

ometimes housewives judge the quality of milk by
ngth of time it will stay sweet. Exceptionally clean
can be kept at moderate temperatures for surpris-
engths of time. We were struck a few years ago
a truck with a glass-lined tank like an enormous
os bottle carried milk a distance of many hundred
in summer, and delivered it still sweet six days
Clean milk will stay sweet longer than dirty milk,
i milk, but milk that has had a preservative added
will stay sweet much longer than either. One
't relish the idea of serving embalmed milk to his
however.

ie addition of preservatives to milk is, of course,
l in most modern communities, but might still be
ced by the peddler. He does not greatly fear the
ecause he has little capital invested, as a rule, and
responsible. Every milkman has "returns," that
tles that come back to the plant unsold. By an-
day this milk will be too old and probably sour or
near it. The shyster can doctor these bottles up,
er, and sell them to-morrow as fresh milk; the
entious and responsible milkman or firm will con-
hem into cheese, buttermilk, butter or some legiti-
product that sails under its own colors, and is what
laimed to be.

a rule milk is worth what it costs. It is not neces-
hat milk for common usage shall be produced under the exceedingly rigid requirements of certain committees of certification that are trying desperately to secure the best possible milk for babies. Such milk sells at from twenty-five to forty cents a quart, and that price is clearly prohibitive for the great mass of people with large families of growing children needing from a pint to a quart of milk a day. But there are a great many communities — indeed, nearly all communities — that would be immensely better off if they would be willing to pay two or three cents more on the quart for their milk, and then, of course, insist on getting a product of corresponding merit.

An example will make this clear. Mr. A. sells his milk at fourteen cents, while Mr. B. sells his at thirteen. Both must get their milk from cows, both must feed the cows, care for them, house and milk them. Both must bottle the milk and haul it to the consumer. Both must have practically the same basic expense and this is, of course, the largest portion of the cost of output. But Mr. A. and Mr. B. handle the milk very differently, and because of this difference the latter can afford to sell his milk cheaper. But from the standpoint of health the proper handling of milk is by far the most important item.

Folks have the right to expect their milkman to provide a safe and acceptable supply of the life-giving fluid provided by Mother Nature for her children. The milkman must receive his proper compensation, because milk production is hard, tedious work, requiring cleanliness, training, care, experience and capital.

The milkman is a sort of foster-father to the family. Very much depends upon his trustworthiness. So we heartily advise folks to get acquainted with the man and the firm that stands behind the baby's bottle, and the family dish of cereal. If they are of the right sort they will be mightily pleased to be so recognized for what they are worth. If they are the other sort you ought to know it. Know your milkman.

MILK COMPANY DOES $900,000 BUSINESS IN 1926.

The election of officers at the annual meeting of the Fort Plain Milk Company, Fort Plain, N. Y., resulted in the following officers and directors being elected:

Robert Z. Smith, president; E. J. Dunkell, vice-president; Clarence H. Brookman, secretary; H. H. Fredericks, treasurer; Fred Failing, Ezra Shults and Howard Walts.

A summary of the business done by the company during during 1926 is as follows: Total milk sold, 27,675,245 pounds, or 325,591 cans; average number of cans per day, 892; average price received for 1926 milk, $2.74 7/12 per hundred pounds; highest price, $3.35 for the December output; number of patrons, 250.

The total volume of business done by the company during the year was $905,555.92, which was an increase of $124,969.27 over last year.

The company is continually improving their plants at Fort Plain and Hallsville, the latest improvements being a $9,000 ice machine and a $3,000 can washer, which were installed in their plant at Hallsville. At Fort Plain an $11,000 glass-lined pasteurizing machine was added to the equipment.

ROSEN DAIRY PLANT TO BE COMPLETED SOON.

The new $225,000 home of the Louis Rosen Dairy, located at 1334-42 S. Peoria St., Chicago, Ill., is expected to be completed about March 1.

The building is two and one-half stories high, is constructed of tile and terra cotta, and is believed to be one of the most modern of its kind in Chicago.

Cleaning a Milk Bottle Without Breaking

The Effect of Temperature and Washing Powder on Bottle Breakage

By DR. J. M. SHERMAN*

THIS report of the fellowship, which this association gives to Cornell University, is based upon the work done by Mr. Myers, a graduate student. Mr. Myers unfortunately cannot be here, so I am giving you a brief report.

The title may be slightly misleading, in that it speaks of bottle breakage losses. This is the ultimate aim of all this work. The present report concerns only one phase of that problem. There are about three angles from which this problem should be attacked. In the first place, there is statistical work, a study of the breakage of bottles, which your association is doing. Then there is the glass technology end. That is being conducted by some of the glass manufacturing interests. The other angle is the germicidal action of these washing powders. You can easily learn to wash bottles with less breakage but you have to learn also what is happening there so far as the bacteria are concerned, and that is the angle of the problem we are working on: To see how germicidal the different commercial washing powders are, why they are germicidal, and how their germicidal action or bacteria-killing action may be increased. If we can find that, you could then increase the efficiency of a washing powder so as to allow you to use lower temperatures. Perhaps that would save a good deal in bottle breakage.

Our first guess was that the germicidal action of most washing powders is due mainly to their alkalinity, and that guess seems to be correct. Therefore, Mr. Myers made a study of the effect of alkalinity upon bacteria, and he has studied in that connection a number of different bacteria, including the typhoid germ, which is one of the main disease germs which may be carried in milk. Tests were made with another organism, bacterium coli, which is, so far as laboratory tests indicate, as difficult to destroy as any of the disease germs which ordinarily occur in milk. Some work has also been done on spores.

Now the germicidal action of alkali is due to what the chemist calls the hydroxyl ion concentration, and I find in the trade somewhat similar terms used. Some of the milk dealers speak about the alkalinity of the washing powder and the "causticity" of washing powder, and they mean by the causticity the effective alkalinity of it. There is a difference between the free alkalinity and the total alkalinity. The free alkalinity, or the effective alkalinity, is what the chemist calls the hydroxyl ion concentration, and that is what we worked upon.

It might be well to give you a few figures. The chemist expresses this alkalinity in terms of what he calls pH, which we do not need to worry about, but neutrality on this scale is pH 7, or the reaction of water. Pure water is neutral. Now a strong alkali, such as you use in titrating milk, a tenth normal sodium hydroxide has a pH of about 13, if I remember correctly. In other words, the figures that we are interested in with respect to washing powders will range between pH 7 and 13; pH 13 is very strongly alkaline and pH 7 is neutral.

In studying this, of course, it was found that the higher the temperature, the more rapidly the bacteria are killed. That is obviously true. But it was also found that as you increase the alkalinity of the washing pow-
der, the lower the temperature necessary to destro
bacteria.

We gave a preliminary report on this last sur
to the committee on bottle breakage at a meeting
in New York. At that time a number of questions
put to us, and we can answer several of those ques
now.

In the first place, this question was asked:
alkaline would a washing powder have to be to ki
the disease germs which might be in or on a milk b
without heating at all. These tests indicate that if
have an alkalinity of pH 12, which is strongly alka
but less alkaline than the tenth normal alkaline solu
you can kill the germs of typhoid fever. You ca
test that as satisfactorily on tuberculosis, because
technique would be very cumbersome and you coul
get very definite results, but with the typhoid organ
an organism which we believe is of about the same
tant as the tuberculosis organism, you will find tha
alkalinity of pH 12 will completely destroy them i
cold in less than five minutes. With a powder that
little less alkaline than that, a pH of about 11, you
get the same results if you use heat of only abou
degrees Fahrenheit.

Now, as a matter of fact, these different was
powders (we have the results on individual powder
I do not believe it would be good taste to put the
the board by name, but any of you who are inter
can see the results) run all the way from a pH of a
10 up to, some of them, as strong as pH 13, whi
very alkaline.

We find that the germicidal action of those wa
powders correlates exactly with this true alkal
We find that some of the most used washing pow
are not alkaline enough to be strongly germicida
though they may be very good cleansers and, ther
mechanically remove most of the bacteria; but
would not do for perfect sterilization. As I think
a moment ago, you can take these washing pow
which are not germicidal and, by adding a little
to them to make them about pH 12, make them ju
germicidal as the other powders.

That is not the only factor, however. There are
factors involved in some of these powders which
them a greater germicidal action than a pure alk
that same degree of alkalinity. What those factor
has not yet been fully determined. They are diff
in different powders.

Of course, you have other types of powders,
as those that have hypochlorites in them, which h
strong germicidal action which is not dependent
their alkalinity.

We have been speaking only of these non-spore
ing bacteria of about the same resistance as the ty
organisms. Spores can be destroyed at relativel
temperatures if you have a very strongly alkaline
tion. Taking spores which can withstand the tem
ture of boiling water for about two hours, and by
a washing powder of about pH 12, they can be dest
in five minutes at a temperature of only 176 degre
which is considerably below boiling. So you se
alkalinity increases the toxicity of the washing po
greatly.

Another question that was put to us was wheth
could get some practical test for determining the alk

Where Will You Buy Your 1927 Crates ? ?

The choosing of the best merchandise for its cost puts a big responsibility on the man holding a buyer's job. In the purchase of crates for this year we are making the buyer's task an easy one. We have combined the two really important features of crate construction—i. e.:

Durability of Crate

Its Protection to Bottles

This is such an outstanding case that no Central Western milk dealer can afford to ignore it. A request will bring a free sample.

Milk Bottle Crate Co.

1543-45
Kingsbury St.,
Chicago

MILK BOTTLE CRATE CO.

When writing to MILK BOTTLE CRATE COMPANY *please mention The Milk Dealer.*

ity of washing powder in a plant. We can answer that if your ideal is a very strongly alkaline powder. If you want a powder which is very strongly alkaline, more alkaline than pH 12, up in the neighborhood of pH 13, there is an indicator called sodium indigodisulphonate, which will determine that.

This indicator, if the reaction is around pH 11.4, or less alkaline than that, is a dark blue color. Around pH 12, it shades off into green and then becomes yellow, as it gets more strongly alkaline. So if you are tryin use a solution of strong alkalinity, which will insure very positive germicidal action, you could use this dicator. This indicator, however, is of no value in t powders which have hypochlorites in them. That is cause of the action of the chlorine; but most of the w ing powders are not of that type. If you are using type, you are depending upon some other kind of ge cidal action than alkalinity anyway.

Whipping Cream

A Report of the Work Done Under the Fellowship of the International Association of Milk Dealers at the University of Wisconsin

Reported by PROF. H. H. SOMMER*

WHEN work on this subject was undertaken, it was with the intention of studying not only the practical phases of this problem but also the physical and physico-chemical phases. Unfortunately, on account of resignations, three different appointments had to be made, and as a result of these interruptions, the study had to be confined to the purely practical phases.

Shortly after work on this problem had been undertaken, the work of Dahlberg and Hening, in Research Bulletin 113 of the N. Y. Geneva Station appeared. This together with the earlier work by Babcock, in the U. S. D. A. Bulletin 1075, covers the practical phases of the problem quite thoroughly. Our work during the year has corroborated the work of these investigators in practically every detail. Since some of these factors are already quite generally known, it will not be necessary here to go into detail, but it will suffice to summarize the conclusions.

It has been found:—(1) The whipping quality is increased with the fat content; there is a marked increase up to 30%; above 30% fat the improvement in whipping is mainly in the quality of the whip and not in the time required to whip.

(2) The temperature at which the cream is whipped is of marked importance. A 30% cream whips well at 50 degrees F., whips less satisfactorily at 60% F. and produces a poor whip at 70 degrees F.

(3) Raw cream whips better than pasteurized cream.

(4) Homogenizing destroys the whipping ability of the cream practically completely.

(5) Aging improves the whipping ability of cream. The biggest improvement occurs in the first 48 hours of aging, after which the improvement is slight.

(6) The increase in volume on whipping bears no definite relation to the quality of the whip, although frequently the poorer whipping cream shows the greatest increase in volume. With any given cream, there is a large increase in volume early in the whipping, followed by a decrease in volume as the maximum stiffness of the whip is attained.

(7) The permanence of the whip as measured by the amount of liquid draining out on standing, is proportional to the stiffness of the whip.

(8) There is a pronounced difference in the speed with which ordinary household beaters will whip cream. Of the six different whippers tried, the time ranged from 30 seconds to 6 minutes to accomplish the same stiffness of whip. In this comparison the whipping was done in a cold room at a temperature of 45 degrees F. or slig below. These same whippers used under ordin household conditions, would have showed a much lar difference. In ordinary household practice the whip and the bowl are at room temperature; the crear taken out of the ice box; and the whipping is don room temperature. If a rapidly whipping whippe used, the chances for success are good because the w per will accomplish the whipping before the tem ature has a chance to rise to a point where whippin impossible. On the other hand, if a slowly whipp whipper is used, the temperature of the cream will to a point unfavorable for whipping, and it will be possible to obtain a good whip. It is safe to say 90% of the complaints on whipping cream are du the fact that the importance of having the cream co disregarded, together with the use of inefficient whipp

(9) The condition of the fat at the time of s rating the cream has a rather marked effect on the cosity and the whipping ability of the cream. Cr separated while the fat is in a semi-solid condition h higher viscosity and whips better than cream separ while the fat is fluid. Dahlberg and Hening compar the cream of milk separated immediately after mil with the cream from another portion of the same separated after holding at 37.4 degrees F. found above mentioned difference. In our work the milk r ceived at the university creamery was separated at ferent temperatures ranging from 60 degrees F. to degrees F. The results corroborated the finding Dahlberg and Hening, viz. the viscosity of the cream highest at the lowest temperature of separation, and stiffness of the whip obtained was also highest in cra separated at the lowest temperature. No doubt par this difference is due to the clustering of the fat glob that is induced by separating at a low temperature. addition to this it is my theory that there is a thic film of absorbed material on the fat globules in cra separated from the colder milk, due to the fact that kinetic energy of the particles is reduced. At equilibr um between the surface tension forces which cause absorption, and the tendency to diffuse caused by kinetic energy of the particles, there would then larger amount of substances absorbed. Since this ab sorbed substance is supposedly also the substance wic has a marked effect on the whipping of the crea seems probable that the effect of separating milk at ferent temperatures is operative on the whipping abi of the cream not only on account of the way the f grouped, but also on account of the greater amou material absorbed at the lower temperatures.

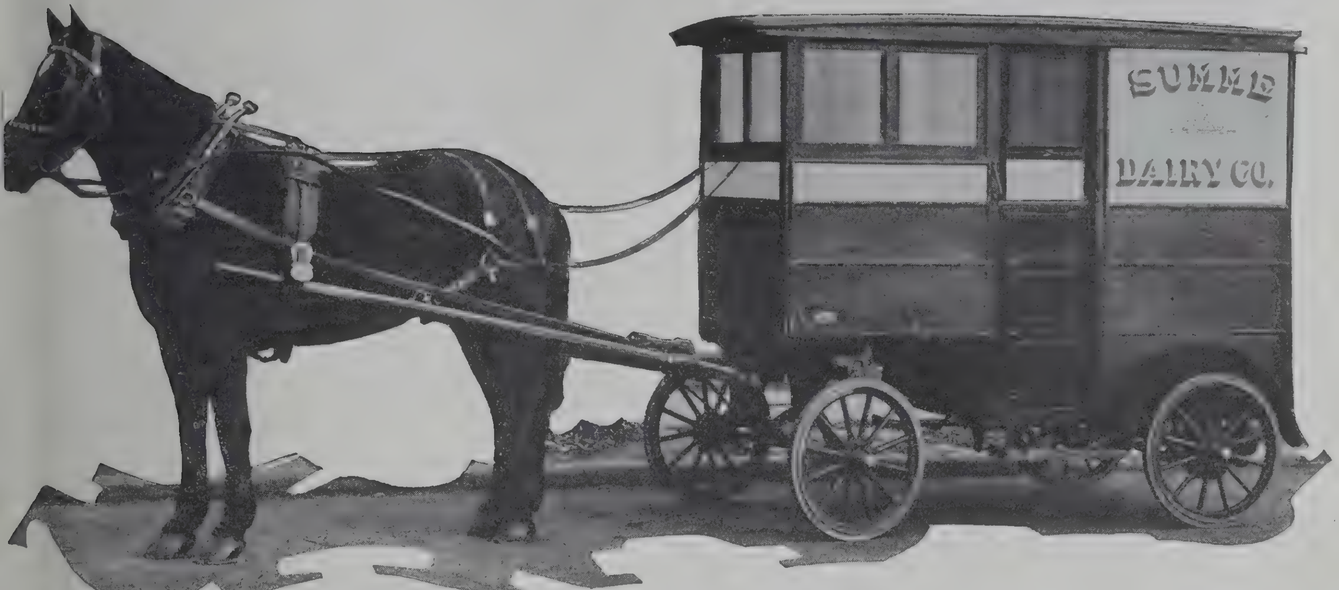
The HESSE AUTOWAGON

"The Modern Milk Wagon"



In 1500 lbs. Capacity—THE DROP SILL STYLE—or 2500 lbs. Capacity
24 CASES **Also made in the Straight Sill Style** **42 CASES**

you realize that the only way the public—those who are your stomers and those whom you want as customers—has of judging ur plant operations and the manner in which your business is nducted is by their daily contact with your delivery equipment?

Do YOUR wagons reflect the modern methods employed in your plant?
Do YOUR wagons reflect the up-to-date sanitary conditions in your plant?
Do YOUR wagons reflect the modern appearance of your plant?

ad what Mr. A. J. SUMME of the SUMME DAIRY of Kansas City thinks of HE HESSE AUTOWAGON

"Since putting the Hesse Autowagon in service nearly two years ago we have kept close tabulation of the results as com- d to our old style of equipment. We have found this wagon far superior in every respect. Our horses are much better oing and easier kept. Our drivers have become salesmen and are much better satisfied because of the comfort of this low easy riding wagon. And foremost of all, these up-to-date wagons have gained us much favorable publicity and confidence e public, reflecting as they do the up-to-date methods employed in our plant to give them A1 product and service.
We would not consider any other type of equipment."

SEND FOR FURTHER INFORMATION. WE'LL BE GLAD TO TALK THIS OVER WITH YOU.

They Saved the Milk for Chicago

Men Endure Hardship to Bring Supply of Milk Through to Destination and Save Loss to Their Employers. Northern Illinois Storm Remind Old Timers of Pioneer Days

WASHINGTON at Valley Forge had nothing on the crew of men which labored in 18 degrees below zero in a driving sleet two nights and a day last month to rescue trucks containing the milk supply of 30,000 Chicago children.

Two trucks and a trailer, holding three large glass-lined tanks filled with nature's food for children, started from Dundee for Chicago early Thursday morning. Half way to the city on Higgins' Road the trucks were stalled in a five-foot snowdrift and the helpless drivers called on the Bowman Dairy Company in Chicago for aid. Snowplows from the highway roadmen had given up when within five miles of the trucks.

A call for volunteers in the dairy company's office brought forth the pick of the men, and a crew was hastily equipped with sweaters, horse-blankets, overshoes and shovels. They drove in cars to Snell's Corners, where they had been informed they would be obliged to walk the remaining three-quarters of a mile. Arriving at the Corners at dusk, with shovels, torches and already crisp fingers, they gave up the cars and started out for the trucks. The wind whistled and blew driving sleet into the faces of the men, the snow became encrusted and slippery and the three-quarters of a mile to the trucks lengthened into nearly five miles, to the surprise of the crew.

A farmer was prevailed upon to furnish bobsleds on which the men trailed with their shovels and the trucks were discovered, buried in the snow, the drivers beating themselves to keep warm and keeping the motors running to prevent their freezing. The rescue crew took shelter in a nearby farm house and held a council with the drivers, the fear uppermost in their minds being that the milk might freeze and expand in the tanks, bursting expensive equipment and losing the valuable milk supply necessary for the needs of Chicago the following day.

An examination showed that a slight crust of ice had formed on the milk but it was otherwise in fine condition. The men started in with shovels to remove the snow, but it seemed a hopeless proposition. The snow was crusted and had melted underneath and frozen solid in the lowest temperature of the year. Working until 3:30 in the morning the crew had advanced the trucks but a mile and a half when farmers were secured with horses and plows. These plows made two furrows the width of the car tracks and were followed by the men, taking turns with shovels, to clear away. When the horses came to a snowdrift the men were obliged to pile in and excavate in trench fashion.

By the following morning the men were exhausted from lack of sleep and cold and a report to the Chicago office brought forth a second rescue of eleven men. The exhausted force rolled up in blankets by the farmer's fire for a few hours, but by noon Friday were out again, advancing the trucks by degrees. One of the cars in which the rescue crew had come was frozen stiff and one of the trucks which had been stopped to save gasoline could not be started without a good deal of difficulty.

The wind blew up drifts of snow, making the work as disagreeable as though in a heavy snowstorm. Not until Saturday morning did the trucks dig their tedious through the five miles of snow and ice to hurry i Chicago, just in time to prevent a shortage of milk, principal food supply for 30,000 children. One ma face was frozen and for several days carried a solid s over the left side of his face. Another man's hand frozen, but they were cheerful and regarded their perience as a signal service to the people of Chica whom the dairymen serve, that they delivered the m without loss of a single customer's supply, saved large glass-lined trucks and brought the milk throu in fine condition to Chicago with a change of but degrees in temperature in the entire three days, in sp of temperatures of fifteen to eighteen degrees below ze One of the drivers who was working constantly for th days when taken in to a fire at a corner roadhouse c pletely lost control of himself, and, as the men remo his clothing and shoes, he broke down hysterically two days' rest was all that saved him.

“This experience,” according to the National Da Council, the educational organization for the dairy dustry, “is typical of the service which a four bil dollar industry, which supplies the fundamental food children, must consider in its routine of the day. I the worst situation a Chicago dairyman has ever exp enced and some customers were obliged to do with milk during this severe storm. With our modern meth of transporting milk in glass-lined refrigerator cars trucks, however, the milk is kept in excellent condit It is reported that during the summer months, milk f Wisconsin is delivered in Chicago with a change of one-half a degree in temperature.”

⚜

CLEVELAND EXPOSITION DATES FIXED.

The second great unified Dairy Industries Exposi of all the physical requirements for the manufacture distribution of dairy food products will be held Oct 24-29, inclusive, the Dairy and Ice Cream Machinery Supplies Association has announced.

Selection of Cleveland as the scene for the 1927 S was announced a number of weeks ago. Determina of exact dates was deferred to permit the working of various convention arrangements.

October 24, the opening day of the exposition, wil Monday. The exposition will close Saturday. This m a change from the nine-day period, embracing the la half of one week, the first half of a succeeding week, the intervening week end, which was experimentl used in Detroit last year, and a reversion to the calen week exposition plan pursued in most industrial sh

The exposition committee of the Dairy and Ice Cr Machinery and Supplies Association, of which K. W Schantz, K. W. Schantz, Inc., is chairman, reports ha much of the important primary preparation for the ex position is already under way.

10-ton Fruehauf Semi-Trailer—with Refrigerator type of body—owned and operated by Borden Farm Products Co., Inc., of New York City

Low-Cost Distribution of Milk

THE Borden Farm Products Co., Inc., of New York City—well known as the largest Milk Dealers in the country—were one of the first organizations to adopt the Semi-Trailer with Refrigerator body as a means for distributing Milk to Branches.

In the 10-ton Fruehauf Semi-Trailer, shown in the above photograph, approximately 300 quart cases of bottled milk are hauled with very satisfactory results.

And when you consider the substantial reduction made in distribution costs through the use of such Trailer equipment, you will readily understand why the Fruehauf Trailer system is being adopted by leading Milk institutions everywhere.

No longer is it practical to erect expensive Branches in the different delivery zones of your city—with the heavy cost of handling—of modern refrigerator equipment—and the expense of necessary supervision and labor.

Just compare the cost of such a system with the economy of Fruehauf Refrigerator Trailers. These storage-plants-on-wheels can be "spotted" each night in convenient locations throughout your territory. Then, early in the morning, the neighborhood delivery wagons can be loaded directly from the Trailers—saving extra handling and the heavy investment required for permanent plants.

Certainly such an investigation will point the way to greatly reduced haulage costs and a surprising increase in profits!

Write today for new Folder "C"—giving the interesting details of Trailer transportation in your special field.

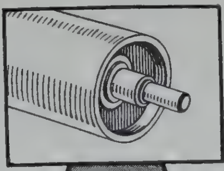
Star Performance

5 points of superiority that make

LAMSON SANITARY CONVEYORS

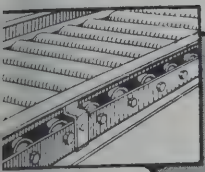
last longer

1



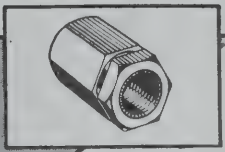
Moisture can't get in. Corrosion comes with moisture. Keep moisture out and you prevent corrosion. Lamson Rollers, extra-heavy throughout, have heads *welded in.* No joint through which moisture can enter. No inside corrosion. Remember that.

2



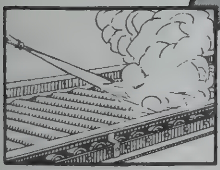
pecial guard rail
ver roller ends.
'his heavy angle
on guard rail, set-
ng in over the ends
f the rollers, pre-
ents can-chimes
om dropping off
d blocking the
onveyors. *And this*
ves wear. Sliding
ns over rollers that
n't turn wears
t the rolls and
e cans, both.
he Lamson
onveyor never
alls or blocks.

5



Non-corrosive bearings of special design. The bearings are cast of non-corrosive alloy. They are extremely resistive to all corrosive action. They are hexagonal in shape, so inserted in the frame that they can never turn with the shafts. Consequently they cannot freeze, and always operate.

3



Stands up under flushing and steaming. Turn the hot water on it as often as you please. Steam it often as you want. You can't harm the bearings, you can't force any moisture into any part where it will be harmful. Lamson has designed this conveyor to stand a limitless amount of cleaning

Durable—and therefore lower in *yearly* cost.

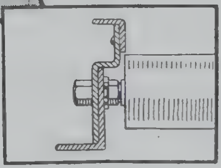
Easily kept clean—and therefore saving in time and labor.

For these two reasons alone, it pays to own Lamson Sanitary Conveyors.

Send coupon for more information.

THE LAMSON COMPANY
SYRACUSE, N. Y.

4



Practical mounting. The frame is so designed that it forms a cup-like protection to keep moisture and milk away from the shafts and bearings. This mounting maintains dryness of the moving parts, even in conditions where a great deal of moisture is present. It adds greatly to the service of Lamson conveyors, and helps to prevent rolls from sticking.

MUSSOLINI'S SOLE BREAKFAST IS LARGE GLASS OF MILK.

The kind of a breakfast which one of the strongest political figures in modern history finds necessary to maintain vigor is discussed in the exclusive story of the personal life of Mussolini, the Italian dictator, which has been released to newspapers of America through the United Press Association, with permission extended the National Dairy Council to reprint it.

Mussolini is regarded by his followers as the busiest man in the world, working intensively fourteen to sixteen hours a day. The Duce personally holds seven portfolios in his own government and every minute of each day is scheduled in advance for something definite he must do. Personal efficiency and hard work are his pet hobbies and it was through his belief that his own example of efficiency would do good in the world if widely known that he consented to allow Thomas B. Morgan, Rome manager of the United Press, to publish his personal habits, from which the following is quoted.

After arising in the morning and shaving, Mussolini tells of his breakfast:

"I go then fully attired wearing my riding breeches to breakfast. It is what I call breakfast. I wonder sometimes what an Englishman or an American or a German would call it, and what he would do with such a breakfast as mine. There is no fruit. There is no toast. There are no sausages, ham and eggs, breakfast foods or anything which would typify the modern breakfast. There is even no coffee, for I do not drink coffee in any form—it is not a food, it is disastrous for brain-workers. My breakfast simply consists of a glass of milk and is a matter of one minute. I drink it at the table in sm gulps so that it may be properly salivated.

"Milk is a wonderful food, perhaps the best f known to man. This one glass of milk contains eno nourishment to sustain me until the midday meal. hours hence. It is always taken when I am alone, f am not a great lover of company at the table. The gr est honor I can bestow upon anyone is to invite then lunch. It would even be an honor for my own brot Cosira, my servant, puts the milk on the table and t withdraws. She is 40 and silent, uncommunicative.

"It is 7:30, and I am ready to take my morning ter."

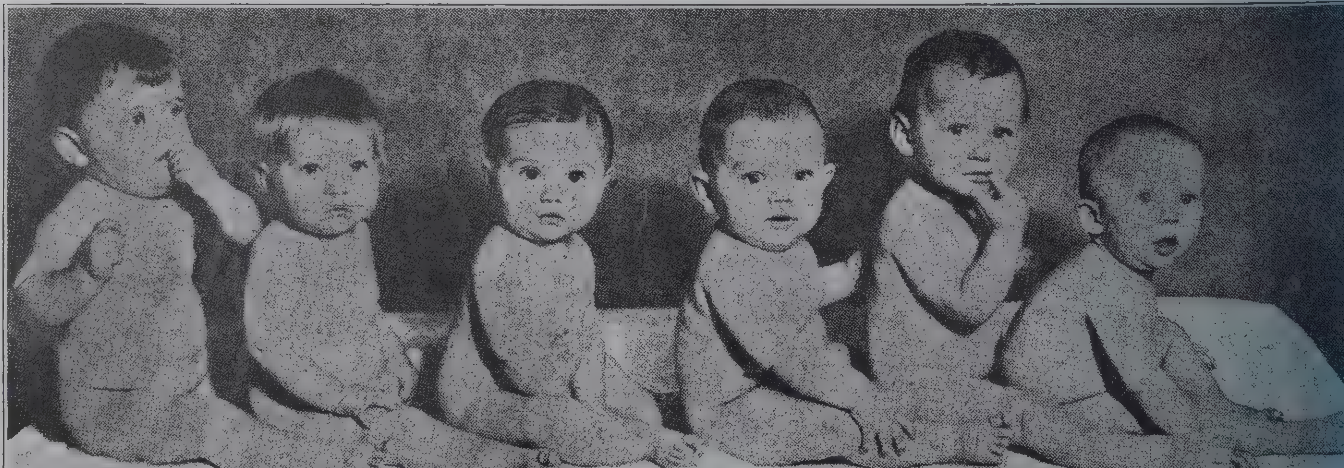
◆

MRS. NEWTON COMBS IS PRESIDENT OF BA MILK SUPPLY.

Mrs. Newton Combs was re-elected president of Baby Milk Supply, Philadelphia, at the annual mee of that organization. The other officers were chose follows: First vice-president, Mrs. Thomas Owsley; ond vice-president, Mrs. Samuel Halley; third vice-p ident, Mrs. Leonard G. Cox; recording secretary, D. J. Healy; corresponding secretary, Mrs. Jacob Spe treasurer, Mrs. Robert D. Scott.

All were re-elected, except for the offices of t vice-president and treasurer, from which Mrs. Cole Callaway and Miss Pauline Purcell resigned. Miss cell was unable to fill longer the office of treasurer the society because of her work at the Chimney Cor She has been one of the valued officers for a numbe years.

GEE, WHEN IS THAT MILK MAN COMING?



This striking picture was used in a Community Chest Campaign in Tampa, Fla. "Your contributions to the chest fund v help to send the milk man regularly to many like these," said the Tampa Tribune.

INCO
NICKEL

Why you should use
Pure Solid
INCo Nickel
dairy equipment

1. **EASY TO CLEAN—**

Purity of product and resulting increase in consumption are founded on thorough cleanliness in the dairy. Nickel makes such cleanliness possible with a minimum of effort. All types of cleaners, whether or not they contain abrasives or strong chemicals, are being used on pure nickel equipment. Such cleaners not only preserve the natural attractive appearance of nickel but maintain the high quality of the products handled. Users of pure nickel equipment consistently report lower bacterial counts even after years of service.

2. **IMPARTS NO FOREIGN FLAVOR—**

Nickel belongs to the iron group of metals but does not impart any foreign flavor to any dairy products handled in it. It is interesting to note that the U. S. Department of Agriculture places no legal limit on the nickel content of foodstuffs.

3. **DOES NOT RUST—RESISTS CORROSION—**

Nickel will not rust and is extremely resistant to the corrosion of dairy products, even those of high lactic content.

4. **HAS GREAT STRENGTH-**

Pure solid nickel, rolled into all commercial forms suitable for the construction of dairy machinery, is a strong, tough, silvery white metal, having higher physical properties and greater resistance to denting and abuse than any other material obtainable for such construction. Because of the high strength of pure nickel, thinner gauges can be used.

5. **TRANSMITS HEAT WELL—**

Nickel in the form of tubes and sheets used in dairy equipment is a good conductor of heat.

6. **ADAPTABILITY—**

Leading manufacturers of dairy equipment are rapidly adapting INCO nickel to their regular lines of equipment. Nickel is readily formed, seamed, welded, brazed, silver and soft soldered. Nickel tubing is coiled by the usual methods. It is just as easy to get dairy equipment of pure nickel as of inferior materials.

Availability

The development of the nickel industry dates back over fifty years. The mines and smelter are located in the Sudbury district of Canada. Ore bodies, already located, assure a practically inexhaustible supply of raw material. The refining is carried on in a modern refinery at Port Colborne, Ontario, with a capacity of over 5,000,000 pounds of nickel per month.

After refining the nickel is shipped to the company's rolling mill at Huntington, West Virginia. This plant extends over more than 40 acres and is equipped with machinery of the very latest design for the production of rolled nickel in the forms of sheet, rod, tubing, etc. Over $5,000,000.00 is invested in this plant alone.

Stocks are carried both at Huntington and in the warehouses of our various distributors located in the leading distributing centers of the country.

Consumers can readily appreciate that with such an organization for the production of nickel, from the ore to the finished mill product, they are assured of a continued supply of a pure rolled nickel of highest quality at reasonable prices.

It is not necessary for users of dairy machinery to go to new and unknown manufacturers for nickel dairy equipment. The same manufacturers and jobbers you have always dealt with can supply you with nickel machines of proved design.

Write for information on any particular Nickel equipment in which you are interested or for further information on INCO Nickel.

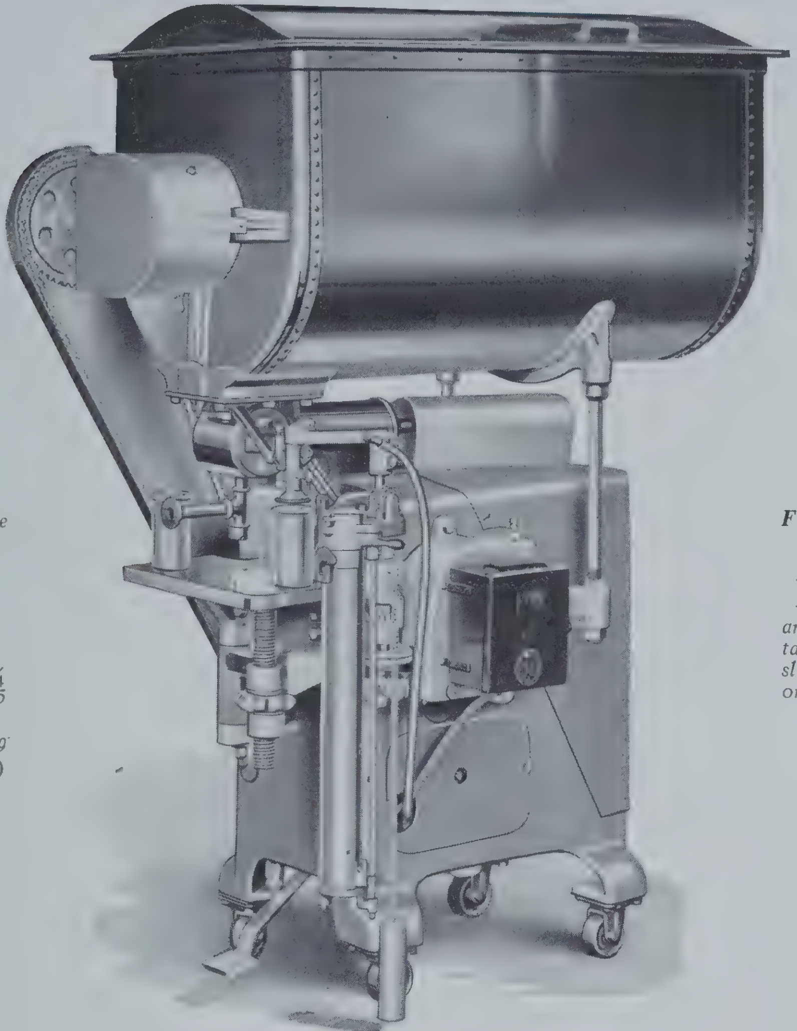
Pure Nickel for Modern Dairies

Mojonnier Cottage Cheese Filler

with mixing and capping mechanism. ***Three machines in one.***

__Fills__ and __Caps__ any one type of the following:
Glass Jars
Standard Milk Bottles
Paper Tubs
Paper Cups
Capacities (8 oz. to 2¼ lbs.) at rate of 15 to 25 a minute.
(Maximum capacity 29 quart fillings per minute.)



Fills—
10 lb. tin pails
5 and 10 lb. paper pails
5 and 10 lb. jars
and other standard cottage cheese packages, at slower capacity depending on size of container.

The Mojonnier Cottage Cheese Mixing, Filling and Capping Machine.

This machine embodies in one machine means of mixing cottage cheese with cream and salt, then filling into cartons, glass bottles or five or ten pound containers. The same machine caps the standard tapered paper containers, or standard glass jar or bottle where the straight disc caps are used.

All parts of the machine are operated by the same motor driven mechanism.

CONSTRUCTION

The mixing hopper is made of *pure nickel*. It is ideal for handling cottage cheese. A positive mixing mechanism of the spiral ribbon type, mixes cottage cheese and cream perfectly. The filling and capping principles are the same as used in the well-known Mojonnier Ice Cream Packaging Machine.

SPECIAL ADVANTAGES

Saves labor. This machine will pay for itself in a short time.

Saves product. Fills measured amounts cleanly into each container. There is no spilling or waste from overfilling. No possibility of air pockets. By keeping the package perfectly clean, it helps increase sales.

This machine may also be used for filling and capping Jewish Cream bottles in one quart, pint or one-half pint sizes.

This machine carries the usual Mojonnier guarantee of absolute satisfaction to user.

Please write our nearest sales engineer for further information.

"durable, economical no metallic flavor"

The advantages of this 500 gallon, Class L, Cherry Twin Coil Machine, with pure nickel lining and coil, recently installed in the plant of the Janssen Dairy Co., Inc., Hoboken, N. J., are emphatically stated in a letter from Mr. F. W. Janssen to the International Nickel Company. Mr. Janssen terms the Cherry vat dependable, durable, economical. He is especially pleased with the fact that there is no discoloration of the vat and no metallic flavor.

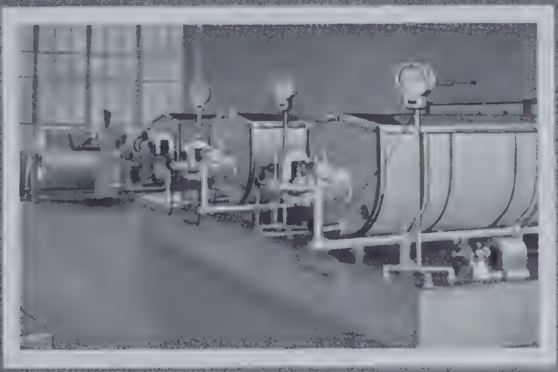
Many other Successes for Cherry Pure Nickel Pasteurizers

Cherry Twin Coil Pasteurizers, with linings and coils of pure nickel, are duplicating the great performance reported by Mr. Janssen in such plants as that of the Farmer's Union Creamery at Fremont, Nebraska, the Farmers Co-operative Creamery Company at Payette, Idaho, the Sanitary Dairy at Cedar Rapids, Iowa, the Battle Creek Sanitarium Creamery at Battle Creek.



Here are the three Class L Cherry Pure Nickel Pasteurizers of the Battle Creek Sanitarium Creamery. One is used for the making of Acidophilus Buttermilk and the other two for pasteurizing milk and cream. The creamery reports that their performance is "faultless."

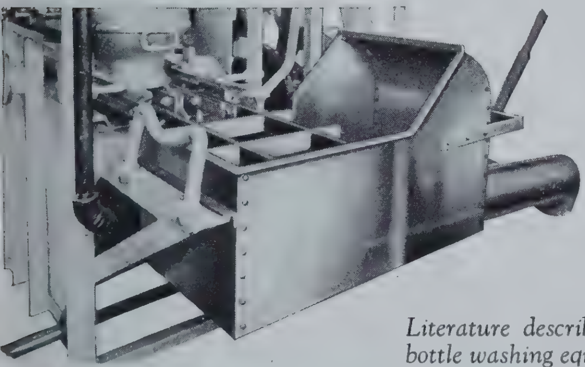
L.-P. Standard Automatic Type B-1 Complete with Dump Tank and Weigh Cans.

.-P. Automatic with Dump Tank

This patented pure nickel dump tank in conjunction with the L.-P. Standard Automatic can washer, is the outfit the dairy world is talking about. This dumping device eliminates the time otherwise lost in waiting for the milk to drain out of the tank—and enables one man to dump the milk, wash the cans and covers [which are replaced] at the remarkable rate of

1,000 lbs. of Milk per Minute.

This pure nickel dump tank is standard equipment on Types B, B-1 and B-2 L.-P. Standard Automatic can washers—with capacities of 12 and 14 cans per minute. The device is a basic patent and is held by the Lathrop-Paulson Company.



We were one of the pioneer dairy machinery manufacturers to recognize the value of and adopt nickel on our equipment.

Literature describing the complete line of L.-P. can and bottle washing equipment will gladly be sent upon request.

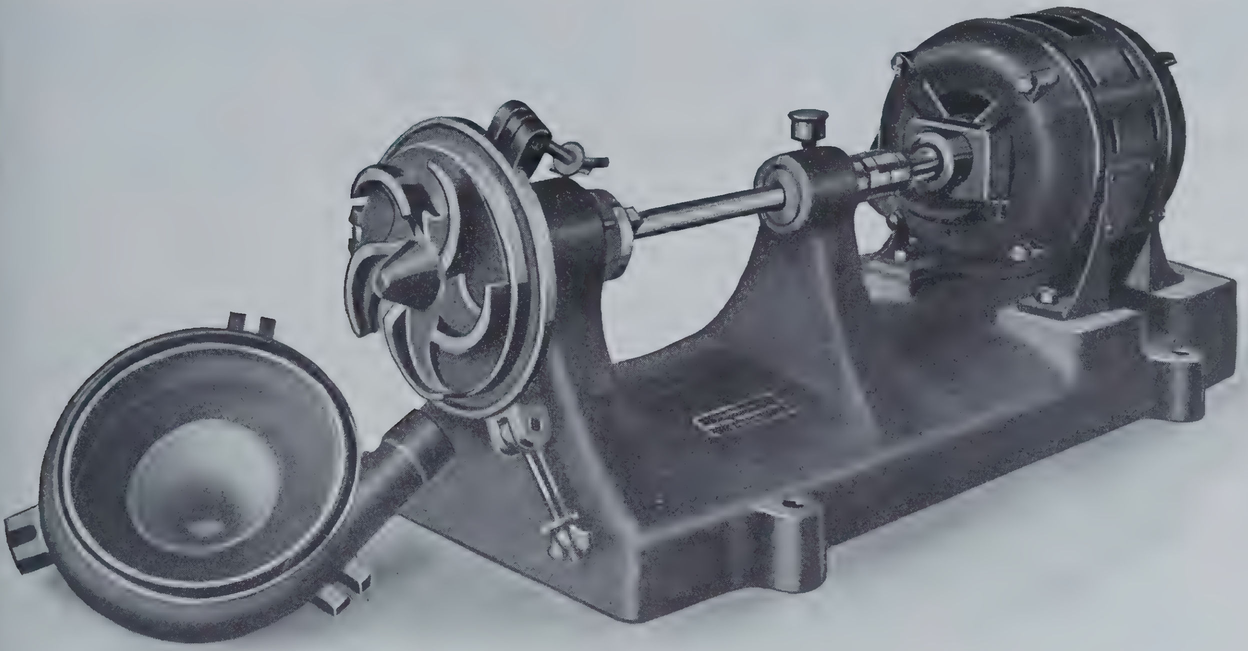
Pure Nickel for Modern Dairies

"FOR BETTER MILK HANDLING"



The shaft is regularly made of Nickel and all parts of the pump in contact with the milk can be furnished of Nickel Composition Castings.

The YORK Milk Pump No. 1

is best for ordinary lifts *because—*

1. ***It can be cleaned easily and thoroughly.***
The above illustration shows how perfectly accessible the pump is for cleaning and sterilizing. By removing only three thumb nuts, you are able to clean every inch without any guess work. There are no cracks or crevices which are hard to get at.

2. ***Has an oilless bearing.***
The shaft at the impeller is provided with a bearing which must be absolutely clean. An oilless bearing does this to perfection. The shaft is made of nickel.

3. ***Does not agitate the milk.***
The impeller has been designed so that it will not agitate the milk as it is forced up. Much milk is wasted through improper handling. The York Milk Pump No. 1 saves milk.

4. ***Is of sturdy construction.***
It is fitted with a noiseless, flexible coupling between the motor and impeller shaft. Regularly furnished for 1″ sanitary tubing connection. Floor space—10¼″ x 27¼″ and 8″ high. Can be had direct connected to motor or belt driven.

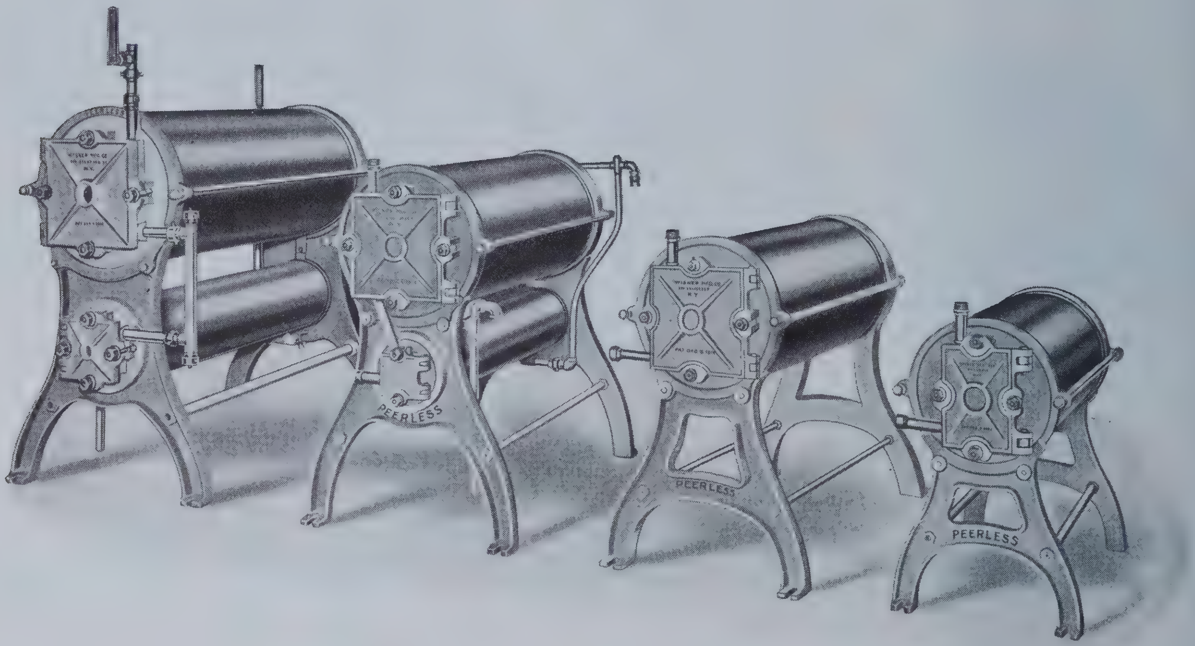
Peerless Approved

Pasteurizers • Positive Holders • Weigh Tank



Peerless Pasteurizers

PEERLESS PASTEURIZERS are sturdily built, operate smoothly, accurately and produce perfect results at all times. All PEERLESS Pasteurizers are made of best obtainable materials, heavily tinned copper and bronze being used throughout. They are thoroughly insulated with finest quality corkboard. Outside jackets can be had in polished copper—tinned copper—pure nickel—or galvanized iron.

Some Exclusive Features of the Peerless Pasteurizer

Heating to desired pasteurizing temperature almost instantly, obviating the possibility of bacteria growth without disturbing the cream line.

Reduces Bacteria count—increases the capacity of milk handled in every plant daily—reduces operating time on each batch of milk a minimum of 20 minutes.

Economical and simple to operate—

Easy to keep clean—

Can be used with any system of pasteurization or any method of holding—

Easy to install—requires little floor space—

Nominal in cost — it reduces operating costs greatly—

A wonderful piece of pasteurizing equipment.

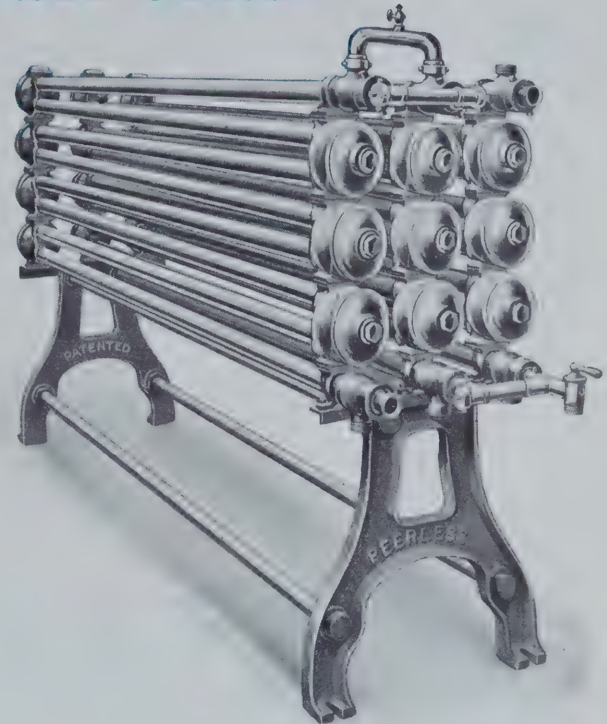
)airy Equipment

Receiving Vats • Internal Tube Coolers • Etc.

Peerless Internal Tube Cooler

The PEERLESS Internal Tube Cooler is identical in ap-
ance to the PEERLESS Regenerative Heater-Cooler but is
t for straight cooling, using water or brine.

The great efficiency of the PEERLESS Internal Tube
ler is due partly to the larger water circulation and the thor-
h mixing of the milk at each end of the tube.



'eatures of the Peerless Internal Tube Cooler

:—No elbows or difficult parts to clean and every part can be thoroughly nspected.

nd:—Only one nut to loosen to remove return cap to each pair of con- necting tubes.

'd:—Positive draining out of all milk from every tube. This is espe- cially valuable in cooling cream or evaporated milk.

th:—Milk thoroughly mixed at each end of every tube insuring better cooling, especially of cream or evaporated milk.

ı:—Great cooling capacity per section, making a less number of sections to clean.

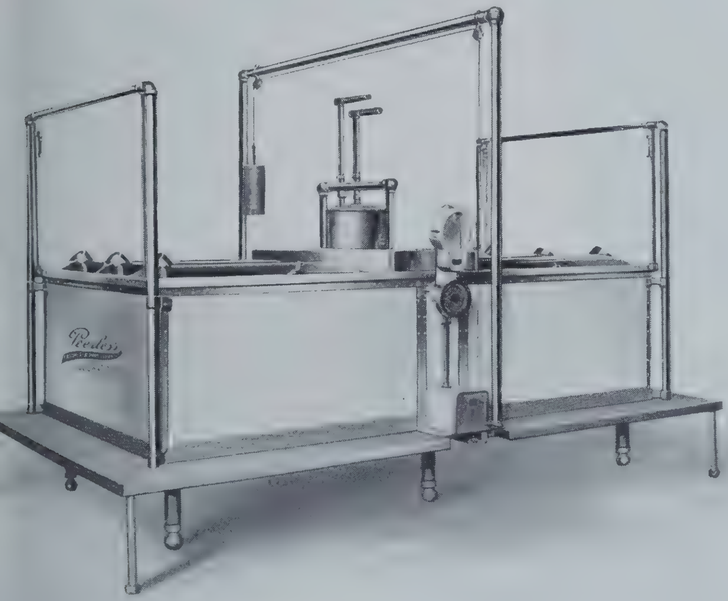
h:—Eight tubes in standard cooler but can be made up of ten, twelve or any even number of tubes desired.

nth:—No possible chance of a leak and water getting to the milk.

ıth:—Compact, requires small floor space.

'h:—The entire cooler is made of copper and bronze, heavily tinned, no iron or steel parts to rust.

th:—Inner tubes can be quickly removed without the services of a mechanic for cleaning water circulation, should same become clogged with sawdust or other foreign matter.



Peerless Automatic Positive Holder

A Mechanical and Scientific Triumph

"BEST by TEST"

1. Positive Holding.
2. Automatic and Continuous.
3. No Power necessary to operate.
4. Holds exactly 30 minutes.
5. Impossible for heated and held milk to intermix, because there are no valves, cross-overs, etc.
6. Sanitary White Porcelain Exterior.
7. Pure Nickel Interior.
8. Thoroughly and properly insulated.
9. Automatic Timing Device.
10. No Foam Filling Device.

The International Nickel Co.
67 Wall Street,
New York City.

Gentlemen:-

Complying with your request, we are pleased to give you our views on the solid nickel Vat which we have recently installed.

Operating a considerable chain of creameries, when installing equipment we are always looking for durability, realizing that if there is any business that requires dependability, it is the milk business. We have to operate our equipment 365 days in the year, and cannot afford to lose any time; therefore, we believe our search for durability is warranted, and for this reason we installed all nickel.

Our experience with this vat has been very satisfactory. In using it for butter milk purpose, we had practically perfect results, giving it a thorough test by leaving the butter milk after it was completed remain in the vat for 48 hours, it leaving no metallic flavor and did not discolor the vat.

Although nickel equipment is more expensive, we really believe it is more economical in the long run, and for that reason we expect to have our future equipment made of nickle, if at all possible.

We would like to say a word regarding the workmanship of this vat, for while nickel is much harder to work, it is therefore to be admired the more.

Very truly yours,
JANSSEN DAIRY CO.
By F. W. Janssen President.

Dear Sirs,

In reply to your communication of August 31 in regard to our experience with our pure nickel lined vats, I will say that since using Burrell Nickel lined vats our bacteria counts have been extremely low, so low that the average milk dealer would not believe it if I gave them our counts. In my opinion there is nothing that will excel nickel lined containers for milk.

Very sincerely yours
E. C. Blake

New York, N. Y.

Gentlemen:

In response to your letter of recent date, asking me what I think of the PEERLESS Automatic Positive Holder which I purchased from you and which was installed in October, I want to say that no piece of machinery which was ever installed in my plant has given me as much personal pride and satisfaction as has this Holder.

It is not only efficient in operation, but it is very easy to clean, and being made of nickel is always bright and shiny, and we have not used any metal polish on it since we have had it.

All of our help like the machine very much, because it does not take a long time to clean it, nor does it take a great deal of effort to clean it.

You might be interested to learn that on some tests which I have had made in our laboratory, I find that the bacteria count is exceptionally low, the holding is absolutely accurate and the variation in temperature, on a day when the thermometer registered below zero, did not show over half a degree drop in any of the compartments.

We cannot speak too highly of this machine. It does everything that you represent it to do and a great deal more, and we feel that we have made an investment that will pay for itself many times over in a very short while.

Answering the closing paragraph of your letter, we wish to advise you that we shall be pleased to permit any one to see this Holder in operation if you will notify us at least a day in advance. Our pasteurizing hours are from 10:30 A.M. to 12:30 P.M.

Yours very truly,
JOHN PAULUS.

Attention: Mr. J. F. McNamara.

Gentlemen:

In reply to your letter of Aug. 31, would say that so far as our experience with the Burrell-Simplex Nickel lined Spray Vat is concerned, we are entirely satisfied with nickel lined containers for dairy purposes. We have been able to maintain a very satisfactory bacterial count over a period of six months, which would indicate that there is no question of sterilization involved.

It is too soon to say about wear and tear, but it is our opinion that the above equipment will stand up under a lot of hard usage.

Yours very truly,

W. L. & R. B. Matthews.

67 Wall Street,
New York City.

Gentlemen:-

The reply to your letter of August 31st was delayed on account of the absence of the writer.

We beg to advise you that we have been well pleased with the Burrell-Simplex Nickel lined spray vat that we using, in fact, it has given us the very best of satisfaction.

I shall hope to have the pleasure of looking over your complete line of Nickel Dairy Equipment at this years Dairy Show.

If you will kindly advise us as to what you believe to be the very best method of cleaning nickel we would appreciate it.

Very truly yours,

Tarbell Farms

NOTE & RETURN

September 15th 1925.

THE INTERNATIONAL NICKEL COMPANY,
67 Wall Street,
New York.

Gentlemen:-

In answer to your inquiry of August 31st inst., we are well pleased with the Burrell-Simplex Nickel Lined Spray Vat. It is an easy vat to clean and with steel wool you can keep the nickel free from the Casein deposit.

We are glad to recommend this equipment to anybody as we feel it is more durable than tinned-copper.

Yours truly,

CENTRAL-SHUEY CREAMERY, Inc.

WACHO *Nickel Lined* Steel Tanks

For safely and economically hauling milk or cream over any kind of road under all conditions. Wacho Nickel Lined Steel Tanks will withstand this hard wear. No jars, bumps or road abuse will affect this tank.

The tank body is made of steel, perfectly welded inside and outside. On the inside pure nickel sheets are welded to the steel so that the two metals become one strong and solid mass.

Tests prove that it is impossible for dents or bumps, no matter how severe, to loosen or peel off the solid sheeting of nickel.

Another important feature of Wacho Milk Tanks is the manhole. Authorities have pronounced it the best and most sanitary cover ever designed for use on milk tanks. It is airtight and prevents dirt and dust or air from contaminating the milk. Wacho Milk Tanks are built in sizes from 500 gallons to 2000 gallons capacity. They are lighter in weight than other metal tanks. The cost is less. Built for all makes of trucks and trailers.

Write for prices and specifications.

Here Is
Representative Burrell Nickel-lined Equipment

HERE is a line of Burrell dairy equipment, already distinguished for its superior features, which has been made still better by the use of pure nickel.

This pure, solid nickel-lined apparatus ensures the greatest possible sanitation—for pure nickel provides a smooth, rust-proof, non-corrosive surface. Milk handled in nickel-lined Burrell-Simplex Storage Vats, Filters, Weigh Cans, Truck Tanks, Coolers and Pasteurizers comes into contact with nothing but clean, smooth surfaces that keep it fresh, sweet and uncontaminated. Moreover, these pure nickel linings have a toughness and durability that match the sturdiness characteristic of Burrell equipment. Pure nickel will not rust, peel, chip or crack—and it has the strength and wearing qualities of steel.

On this page is illustrated some Burrell Dairy equipment which can be supplied with linings of pure nickel. We will be glad to send you complete information about this or other apparatus—without obligation.

laster Craftsmanship
Has Built Pure Nickel *into* Superior Dairy Equipment

Pure nickel is accepted as ideal for the linings of dairy equipment, yet in order to make a substantial piece of equipment from pure nickel, the manufacturer must so construct his apparatus that it will last as long as the nickel itself. This requires experienced workmen, expert engineering—master craftsmanship.

It is significant that Burrell was first to exhibit pure nickel-lined dairy equipment, and probably the first manufacturer of dairy equipment in this country to recognize the value of pure nickel for this purpose. In 1921, at the National Dairy Show, a Burrell-Simplex Spray Pasteurizer, solid nickel-lined, was exhibited. It was the first piece of pure nickel-lined dairy equipment manufactured in this country.

Today the expertness of Burrell engineers and craftsmanship of Burrell workmen have made Burrell the leader in the production of pure nickel-lined dairy equipment—with Burrell apparatus being installed in the finest dairy plants throughout the world.

sanitary and in per-
t working order 365
s a year.

WHEN fresh, sweet milk reaches your plant it is important that you weigh it quickly with a minimum of man power, and with full assurance that your weigh can is not a source of contamination. You will find these requirements carefully anticipated in the design and construction of the

BESTOV WEIGH CAN

You can depend on this device to perform efficiently day after day because it is built to withstand the severe daily service every weigh can receives. Most weigh cans break down quickly because of the constant strain and jolt from the operation of the gate levers. The Bestov however, as illustration shows, is designed so that no strain is transmitted to the body or seams of the can. Solid brass castings extend from the gates up to the levers, making an independent support.

The bottom of the Bestov Weigh Can is pitched and channelled for quick draining. The walls and covers, made in master style of pure nickel provide the utmost in sanitation.

Bulletin 2602 explains every detail; sent promptly without any obligation.

Some More Facts About Metals

Metals Commonly Used in Milk Plant Equipment Cause no Abnormal Changes, it is Pointed Out

By G. N. QUAM and E. I. SOLOMAN*

MUCH work has been done on the effects of certain metals on the flavors of milk and butter. The methods of observation have been varied in some instances the descriptions of procedure have vague. It was during the effort to check some ished results that one of the authors started the y of the effect of metals and metallic oxides on the ge in acidity and rate of spoilage of milk.

s early as 1905, Golding and Feilmann, Jour. of of Chem. Indus. 24, 1285, discovered that milk ed through a partially de-tinned copper cooler aced a "mealy flavor." W. H. Sheffield, Res. Lab. heffield Farms Co., June 29, 1915, observed that copcopper alloys and zinc produced disagreeable flavors ilk at pasteurizing temperature while nickel and had no effect. Similarly Hunziker and Hosman, . of Dairy Sci. 1, 320 (1918), reported the developt of a tallowy flavor and the acceleration of bleachin butter exposed to iron or copper. Nickel and tin luced no such effects. Donauer, Ice Cream Review 3 (1922), stated that metals accelerated the spoilage ilk and that metal in solution beyond a certain perage imparts peculiar metallic flavors. His method rocedure is not clearly indicated and his conclusions rding the effect of metals on the flavor of milk and rate of spoilage may not be applicable to milk at ince it appears that the study of flavors was made water solutions of lactates and the rate of spoilage, prepared metallic lactates dissolved in milk. In former case, milk was not involved and in the latthe composition of the milk was altered. Likewise, solution of lactic acid and citric acid used by Erf, Technical Control of Dairy Products, Mojonnier Troy, page 856, in his study of flavors cannot be to be comparable to milk.

The object of the work reported here was to deine the effect of metals and their oxides on the ge of acidity of whole milk under natural condis and the effect of metals on taste, odor and rate of efactive decomposition of raw whole milk. The les of the metals were also used, since an oxide film ld form on some metals during the processes of hing and steaming as employed in milk plants.

I. The Change of Acidity During Spontaneous Souring of Milk.

The metals used were in sheet form cut into 3" by 3" res and highly polished. The squares were rolled coils and introduced into 500 c.c. pyrex glass Erlener flasks, plugged with cotton and sterilized be being charged with 400 c.c. samples of milk. At rvals, each flask was shaken and a sample of milk drawn to determine the per cent acidity. A flask aining no metal and one containing hard porcelain s were observed in a similar manner for comparison. metals used were the best that could be obtained; copper used was a high grade raw copper, which ld not be confused with tinned copper, and the ial steel contained 17-18 per cent chromium. The nesium used was a pure grade of turnings. Table low indicates the observations made in one of the s of experiments. The temperature was room temperature as comparative results only were sought in this investigation. The column marked Blank indicates that the milk was exposed to no other surfaces than that of the glass flask. It will be noted that the increases of acidity for Blank, glazed porcelain, aluminum, chromium steel, nickel, tin and silver are the same; thus it appears that the presence of those metals caused no change in the rate of souring. Further the development of odor and appearance were similar. The increases of acidity for milk exposed to raw copper, wrought iron and zinc and magnesium were much lower. The milk became slightly colored and developed bad odor from exposure to wrought iron. The magnesium caused the early solution of the curd and the development of a foul cheese-like odor. In general, the retardation of souring seems to be directly proportional to the increase of the rate of spoilage. Table II further verifies the statement above.

Table I. The Increase in Per Cent Acidity (Lactic Acid) of Whole Raw Milk in the Presence of Metals.

Hours exposed	Blank per cent	Glazed porcelain per cent	Magnesium per cent	Aluminum per cent	Zinc per cent	Wrought iron per cent	Chromium steel per cent	Nickel per cent	Tin per cent	Copper per cent	Silver per cent
0	.145	.145	.145	.145	.145	.145	.145	.145	.145	.145	.145
5	.148	.147	.147	.147	.147	.145	.147	.148	.148	.147	.148
12	.151	.151	....	.150	.151	.151	.152	.151	.151	.148	.151
15	.185	.185	.148	.185	.184	.182	.186	.185	.183	.172	.185
18	.327	.326	....	.326	.318	.289	.327	.326	.326	.249	.327
20	.51	.513	....	.515	.50	.43	.515	.51	.501	.345	.515
22	.69	.69	.41	.690	.68	.60	.70	.685	.685	.48	.685
25	.78	.785	....	.775	.71	.70	.78	.775	.77	.62	.78
27	.79	.79	.55	.79	....	.76	.785	.785	.78	.72	.79

The observations on the effect of oxides of the metals on the change of acidity could not be made complete. The oxides of nickel and tin had no effect on the change of acidity of souring milk while the oxides of aluminum, zinc, wrought iron and raw copper greatly retarded the rate.

Table II.—The Increase in per cent Acidity (Lactic Acid) of Whole Pastuerized Milk in the Presence of Metals.

Time hours	Temperature °C	Blank per cent	Nickel per cent	Tin per cent	Chromium steel per cent	Wrought iron per cent	Copper per cent
0	27	.145	.145	.145	.145	.145	.145
5	25	.151	.146	.151	.152	.145	.147
12	24.5	.151	.147	.151	.152	.157	.148
15	25	.185	.182	.183	.188	.187	.172

23.5	27	.74	.74	.73	.750	.69	.55
25	26.5	.76	.76	.73	.75	.71	.62
27	26	.79	.78	.78	.78	.76	.72
29	26	.80	.795	.78	.79	.77	.74

III. Effects of Metals on the Putrefactive Decomposition of Milk.

In the study of the change of acidity it was observed that certain metals seemed to hasten the putrefactive decomposition of the raw milk to which they were exposed. The samples were prepared as described above and odor and taste tests were made at intervals for

---

Chemistry Department, Coe College, Cedar Rapids, Ia.

nine days. Magnesium caused the most pronounced change. On the second day the curd had been converted to a whey-like solution and a bitter taste had developed. On the third day the odor was like that of decayed cheese. Wrought iron developed a pungent, sour odor and an acid, metallic taste, in the milk to which it was exposed. Copper likewise early developed signs of putrefactive decomposition. Lead and zinc seemed to have a slightly opposite effect; the milk exposed to lead, developed a sweetish sour taste. Milk exposed to nickel, chromium steel and tin was not affected by the metals as the changes observed were the same as with milk not exposed to any metals. The latter would also be true of properly tinned copper. For the metals effecting more rapid spoilage of milk, the order found was: Magnesium, low carbon steel, copper, wrought iron and aluminum. The effect of aluminum was practically ne ible. It is difficult to classify lead and zinc as putr tion was much retarded, apparently due to the ant tic properties of salts formed from these metals.

IV. Conclusion.

The observations reported above verify the s ments of some investigators regarding copper and but it is evident that the sweeping statements reg ing the general effect of all metals on spoilage are well founded. Nickel and chromium steel (of the g used) and tin do not appear to cause any change o properties of milk and therefore, as far as the obse tions reported above are concerned, are apparentl inert toward milk as the containers used: namely, p glass.

That 1926 Inventory

By FRED E. KUNKEL

THE beginning of a new year's business brings to every progressive dairy-products merchandiser a resume of last year's activities in retrospect as "Inventory Time," only in a different way from the ordinary stock-taking and book-analysis methods, or striking off a profit and loss statement.

One dairyman last year found it a good plan to make this event a time for contemplative thought — a fitting moment in which to review the twelve months which had just passed—a survey with both a personal and a business aspect.

And in going over those memorable ledger sheets of time itself he found ample food for serious reflection. Based on the achievements of the past he speculated on conquests for the future. It was a constructive moment, pregnant with tremendous possibilities, if only he could manipulate it in just the right way.

So, in his inventory-analysis, he jotted down some of the salient phases of his business, such as "bill paying," including credit and collection problems, advertising program and an analysis of "why not use more direct mail?" since results in the past had fully justified it, and how to build up a corking good mailing list, a study of his newspaper advertising and whether more constructive effort should be put into this in the future; delivery methods, or how to simplify and short cut effort, the wisdom of hiring and firing incompetents, etc.; service and business-building, or how to handle telephone calls at all times with good salesmanship spirit, how to promote a friendly feeling between the customer and the house, how to do little favors which make the customer feel like coming back again and again, little stunts which helped along publicity, etc.

All of these little ideas he pulled out of cobwebbed cubby holes, dusted them up, gave them an airing, with the net result that the year just closed proved one of the best in history, and he does not by any means attribute it solely to business conditions either or to natural prosperity.

This dairy products merchandiser feels that as a result of making a "**mental**" inventory of his business accomplishments in the past from the purely "**personal**" side of it, that he had made rapid strides progressward, and he is now a firm believer in letting each month of January and the New Year be a contemplative occasion for constructive sales and business management analysis, with a view to detecting the weak spots in his orga tion, the missing links which complete the chain, the ten parts in his business which need to be consigne the scrapheap and sacrificed on the altars of progre

To sell more milk, cream, butter, cream cheese, termilk, ice cream, and other dairy products from to year—that's the altruistic aim of this aggressive dealer—and by taking a careful inventory of his accomplishments he is enabled to prepare a real he business-building program for each New Year.

One religious principle of this milk dealer is to tig up on his accounts. He doesn't believe, like he use of letting the customer run way behind for no good son at all, and then get all "het-up" of a sudden when he didn't pay his bills when reminded of that past due account. He now finds that by keeping customers in a nice way long before they become l lessly delinquent, that he does not have nearly so r trouble collecting his bills.

All milk dealer problems, if thought about and lyzed, present ample food for constructive reflectio taking an accurate inventory of "what happened" year, and then building up your sales-pyramid of cess for next year on the ashes of past experiences.

NEW HOME OF HISE DAIRY PRODUCTS C

Some time in March the new home of the Hise D Products Co. at Joplin, Mo., will be completed.

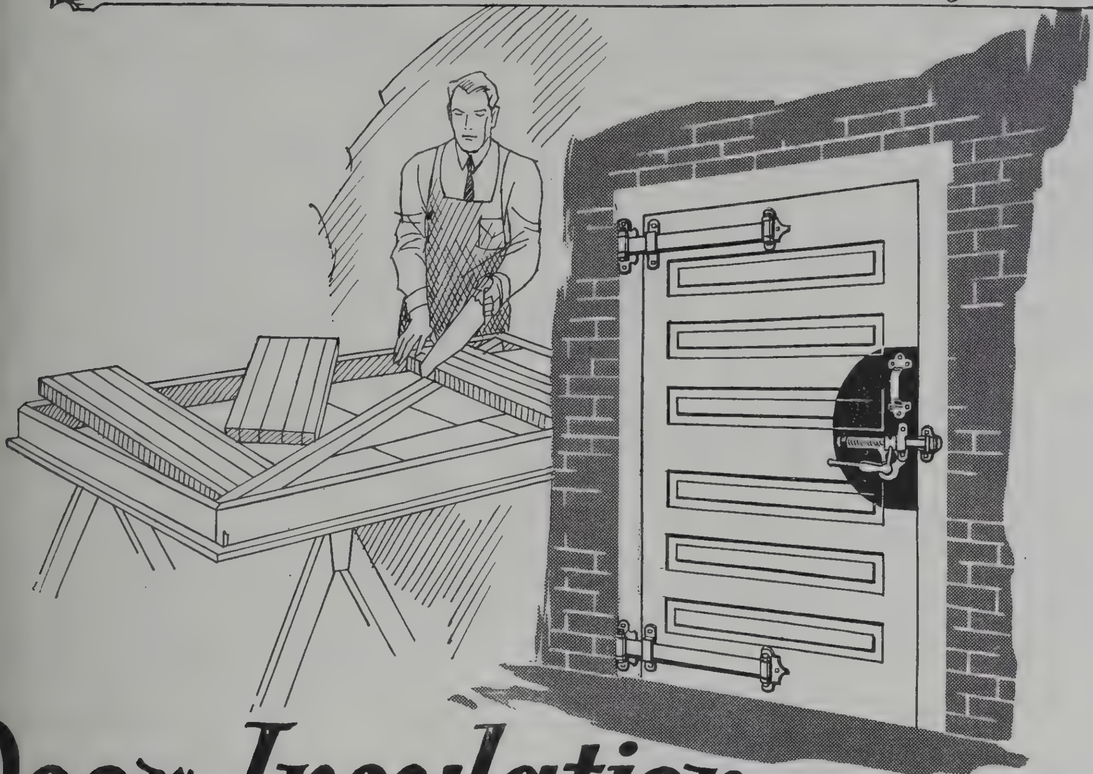
The new building will be of hollow tile construc one-story, with a two-story front, and will be fin in white stucco, with a green tile shingle roof. Th sign, presenting a symmetrically windowed front, is ilar to that used in stucco buildings of a late ty Eastern cities.

The structure is to occupy a space 40x100 feet, a 50x110 foot lot adjoining on the north also is a pa the property, but for the present will be held in res The total cost of the property and building will b proximately $20,000.

A unique feature of the new plant is a large obs tion window which will look down upon the plant i rear from the auditorium, which will be in the part of the upstairs floor.

The company's capacity is expected to be incr from 10,000 to 20,000 pounds of milk a day.

FACTS ABOUT COLD STORAGE DOORS ~ No. 2 of a Series



Door Insulation ~ is as important as wall insulation

YOU would never take chances on the insulation of the walls of your cold storage compartments. And the insulation of your doors is equally important. Whether through walls or doors, temperature losses are always exceedingly expensive.

So in buying cooler or freezer doors, never select doors insulated with anything but those materials that have proven their value over a reasonable period of time. And this insulation should be of the same kind and thickness as used for the wall in which the door is installed.

Use Jamison Doors, and you'll know your doors are as well insulated as your walls. In Jamison Doors only standard, time-tested insulating materials are used. These materials are always tightly packed and fitted in the door, and carefully sealed against moisture and dampness with hot asphalt or waterproof insulating paper.

Install Jamison Doors, and be sure of full protection.
Send for our catalog, giving all the facts.

Municipal Control of Milk Supplies

Rockford, Illinois' Health Official Suggests Novel Score Card for Appraising the Milk Supply of a City

A QUESTIONNAIRE prepared in the office of the Rockford, Illinois, Department of Public Health, N. O. Gunderson, M. D., commissioner, presents a series of questions and answers which serve as a guide in "scoring" a city's milk supply. It is illustrated by forty small drawings arranged to spell out the word "Milk." Each drawing counts for 25 in the total of 1,000.

Milk dealers, health officers, and all others interested in bettering a city's milk supply will be interested in this novel presentation of the factors involved. The questions and answers are as follows:

1. Has an appraisal form been prepared for judging the sanitary status of the milk ksupply of the city?

A compresentive systematic milk campaign cannot be instigated in a city unless the health department knows what the particular local problem is. One method of learning this problem is to make out an appraisal form.

2. Has the health officer outlined a definite program for the milk inspector?

Having appraised the local milk supply, the health officer with the aid of the state health department can outline corrective measures for improving the quality and safety of the milk.

3. Are detail records kept of all field inspections?

It is essential that an index file system be prepared containing detailed records of all producers, dairies, employees, equipment, general methods, and records of laboratory, reductase, and sediment tests.

4. Has the need of a milk ordinance been explained to the public?

If a city does not have an effective milk ordinance, all local civic organizations and the public at large should be informed of its need in protecting the health of infants, school children and adult population of the city.

5. Has an ordinance conference been held with the board of health, the city attorney and city council?

Backed with field findings obtained through the appraisal form and the endorsement of the public and local civic organizations, the health officer seldom experiences any difficulty in getting the city council to adopt the state model milk ordinance.

6. Is all milk in the city pasteurized except a small amount of certified?

The only safe milk is pasteurized milk. The producer can furnish clean milk, but the only sure protection against the transmission of certain communicable diseases from the silk milker or bottler to the consumer, is proper pasteurization.

7. Has a T. B. testing program been inaugurated?

Medical authorities, veterinarians and milk sanitarians advise that all herds should be tested for tuberculosis because this procedure aids in eradicating bocine tuberculosis from the community

8. Does the health officer keep a record of all t herds?

It is essential that records be kept of all tested h that a time limit be set for testing, and that exclusion o be applied to those producers who have reacting cows.

9. Has the health officer a definite farm inspection gram?

Farm inspections may be carried on by the healt partment, the milk plant owner or a milk producing as tion, but the milk inspector should supervise and keep records as to efficiency.

10. Have means been devised for raising funds for inspections?

The health department in order to assure a clean, supply of milk should know how funds can be raise carrying on this work.

11. Are the milk inspectors properly trained to do inspections?

A corps of trained milk inspectors can be forme proper schooling under a trained, experienced veterinari

Does the health department support a remote farm trol program?

All milk producers will instigate any and all measur sanitation if they thoroughly and specifically understan reason for same. So, does the health department carr the following:

12. Are instructive pamphlets, letters and circulars to the producer?

Easily carried out if health department has a mi graph machine.

13. Are grange talks, lectures and demonstrations ried on?

This is a direct means of reaching the producer.

14. Does the health department have milk exhibi annual county fairs?

Very helpful and instructive.

15. Are radio talks given for the producers?

Can be done through a co-operative state and city gram.

Have dairy owners inaugurated a co-operative pro with the producer?

Dairy plant owners can aid materially by inaugur co-operative measures that deal with the following:

16. Are whitewash crews organized at a nominal c the producer?

Whitewash crews can be sent out by the plant owne spray cow stables and thus keep them clean, presentabl sanitary at a nomical cost when they are all done at one

17. Is a bonus offered the producer for good milk?

Milk plant owners can improve the quality of brought to the plant by paying a bonus on butterfat, ment free milk, keeping quality of milk as shown by th ductase test, proper temperature and T. B. tested herds

18. Is an inspection made of all milk and milk ca the receiving platform of the dairy?

This phase of milk work consists of testing the tem ture, taste, odor and color of the milk, checking the q by the reductase test or laboratory methods, and notin cleanliness by the sediment test. Milk cans should al

inspected to see if they are of proper construction, free from dust, no broken seams and perfectly clean.

19. Are dairy plant owners permitted to use condemnation cards?

Many gallons of unfit milk enter a city dairy, which should be condemned. For this work condemnation cards bearing the name and seal of the health offcer can be placed in the hands of the plant owners, and then checks made of all condemnations to see if they are justified; also, corrective measures instigated at the farms.

20. Are all the dairy plants of proper construction?

...This takes into consideration proper buildings, good ventilation, sufficient light and an adequate, efficient system for the disposal of waste.

21. Is the water supply safe?

All dairy equipment, utensils, cans, and bottles are rinsed with water which should be of safe, sanitary quality.

22. Is all the dairy equipment of approved sanitary type?

Under this item comes adequate, efficienely arranged equipment, sufficient steam, recording thermometers, mechanical refrigerators, automatic bottlers and cappers, sanitary piping, automatic can and bottle washers and driers, and approved pasteurizers with no blind pockets, foam, splash, or air pockets.

23. Are the plant methods conducive to the production of a safe, sanitary quality of milk?

Under this item is considered clovenly plant operators, whether all equipment is cleaned and sterilized daily, whether all milk cans are dried after pasteurization, if the milk is filtered before instead of after pasteurization, and whether all cold pockets have been eliminated in the pasteurizatoin equipment.

24. Are physical examinations required of all dairy employees?

These are done for the purpose of locating chronic carriers of disease among the employees.

25. Are laboratory tests made of employees?

This is paramount to determine if any of the plant employees are typhoid, diphtheria, streptococcus sore throat, or tuberculosis carriers.

26. Is all equipment dismantled and sterilized after each day's run and then stored in a place free from contamination?

This item is highly essential to keep the milk sweet, free from odor and free of pathogenic bacteria.

27. Is the plant boiler capable of supplying sufficient steam at all times?

An abundant supply of steam is necessary at all times in order that all equipment may be properly and efficiently sterilized and pasteurization carried on at the proper temperature.

28. Are milk cans properly dried with hot air after sterilization?

Excessive bacteriological counts, disagreeable odors, peculiar tastes, and color can be eliminated by carefully drying milk cans and piping with hot air after sterilization.

29. Have all cold pockets been eliminated in the pasteurization equipment?

It is essential that all pasteurization vats be provided with flush type valves, that splash, foam and air pockets be eliminated so that every particle of milk can be heated to the required temperature and holding time of thirty minutes.

30. Are all thermometers checked with a master thermometer?

It is essential that all the thermometers in a dairy and especially the automatic recording type be checked periodically with a master thermometer that has been checked by the U. S. Bureau of Standards.

31. Is all milk iced on the delivery wagons in the summer?

This is to assure all milk reaching the customer's doorstep at the proper temperature.

32. Are laboratory efficiency tests conducted on all the dairy plant processes?

Of late, milk sanitarians have come to recognize the great benefit derived from conducting laboratory tests on all the processes because they show the percentage of bacteria killed by pasteurization and also where plant deficiencies exist.

33. Are laboratory checks made of all sterilization processes?

Laboratory checks are necessary on milk bottles, cans and equipment after they are sterilized to determine if it is efficient.

34. Are weekly laboratory tests conducted on the finished milk product?

Laboratory tests of butterfat, preservatives, water dilution, sediment, and number of bacteria of the milk is another criterion for judging the safety and food quality of milk.

35. Are automatic recording thermometer charts sent to the health department weekly?

By examining these records periodically the inspecto tell whether the milk is properly pasteurized or not.

36. Does the health department have a good library

To do effective work all the U. S. P. H. S. milk bull

To do effective work all the U. S. P. H. S. milk bulle good text books, and latest research reports should be a able to the health officer and his assistants.

37. Does the health department have a mimeog machine?

Extensive publiciay and educational work can be ca on when one has access to a mimeograph machine.

38. Are milk articles prepared for the daily press?

This is one of the greatest and most effective aids a h officer has for carryingi on a milk program.

39. Does the health officer and milk inspector a conventions?

Attendance at annual conventions is highly essent one is to keep abreast of all new procedures in the game.

40. Does the milk inspector work under the follo suggestions?

Salesmanship is necessary in health department wo elsewhere and calls for good general principles, a fe which may be:

...a. **Pursuasion is better than force.**
b. **Instruct, do not boss.**
c. **Cannot instruct unless well grounded in subject.**
d. **Clean, safe milk is better than cleaned, safe milk**
e. **Remember that milk plant owners know milk gar well as health department.**

NEW JERSEY GOVERNOR FAVORS STANDA MILK REGULATIONS.

In his first annual message to the legislature, w convened January 11, for the 1927 session, Gove Moore recommended, among other things, the ado of a uniform milk standard. Said the governor:

"Milk is a product which is of vital importance to ou ple. The farmers of our state are endeavoring, and suc ing, I believe, in furnishing a pure and wholesome su They are greatly hampered, however, by the fact that municipality sets up a standard of its own, thus maki difficult for the farmer to meet all of the individual dem

"A general standard should be set, and it seems t that if your body, in its wisdom, would appoint a comn to look into the matter, with the end in view of gettin the health authorities to agree upon a standard progra would facilitate the farmer and insure a stable conditi this highly important field.

"There are other matters to which I shall call your a tion as occasion may demand."—Trenton (N. J.) Time

Theories About Pasteurization of Milk

Past and Present Theories—Pasteurization and Vitamines—Pasteurized Milk for Infants—The Necessity for Pasteurization. Facts the Milk Dealer Should Know

PASTEURIZATION at present is looked upon with favor by medical men, sanitarians, dairymen, and consumers, but the art has not been developed without opposition, and its value is not universally accepted. Most of the objections to pasteurized milk have been based on theory, or on experiments in which milk was pasteurized at high temperatures. In view of our modern theories they are of no great importance.

One of the greatest objections to pasteurized milk has been that the heating destroyed the lactic-acid bacteria and that putrefactive organisms were left, which, when relieved from the restraining action of the acid-forming bacteria, would develop, forming toxins and putrefactive products. It was believed that the milk, because it was not sour, would be consumed in that condition. This objection was based on experiments in which milk was heated to temperatures near the boiling point and can not be applied to milk pasteurized at low temperatures. From the results of many years' work in the bureau of dairy industry on commercial pasteurized milk, it has been found that such milk sours, as raw milk does, but that the souring is delayed when compared with the souring of the same grade of raw milk. Pasteurized milk sours in a manner similar to that of a high grade of raw milk, and there is no more reason to fear the overgrowth of putrefactive organisms than there is in any high-grade milk. Pasteurization for 30 minutes at temperatures of about 145 degrees F., as is generally practiced in this country, does not destroy all the lactic acid organisms, and those which survive play an important role in the souring of commercially pasteurized milk.

Another objection to pasteurized milk has been that bacteria grow faster in it than in raw milk. In spite of several experiments which seem to prove this point, it has never been thoroughly established. It has been found that the rate of bacterial increase is approximately the same when the comparison is made between raw milk and pasteurized milk having about the same bacterial content.

It is often stated that pasteurization, even if it does destroy bacteria, does not destroy poisonous products of their growth. This can hardly be considered a real objection, for if they are present in raw milk they must be consumed with it, and if pasteurization does not destroy them the pasteurized milk would be no worse than raw milk.

The question as to whether pasteurization destroys beneficial enzymes is still an open one. In the light of our present knowledge of the enzymes in milk and the part they play in the digestive process it is quite impossible to settle the question of their importance. It is evident, however, that the low temperatures now in use in pasteurization have little effect on the commonly recognized enzymes.

Does Pasteurization Cause Lax Methods?

The opponents of pasteurization have raised an objection on the ground of its direct influence on the milk producer. It has been asserted that pasteurization would cause lax methods of production on the farm, for the reason that farmers would know that the milk was to be pasteurized and, therefore, they could be careless in its production. There seems to be some basis for this objection, but in any city where there is any inspection of the raw milk supply the same inspection can a
should be continued even though the milk is to be p
teurized.

From a chemical standpoint serious objections h
been raised against pasteurized milk, because the heat
produces changes which render the milk less digesti
particularly in the case of infants. However, Rupp
found that milk pasteurized at 145 degrees F. for
minutes does not undergo any appreciable chemi
change. He found that soluble phosphates do not beco
insoluble, that the albumin does not coagulate, and t
when higher temperatures are used chemical changes
occur. He also developed the fact that five per cent
the albumin is rendered insoluble in milk heated for
minutes at 150 degrees F., while at 160 degrees F. 30
per cent of the albumin is coagulated. Further eviden
that low-temperature pasteurization does not injure
digestibility and nutritive value of milk are shown
the results of feeding experiments with babies. Acco
ing to Weld a number of babies that were fed raw m
and pasteurized milk showed only a slight difference
the average net daily gain in weight during the feed
period. The slight difference was in favor of pasteur
milk. Hess, however, has found that milk pasteur
for 30 minutes at 145 degrees F. may cause, in infa
a mild form of scurvy, which yields readily to so sim
a remedy as orange juice.

High-temperature pasteurization of earlier days m
not be confused with low-temperature pasteurization
the present day. Many of the objections which h
been raised to pasteurization have been founded on
observation of milk heated to high temperatures.
fallacy of the objections to pasteurization have b
shown, however, through scientific research in the
few years, and as a result the value of the process
been firmly established.

Pasteurization and Vitamines.

The discovery of vitamines within recent years
shown how impossible it is to estimate nutritive requ
ments solely in terms of digestible protein, carbohydr
fat, and inorganic salts. Little is known of the real ch
ical nature of vitamines, but they are necessary for
mal growth and health.

Five vitamines are now recognized—known as v
mine A (soluble in fat), vitamine B (soluble in wat
the antiscorbutic vitamine C, the antirachitic vitamine
and a vitamine concerned in reproduction originally
ignated X but now known as E. A and B are compa
tively abundant in milk, while C is present in small q
tities only. D and E evidently do not occur in milk
sufficient quantities to make it an important source
these vitamines.

Because of the limited character of the infant's
the vitamine content of its food is more important t
that of the adult's, as the latter has a great variety
foods.

Fat-soluble A and water-soluble B have been fo
to be quite resistant to heat, and it is agreed that
teurization has little or no effect upon them. The a
scorbutic vitamine C, however, is quite sensitive to h
above 122 degrees F. While the destruction of this v
mine depends upon the temperature, length and co
tion of heating, as well as upon the reaction of the

You won't even *soil* your handkerchief!

IF you want to know how *absolutely thorough* Oakite cleaning is, wash one of your cans the OAKITE way. Then rub a handkerchief over it. Either inside or out. Result —you won't even *soil* your handkerchief.

That is what you want, isn't it, clean, sanitary cans, which help to safeguard the purity of your product and reduce bacteria count.

The steadily increasing demand for Oakite in dairies, creameries, and ice cream plants is entirely due to its ability to clean quickly, *thoroughly*, with less effort and to increase profits through saving money.

There is a lot of interesting information for washing milk cans, bottles, holders, separators, pasteurizers, coolers, and other equipment in the booklet "Oakite in Milk Plants." Write for your copy; or ask for our Service Man in your locality to call. No obligation.

OAKITE IS MANUFACTURED BY

TRADE MARK REG U S PAT OFF
Industrial Cleaning Materials and Methods

terial in which it exists, there seems to be little d
that pasteurization of milk, under usual commercial
ditions, at 145 degrees F. for 30 minutes, weakens
antiscorbutic property of the milk.

Hess and Fish, in 1914, in studying scurvy in
dren found that some cases of scurvy developed w
milk was used which had been pasteurized at 145
grees for 30 minutes.

After further studies on this subject Hess made
following statement:

> "Although pasteurized milk is to be recommended o
> count of the security which it affords against infection
> should realize that it is an incomplete food. Unless anti
> butics, such as orange juice, the juice of an orange pee
> potato water is added, infants will develop scurvy on this
> This form of scurvy takes some months to develop and
> be termed subacute. It must be considered not only the
> common form of this disorder, but one which passes
> often unrecognized. In order to guard against it, infants
> exclusively on a diet of pasteurized milk should be g
> antiscorbutics far earlier than is at present the custom,
> as early as the first month in life.
>
> "In the course of the development of infantile sc
> growth both in weight and in length is markedly affe
> Under these conditions weight ceases to increase, and a
> tionary plane is maintained for weeks or for months. T
> is quick response, however, on the administration of or
> juice or its equivalent; indeed supergrowth is thereupon
> quently manifested."

Pasteurized Milk for Infants.

A rational view must be taken of the use of past
ized milk. Shall the protection against infection, w
is made available by the proper pasteurization of m
be discarded because of its deficient antiscorbutic p
erty, or shall its protection be accepted and the deficie
in vitamine C be made up by feeding orange juic
other antiscorbutics?

Perhaps the feeding of infants calls for even fur
thought than is generally given. As Eddy points
there are two points to be kept in mind in infant n
tion. The first is that the vitamine content of cow'
human milk is dependent primarily on the food e
by the producer of the milk. In other words, mil
merely a mobilization of vitamines eaten, and if the
is to yield a milk rich in vitamines the food eaten m
also be rich. He further points out the fact that cer
are poor in vitamines and green grasses rich in th
and that this brings up the question of winter feedin
the milk supply is used for infants, and he suggests
the variability in vitamines A and B in milk may
times make it necessary to supplement the diet.

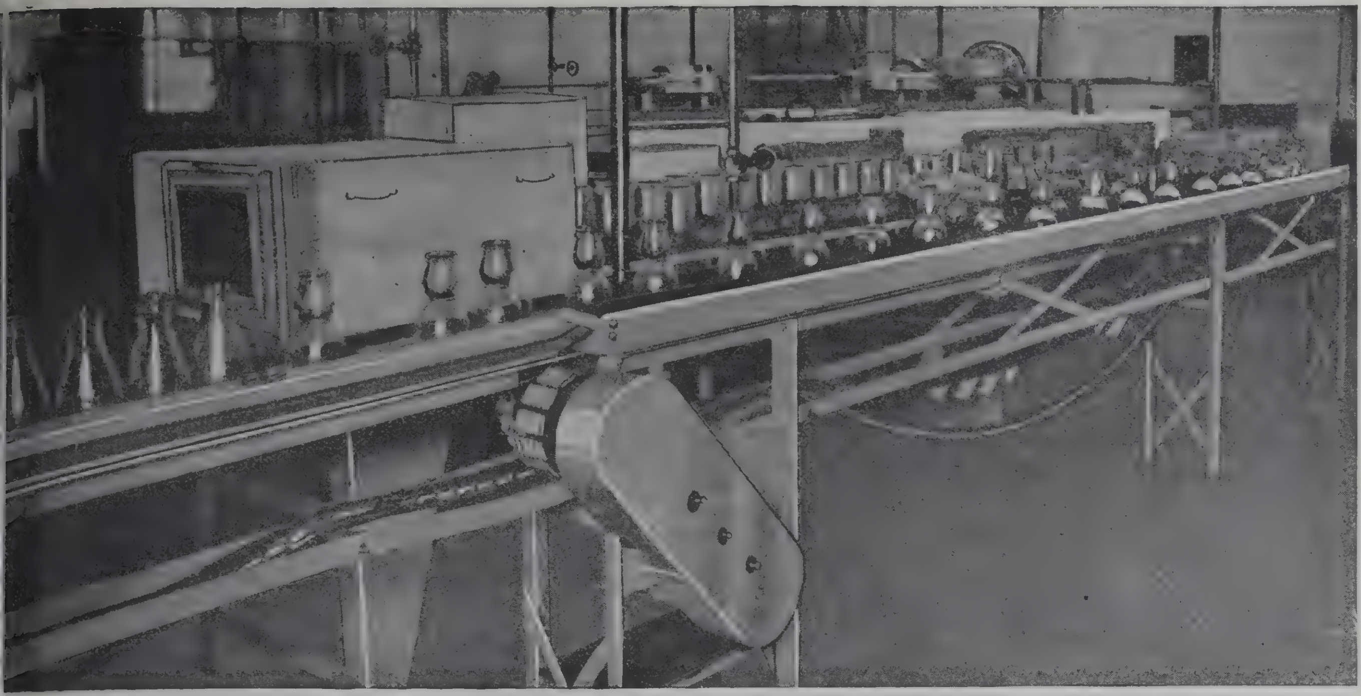
The second point brought out by Eddy expresses w
appears to be the most reasonable attitude toward
use of pasteurized milk for infant feeding, accordin
our present knowledge of vitamines, and it is there
quoted:

> "The second point in regard to milk lies in the effec
> pasteurization. This measure is now well-nigh universal
> in America at least has played a tremendous part in the
> duction of infant mortality, especially in the summer mon
> At present, however, we know that this treatment while
> moving dangerous germs may also eliminate the antiscorb
> factor. The sensible attitude then is to recognize this
> and if a clean whole milk is not available retain the past
> ization and meet the vitamine deficiency by other ag
> Such agents are orange juice and tomato juice, and exp
> ence has already shown that these juices can be well toler
> by infants much earlier than used to be thought possible

It seems, therefore, that the only serious effect of
teurization on the vitamines is on the antiscorbutic v
mine C, and it is evident that the feeding of orang
tomato juice, or other antiscorbutics, readily makes
for the deficiency of this vitamine in pasteurized m

The Necessity for Pasteurization.

The need for safeguarding the milk supply is am



View of a Miller installation at the Esmond Dairy, Sandusky, Ohio

Chemically Clean Bottles —At the Lowest Cost

IN the Miller Hydro there are no germ-laden brushes to contend with . . . no delicate mechanism . . . no parts that easily wear out with the brushes. Instead, this mechanically perfect soaker year in and year out goes regularly about its business of producing a continuous stream of chemically clean bottles at almost fifty per cent less washing cost.

The Miller Hydro can never wear out. No one has ever discovered a worn-out Miller Hydro even though 3500 machines are in daily use. It is built to give a lifetime of bottle-washing service free from any sort of expensive brush mechanism.

If you consider that the work of a soaker is to polish and scour every dirty bottle to a thorough degree of sterility at the lowest possible cost . . . then you owe it to yourself to install a Miller Hydro. It will soon pay for itself out of wasted profits and the satisfaction it gives will be worth ten times the reasonable purchase price.

Write us today for catalog and names of large dairies who have tested the Miller Hydro under every condition.

proved by the numerous epidemics traced to milk. Trask reported 179 epidemics of typhoid fever from 1881 to 1907, of which 107 were in the United States, 51 epidemics of scarlet fever, including 25 in this country, during the same period, and 23 epidemics of diphtheria from 1879 to 1907, including 15 in the United States. These were all traced to milk. He also listed seven epidemics of sore throat, most of which occurred in England. Since 1907 several epidemics of septic sore throat have been traced to milk. Among these may be mentioned the epidemics at Boston, Chicago and Baltimore, and others which have occurred in smaller cities.

The problem of pasteurization is not based simply on the question of which is preferable, raw or pasteurized milk, but rather upon the most economical and practical way of producing a safe milk supply.

In connection with the possibility of transmission of disease through the agency of milk, certain fundamental facts must be recognized.

1. That such possibilities exist, as demonstrated by epidemics of the past.

2. That certain diseases transmitted to man, such as tuberculosis, may come from diseased animals. The danger from this source can be prevented by the elimination of tuberculous cattle from producing herds on the basis of the tuberculin test.

3. That the freeing of the herds from tuberculosis offers no protection against other diseases, as typhoid fever, diphtheria, and septic sore throat, because the pathogenic organisms causing these diseases may come from infected water supplies or probably in most cases from human carriers disease.

The term "carriers" is used to designate persons w carry the disease-producing bacteria. In the case diphtheria, carriers harbor the diphtheria organisms a discharge them from the note and throat. Typhoid ca riers discharge typhoid bacilli in their feces or urin Diphtheria carriers may become so after having an acu attack of the disease or from other carriers. Typho carriers are particularly important, because from 2 to per cent of the persons who have typhoid fever continu as evidence shows, to discharge the typhoid bacilli their feces or urine or both and become chronic carrie

Persons suffering from sore throat are a menace the milk supply, and probably the organisms responsil for septic sore throat are sometimes carried in the thro of apparently normal individuals.

It is manifestly impossible to have a medical exa ination of all persons engaged in producing and handli milk. Yet such examinations at frequent intervals wou be necessary, together with tuberculin testing and t assurance of unpolluted water supply on every farm order to safe-guard the milk supply of the nation the same extent that is now possible by proper pasteu zation. The appreciation of the need for pasteurizati is distinctly shown by the marked increase in pasteuri tion in the United States.—Extracts from Bulletin N 342, U. S. Bureau of Dairying.

CONTROL OF RETAIL ROUTES.

W. S. Lucas, Chicago, Ill.

An efficient manager wants to know if for every dollar's worth of sales made, a dollar has been turned in to the office. While the reports and amounts of cash turned in each day are of importance in the regular routine, they do not disclose certain facts which a manager must know to operate his business efficiently.

Sometimes, for various reasons, the route-rider or route-foreman is unable to make his usual "rounds" for an extended time and some salesmen get to be lax with their collections, too lenient with their customers, or, as occasionally happens, default in collections. This is especially true in the smaller organizations, where the route-foreman is given other duties, and not sent out for several months at a time.

During my experience as a public accountant for number of concerns, I evolved a monthly report, like t one illustrated, which proved to be of considerable valu especially to the smaller concerns, operating up to wagons.

It is seen from the illustration that for the month March salesman No. 1 collected $70.20 less than his tot sales for the same period, (Column "E"), and that f the first three months of the year the collections a $99.45 behind schedule, (Column "F").

Comparing the increase of route No. 1 against t others it is safe to say that this route in subject to i vestigation for the unusual increase in the outstandi balance.

A further study of the report is practically se explanatory.

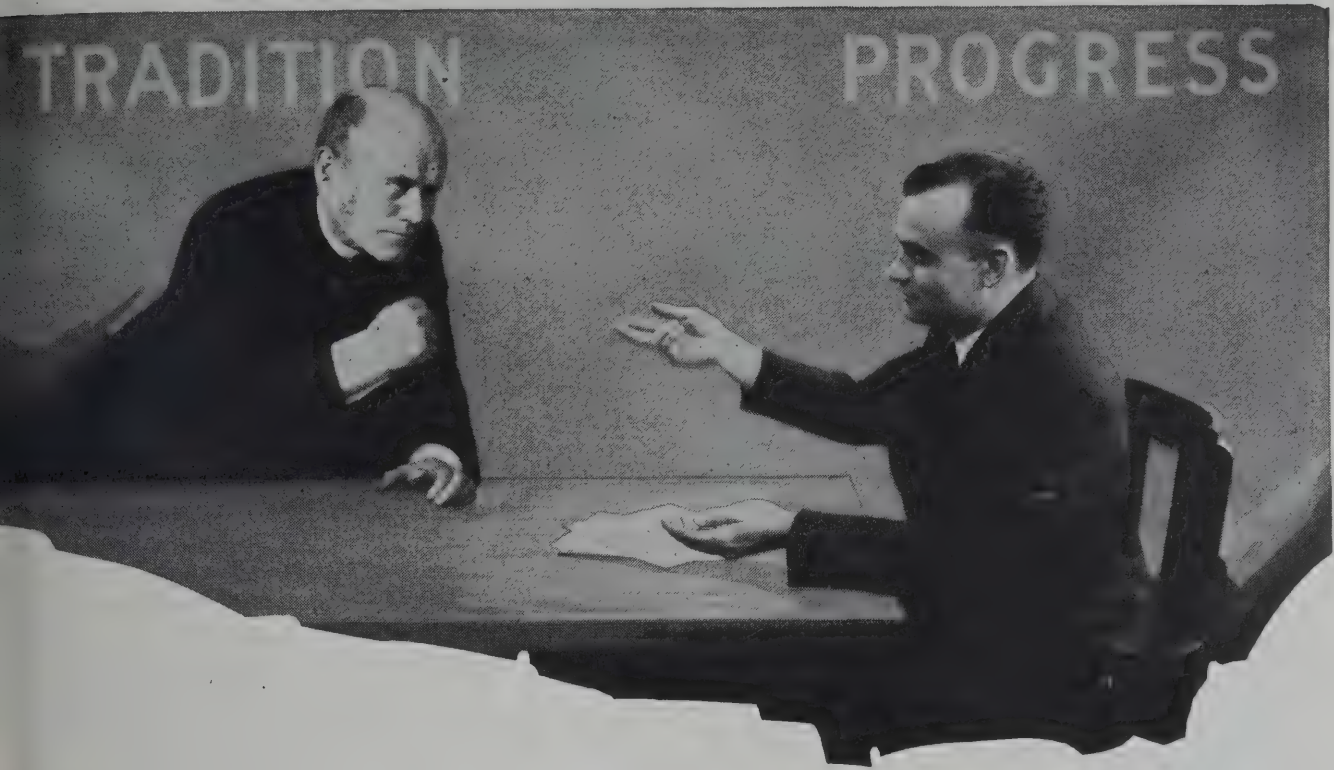
op Cusses and Lad Discusses Insulation



'Lad—

if we had in the bank all the money we
ost in bottle washer shutdowns due to motor
roubles last year, we could endow a primary
lection. Felix tells me it's all due to the
rong kind of insulation."

"No, Pop—

it's all due to the wrong kind of motors.

In all those shutdowns last year, read the names of the motors.

You don't see a Linc-Weld saying HERE to that mussy roll.

Those two Linc-Weld motors I bought over your objections had the hardest jobs in the plant and today their insulation is pliable as your ear lobe.

The Lincoln people have always led the field on insulation."

Read on Page 11 of the Motor book just why no motor can hope to beat Linc-Weld on this item. Your copy is waiting for you at:

The Lincoln Electric Company, Dept. 25-2, Cleveland, Ohio

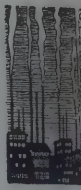
Annual Meeting of the Dairy and Ice Cream Machinery and Supplies Association Featured by Highlights of Interest to Dairymen Everywhere. Jordan Re-elected President.



IN RANGE of facts reported, action taken, comments made and predictions offered or substantiated, the eighth annual meeting of the Dairy and Ice Cream Machinery and Supplies Association, Inc., held in New York City, January 14, provided a series of "high lights" of interest to the dairy products industries.

With a representative attendance of member company executives from territories as diversified as Missouri, New York, Iowa, Illinois, Michigan, Wisconsin, Pennsylvania, Vermont, Ohio, Massachusetts, etc., a morning session was devoted to a consideration of officers and committees' reports and to general discussion of organization matters.

At luncheon an effective address was made by Fred Rasmussen, executive secretary of the National Association of Ice Cream Manufacturers, covering a number of phases of industrial development principles and practices, with particular relation to the dairy industrial field.

In an afternoon session five expiring directorships were filled by the re-election for three year-terms of Messrs. O. S. Jordan, Brown & Shaw; H. H. Miller, H. H. Miller Industries Co.; Thomas D. Cutler, The Ice Cream Trade Journal; H. A. Keiner, Keiner-Williams Stamping Co., and J. H. Mulholland, John H. Mulholland Co.

The board of directors, meeting later in the afternoon, re-elected Mr. Jordan, president; Mr. Miller, vice-president, and Mr. Cutler, treasurer.

Among other action by the association, special temporary financial support of the regular operating activities of the American Dairy Federation was authorized.

Some of the range of pertinent industrial affairs, conditions, trends, etc., to which attention was drawn by the occurrences at the meeting may be summarized:

"It is difficult to believe that the dairy products industries will suffer any recession in the next twelve months," was a statement made by President Jordan. "A great development of current business which makes it possible for executives to forestall the bad effects of sudden changes of conditions is the modern trade association....Our association is more and more becoming of value to our individual businesses through the wealth of information which it collects and disseminates.

"I am informed that trained students of industry report that a new attitude and condition have developed in the last few years. I am told that the chief statistician for a corporation reported to spend more than any other business unit in the world in trade research, has stated that the old habit of the curves which show business expansion and recession, is changing because where, before the w
there was perhaps one man in an industry watching t
curve, today there are thousands watching it. If
curve is seen to be rising too abruptly, these men shif
shorter-term commitments, and the curve straightens
If it is seen to be going down sharply, thousands of c
panies deliberately inaugurate last-ditch economies, p
on as many savings as they can to the buying field
stiffen or expand their sales efforts, and the dropp
line fairly quickly turns upward.

"To many business men charts and intricate figu
are unnecessary. They need only certain common se
related pieces of information which their own obser
tion can obtain for them or which their salesmen
purchasing departments are instructed to obtain. T
carry their charts in their minds. But it is because
many more of them are making these mental charts
studying experts' figures, that trained research men
port the predicting of strong upward or downward mo
ments, for the future is even more difficult than it u
to be. I believe that many of our member compan
many of their customers, and many of the compan
from which our members buy their raw materials, w
carefully on the lookout in 1926 for signs and symb
of approaching changes of conditions, and that th
watchfulness helped greatly to preserve a fairly e
movement of trade."

The "Why" of the Association.

"The fundamental human and business reason
your association," Roberts Everett, secretary-mana
told members, "is that you all sell to a common mar
Without you the dairy products industries would be r
tively puny industries. It is your group which has de
oped the labor-saving, profit-m
ing mechanism and methods wh
have permitted the tremendous
crease in the volume of manu
tured dairy products.

HERE WAS A TEST!!

---AND PFAUDLER PROVED ITS DEPENDABILITY *as usual!*

Note:—Above views were taken immediately after the accident which befell this Tennessee Dairies' Truck Tank Dec. 28, 1926. Photos are unretouched.

ASH OF TENNESSEE DAIRIES' TRUCK TANK FAILS TO HARM TANK OR MILK

[Proving the Fallacy of Using Light-Weight Materials for Dairy Construction]

¶ Tennessee Dairies, Inc., whose slogan is the "The World's Safest Milk", was found to be absolutely safe in Pfaudler equipment, even under adverse operating conditions. The photos above depict the plight of one of their truck tanks which tried to play leap frog.

¶ In spite of this prank, Mr. K. V. Lipscomb, Vice-Pres., states that the tank, while full of milk at the time of the accident, was unharmed and not a single drop lost.

¶ Lying exposed for thirty hours in a climate averaging 70°, the truck was finally righted and brought to Dallas, Tex., where the milk on being emptied was found to have risen less than 4° in temperature.

¶ In many similar occurrences Pfaudler Truck Tanks have withstood such shocks without the slightest damage. This clearly illustrates the fallacy of using material of lighter construction to gain a partial benefit in total weight.

¶ For dependable equipment write The Pfaudler Co.

E PFAUDLER COMPANY *Dairy Division* ROCHESTER, N. Y.

PFAUDLER

ufacturers of the country so that, selfish in your object, the pursuit of your ends, unselfishly benefits your buying field."

1927 Dairy Industries Exposition as a Buying Mart.

"The 1927 exposition promises opportunity of success equalling 1926...The belief appears strong throughout the dairy products field that the expositions should be made much more important buying events than in the past, that within a few years they can and will become annual buying marts. There is no valid argument against the association's stressing the value of future expositions as buying centers, plainly of inviting dairy products manufacturers to do a share of their buying at the shows and to round out annual buying schedules there. There are sound economic considerations which would make such a course of benefit both to the machinery and supplies houses and their customers," it was stated in a discussion of current and prospective activities by the association.

Bureau of Service and Statistics.

"Its job is to analyze and interpret the actual size and nature of, and practices and trends within, the ice cream industry, which is one section of your common market. This bureau in the last year has discovered things—homely and suspected truths some of them, some of them startling and thought-changing—about the ice cream industry that no one knew before. This bureau's work helps you because it tells you things about a part of your market that help you know how to prepare goods for and sell them to that market. It helps one section of your customers—the ice cream manufacturers—because it tells them, also, essential truths about their businesses and, making them more intelligent as buyers is, in the long run, once more benefiting you"....was an official summary given of the function of the ice cream industry's bureau of service and statistics, jointly maintained with the National Association of Ice Cream Manufacturers.

Association Membership.

A membership of 170 companies, making every physical and special service requirement of dairy products manufacturing businesses and thus, in the opinion of its officers, establishing the association as one of the strongest selling-interest national trade bodies in the country, was reported.

Salesmen's Club.

Activities of the salesmen's club of the association were reviewed and a membership of 980 sales representatives of machinery and supplies houses, travelling throughout every county of the United States and Canada, reported. The success of the club was reviewed, in its purposes "to make the salesman a better informed representative, to make him think in termss of an industry without forgetting his own company-thoughts and his own job-thoughts."

"The club tries to better the relations between salesmen and the buyer." It was stressed Honesty in Sales.

"The association can and does," Mr. Everett reported, "to the utmost that any voluntary association can expect to do, encourage honest sales practices and discourage and stamp out unfair business methods. No one can deny that the enunciation of the association's Fair Practices Code, to which every member of the association must subscribe, has improved business practices in this field. That improvement helps your customers save their money."

Manufacturers' Query and Answer.

The association as an information center in manufacturing dairy industrial matters was pictured in various reports presented.

"Queries from dairy products manufacturers, as as from member association houses, receive attenti they relate in any reasonably direct way to the fie dairy products manufacturing. These requests through personal callers, by letters, telegrams, local long distance telephone. Rarely a working day p without the association's office receiving, and atten to such an information query. Many buyers are dir to sources for equipment and materials in this Many inquiries concerning processes and their app tion are either answered directly, or routed to tech specialists for attention," is the summary made by report.

A Buyer's Guide.

The issuance by the association within the near fu of a comprehensive dairy industries buyers' guide forecast. "It will be in the form of an association log, listing all the requisites of dairy products man tories with manufacturers and distributors of each will be sent to all dairy products plants of record i United States and Canada and other continents," it stated.

COMMITTEES NAMED.

O. S. Jordan, president of the Dairy and Ice C Machinery and Supplies Association, has announce appointment of the following committees of that o ization:

Executive Committee of Board of Directors: Jordan, Brown & Shaw; H. H. Miller, The H. H. M Industries Co.; Thomas D. Cutler, The Ice Cream T Journal; H. A. Keiner, Keiner-Williams Stamping and J. H. Mulholland, John H. Mulholland Co.

Membership Committee: H. A. Keiner, Keiner liams Stamping Co.; B. B. Scott; W. L. Cherry, Cherry Co.; J. L. Nelson, C. Nelson Manufacturing and Loomis Burrell, D. H. Burrell & Co., Inc.

Exposition Committee: K. W. Schantz, K. W. Sch Inc.; L. B. Esmond, Essex Gelatine Co.; Albert Mc gal, The Champion Line Machinery Co.; J. W. Hu Davis Cooperage Co., and Warren J. Smith, Crea Package Manufacturing Co.

Finance Committee: O. S. Jordan, Brown & S H. A. Keiner, Keiner-Williams Stamping Co.; H. H. ler, The H. H. Miller Industries Co.

GREENE COUNTY, TENN., TO HAVE NEW MI CONDENSERY.

T. D. Bradson, president chamber of comm Greenville, Tenn., made the following announcemen garding the establishment of a milk condenser Greene county, Tenn.:

"We are making a survey of the county for the pose of securing pledges from farmers for 5,000 necessary for the minimum requirements of a milk densery for this city. The Van Camp Milks Pro Corporation of Indianapolis has a fieldman in the co and it is thought that a definite decision will be this month. The corporation expects to build a costing around $250,000, and believes that the req amount of milk will be 50,000 pounds a day. The co is ideally adapted to the dairying industry; it is the largest in the state, unusually well watered, with fe valleys and upland fields suited for pasture conditio

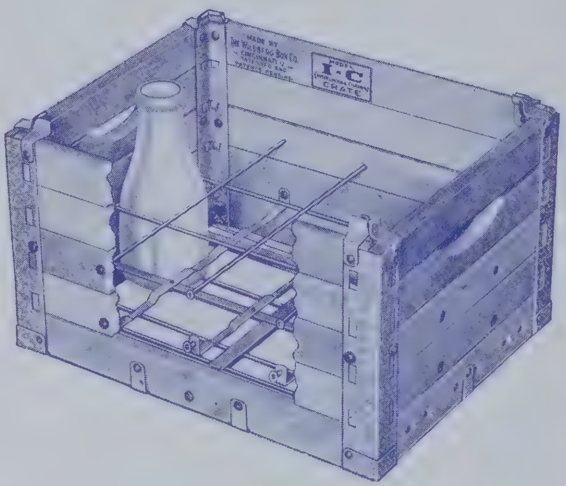
7 Reasons Why You Will Eventually Buy

The MODEL I-C (Interlocking Corner) CRATE



MADE BY THE WILDBERG BOX CO.
CINCINNATI O.
MODEL I-C CRATE

*NO NAILS.
NO SCREWS.
NO LACING WIRES.*

Consider These Points of Superiority

1. Great strength in construction and Flexibility of Frame to insure long wear.
2. Rigid interior Safety grid to give your bottles greater protection than any other crate on the market, with no sacrifice of ease in handling bottles.
3. Ease of Repair, which, due to the simplicity of our construction can be done in one-fourth the time needed for any other reinforced crate.
4. Lighter in weight by three to five pounds, yet stronger than any other crate.
5. Runners that reinforce the Bottom Slats on Bottom, and inside and outside—another exclusive patented feature.
6. Standard in size inside and outside—will stack with your crates and fit your wagons and conveyors.
7. Materials and Workmanship the best obtainable.

HECKING RECORDING THERMOMETERS.

emperature control is an essential feature in regard iform results and safety of the product in all dairy s. This is especially true in the case of pasteuriza- of milk for its consumption in the natural fluid Five years ago a survey of bureau of dairy con- showed that 80 per cent of the recording themom- used in dairy manufacturing plants throughout the of California were inaccurate or not in working ition. Today it is rather exceptional to find a ding thermometer out of use and the number of in- ate instruments have been greatly reduced. How- these inaccuracies occur with sufficient frequencies nphasize the necessity of checking the instruments equent intervals, at least every two weeks. We are in receipt of a report on the checking of recording nometers conducted by one of the California ap- ed milk inspecting departments. The results of king the thermometers in the milk plants were ted over a period of three months and we believe esults of this check will be of interest to all engaged ilk control work.

Aug. 7	Aug. 21	Sept. 11	Sept. 18	Oct. 9	Oct. 23	Nov. 11
OK	OK	OK	OK	OK	OK	2 deg.—
OK	2 deg.—	OK	OK	OK	OK	OK
OK	OK	4 deg.—	OK	OK	2 deg.+	4 deg.+
7 deg.+	OK	6 deg.—	OK	4 deg.+	sold out	
5 deg.—	14 deg.+	OK	9 deg.—	25 deg.—	25 deg.+ thermometer condemned	OK

n October 25 the instrument showing the 25 degree ation was condemned and a new instrument installed. as interesting to note that during the period the in- rate instrument was used the bacterial counts were irregular, ranging from 1,000 to 150,000. Since installation of the new thermometer the bacteria ts have been kept constantly under control.

Vith the thermometer spud located in the bottom of pasteurizing vat, it is possible to start bottling as as the milk has been raised to the required tem- ture without affecting the chart since the holding erature will be recorded as long as there is enough in the vat to cover the spud, the bottling process iring about 30 minutes for completion. Several gestions have been made for eliminating the possi- y of such a practice, none of which are considered e effective. It is recommended that in any instance re the above practice is suspected, that the plant be ed at the time the pasteurizing temperature has been ed to the holding point, and that the inspector leave return at the end of 30 minutes and if the plant is d to have been bottling the milk in the meantime they be prosecuted.

There are two types of inaccuracies of recording ther- eters. Where a correct reading is obtained at one perature but is incorrect at another temperature, the rument is out of calibration and must be sent to the ory for re-calibration. On the other hand, an in- ment which is uniformly off at all temperatures is of adjustment and can be corrected by means of the sting screw.—From a News Letter Issued by the eau of Control, California Department of Agricul-

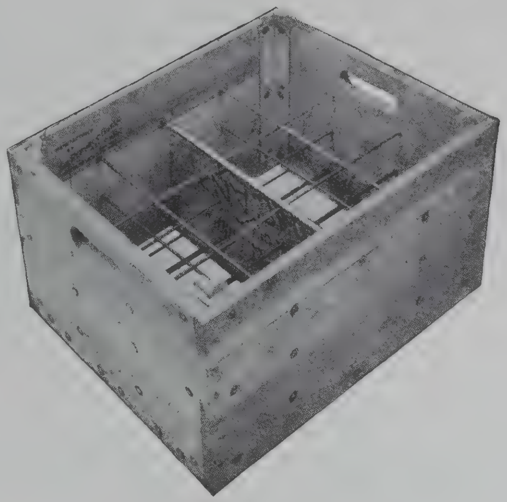
⁂

ANOTHER FINE PLANT FOR CHICAGO.

Construction is moving along nicely on the new plant the Louis Rosen Dairy Co. at 1336-42 South Peoria Chicago, Ill. The plant is expected to be ready for upancy by March or April of this year.

The structure will be two and a half stories high and said will be one of the most efficient plants of the l in the city. The exterior is to be of terra cotta, le the interior will be finished in tile.

The Highest Grade of Galvanized Metal



is used in

REPUBLIC
Bottle Crates

"As Strong as the Republic"

ONE of the most important parts of a bottle crate is the galvanized metal. Not all galvanized iron is alike. In Republic Bottle Crates you get the highest grade of galvanized metal obtainable—called "Toncan." This metal costs about one-third more per pound than ordinary grades generally used in making crates. But "Toncan" lasts longer, has greater rust-resisting properties and gives additional strength to the case.

This is but one example of the quality behind Republic Crates. Before you buy, get complete information and prices. You will save money on Republics.

Standardization of Milk Plant Equipmen

Report of Committee on Standardization, as Presented to the Detroit Convention of the International Association of Milk Dealers

By W. H. FORSTER*

AT LAST year's convention in Indianapolis, the Plant Section passed a resolution recommending that a committee be appointed for the purpose of studying dairy machinery and equipment from the standpoint of sanitary construction. Your executive committee aproved of this, and asked the standardization committee to undertake this work.

Your committee, believing that we would get at the defects in dairy machinery more effectively from the experience of our members, instructed the secretary to send out a questionnaire to our membership, asking the members to first list the equipment that each member had found faulty in sanitary construction of mechanical operation. Second, to list the faults with this equipment. Third, give the name of the manufacturer of the equipment. This questionnaire brought 42 replies with various complaints. These replies were tabulated, as to the manufacturer of the equipment, the kind of equipment, and the complaints regarding this equipment. These replies to the questionnaire were taken up in detail by your committee at a meeting held in New York on July 14th.

It was found that some of the complaints were either unjustified, or were the result of old equipment, the defects in which have been remedied in later models of equipment, brought out by the same manufacturer.

After we had reviewed all of the reports of members, regarding defective or unsanitary machinery, our secretary wrote to each member who had answered the questionnaire, advising him of our findings. We have also written to the manufacturers of the machinery, drawing their attention to justifiable complaints that were reported on, by our membership, thus affording the manufacturer an opportunity to correct the trouble which any member was having with this particular machine, and thereby rendering our members a service in this respect. Your committee made arrangements to meet with the engineers of the various manufacturers on the floor of the Exhibition Hall on Tuesday, October 5th, the day preceding our convention, to discuss with them defects in machinery noted by our membership, which we hope they can remedy. The manufacturers have written many letters of appreciation of this movement, and are willing to work wholeheartedly with us for the sanitary and mechanical perfection of dairy machinery.

The standardization committee visited the machinery exhibition and went over the various types of machines of which there had been complaints, either regarding sanitary or mechanical conditions.

These various complaints were discussed with the engineers of the various firms and explanations were given by the engineers showing in some cases that they considered the complaints unwarranted but in the majority of cases complaints on older machines had been overcome and corrected in the newer models.

Other complaints that were warranted, the various firms appreciated, having us go over the equipment with them and will do everything within their power to correct the defects complained of.

Standardization of Sanitary Thermometer Connections:

At last year's convention we reported the standardization of a sanitary thermometer spud for coil vats. This standardization has been accomplished and a set of
master gauges is on file in the office of the secretar
case any member wishes to check up this standard
mometer spud.

We were not able to report at the last meetin
the standardization of a spud for glass lined tanks.
matter had to be further followed up, due to the
that two manufacturers did not see eye to eye wit
committee and the other manufacturers. A meetin
your committee and the thermometer manufacturer
held in New York on July 15th, to endeavor to co
a final decision on this spud, with this result, that
the thermometer manufacturers have now approv
the specifications for the spud for glass lined tank
last approval having come in under date of Octobe
from a district manager, and has yet to be confirm
the officers of the company, which will be forthco
in a few days.

We will have to amend that report to show now
per cent of the manufacturers of glass lined tanks.

Bottle Standardization.

You will remember that your committee has
working with the bottle manufacturers and the De
ment of Commerce, in an endeavor to eliminate
ous heights of bottles and cap seats. At the time o
year's meeting, we had practically reduced the he
of bottles from 12 to 3 heights on each size, quarts,
and half-pints, and probably 90 per cent of the cap
are now No. 2.

It was felt, however, that a further effort shou
made on the part of the committee and the bottle
ufacturers in co-operation with the Department of
merce, toward a further elimination of different he
of bottle. For the purpose of considering and stu
this matter, a meeting was held in New York Ci
September 8th, at which we met the bottle manuf
ers and Mr. Colwell, representing Secretary Hoov
the Department of Commerce. At this meeting i
decided to recommend to you, that quarts should h
minimum height of 9¼ inches and a maximum o
inches, the manufacturers reporting that 90 per ce
the quart bottles now manufactured are of these
heights. That pints should be standardized a
inches, the manufacturers reporting that 75 per ce
the present production is of this one height, and
half-pints should be standardized at a height o
inches, the manufacturers reporting that outside o
tain special large size orders, 80 per cent of the p
orders are of this height. As regards the half-pin
manufacturers are giving special study to the pra
bility of this height, and with a view to manufact
a bottle which will not tip so easily on the bottlin
chines, and will work satisfactorily in the present
matic washing machines. The committee espe
draws your attention to this proposed revised dime
of the half-pint bottle, so that you can check up
equipment, and especially the bottle crates holdi
bottles for half-pints, and see if the dimensions o
new half-pint bottle will work satisfactorily in
crates. We sent each member a blue print of thi
type bottle through the mail, asking you to chec
dimensions of the blue print with your present ha
bottle, and come prepared to discuss at this tim
advisability of making this new design standard.

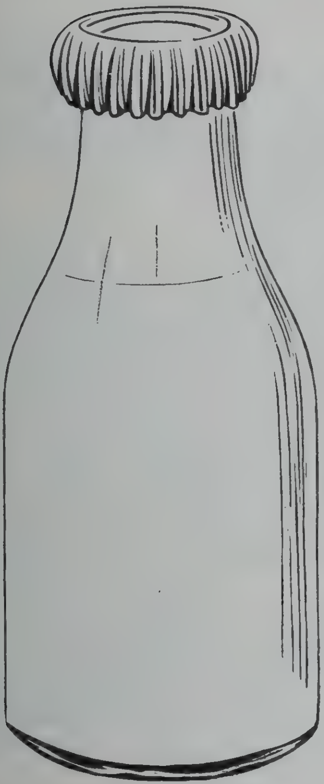
The Perfect One-Piece Seal



THE PERFECT one-piece, non-resealable sanitary seal is here. No wires or other equipment of any kind are required to hold it in place, yet it is airtight and water-proof.

¶ It cannot be knocked off or jarred loose in handling, but by a simple turning and lifting movement may easily be removed by hand. Once removed, it can be used as a dust cover for the bottle, but cannot be tightened and used as a seal again.

¶ The five-ply spruce paper discs are softened in the automatic bottle sealing machine, and moulded to shape while soft over the tops to the under side of the lips of the bottles. The moulding fingers of the machine hold them in place while they cool and set. That's all there is to it!

¶ The Westlake Seal is the most completely protective milk bottle seal ever devised, the easiest to apply and the simplest to remove.

When writing to AMERICAN MACHINE & FOUNDRY CO. *please mention The Milk Dealer.*

hope you have done this before coming to this meeting and are now prepared to discuss it and take action.

I might just explain that there is only a difference of one-eighth of an inch difference between the half-pint bottles of 5⅜ and 5½. It was thought probably the best to try the 5⅜, as being medium, but inasmuch as there is only one-eighth of an inch difference between them and the 5¼, the manufacturers felt that they could make a more satisfactory bottle, a bottle which would not tip so easily, and a bottle which would have a broader base. They could shorten the curvature, a little wider, so that it would have a wider base and a little more acute circle at the corner. So far as the neck of the bottle was concerned the question was asked me today this, in putting out milk in half-pint bottles will this not reduce our cream line? An eighth of an inch reduction at the top of the bottle would not be a sixteenth of an inch difference in the depth of your cream line. I do not think that that is a factor that should worry you in the least, because you get a more satisfactory working bottle, a bottle on which you are going to save money, stops breakage of bottles. The committee felt, after considering the matter very carefully that it was the best height of bottle to recommend, providing you can work it in your cases, that is the only question.

Your committee likewise discussed the advisability of taking action on what we call freak or radical style of bottles. As the members will recall, this matter was considered at some length at last year's convention, at which time the milk bottle manufacturers proposed this program, "THAT THEY WOULD NOT MANUFACTURE ANY FREAK OR RADICAL STYLE OF BOTTLE WHICH MIGHT BE PRESENTED BY A DESIGNER OR PATENTEE UNTIL THE MATTER WAS FIRST REFERRED TO OUR STANDARDIZATION COMMITTEE," or until a program might be worked out as between our respective groups and the Department of Commerce at Washington.

As a result of our deliberations the following resolution was introduced by Mr. Colwell, representing Secretary Hoover of the Department of Commerce, which was unanimously adopted:

> "Furthermore recognizing the efforts that have been made by Secretary Hoover of the United States Department of Commerce, the manufacturers of milk bottles, and the International Association of Milk Dealers to benefit through a joint program looking towards the standardization of the milk bottle and further recognizing the fact that there is constantly being devised and placed upon the market numerous types, shapes or finishes of bottles and further recognizing that the constant adding of these additional types and shapes of bottles will not only tend to delay, if not, in fact, prevent a program of standardization and simplification of bottles, but that each new type and shape so adds to the increased cost of marketing of all milk bottles without tending to increase the efficiency of the industry.
>
> Be it resolved that the joint conference ask the Department of Commerce to add to Simplified Practice Recommendation No. 10 a recommendation that before agreeing to make any new type or shape of milk bottle, the milk bottle manufacturers through its committee appointed for the purpose shall first refer the matter to a joint conference of committees of the milk bottle manufacturers, the International Association of Milk Dealers and the Department of Commerce, with a view of determining, after the patentee or designer has been afforded an opportunity for a hearing, whether the addition of such type or shape will be in the interest of progress of the industry. If it is the opinion of the joint conference that such additional type or shape is in the interest of such eco
> progress, then such additional type or shape m
> included in the Department of Commerce, Simp
> Practice Recommendation, after which the milk
> manufacturers shall feel free to fabricate such
> type or shape of bottle but not otherwise."

Mr. Colwell, representing Secretary Hoover, sai
he would take these minutes and resolution back
Department of Commerce and refer the resoluti
their Solicitor General with a view toward determ
whether or not the said resolution was in strict
formity with legal requirements. If so, they would
revise the Simplification Recommendation No. 10,
you will recall was the first serious effort made
attempt to secure actual elimination of waste in the
ufacture of milk bottles. If this is accomplished
recommendation will come to you in the very ne
ture through the Executive Secretary's office.

During the discussion at our meeting in New
the milk bottle manufacturers made a statement
they were entering upon a program through the
Container Association for their industry, looking t
the adoption of a uniform cost system in their bus
Your committee feels that if they do this, that the
then apportion the proper cost to the present com
sense bottle, and the proper cost to the off-sta
bottles, for we feel sure that the off-standard bottl
not now bearing the proper share of costs, and t
prices were set in proportion to cost, the off-sta
bottle would be priced much higher than the com
sense bottle. We therefore feel that the standardi
of milk bottles should eventually reflect itself i
price of common-sense milk bottles as compared
off-standard bottles.

SEEKS TO REGULATE IMPORTS.

In speaking to the Senate, in behalf of Hous
No. 11768 to regulate the importation of milk and
into the United States, Senator Gillette of Massach
said in part as follows:

"The purpose of the bill, as we all know, is m
to insure the purity of milk which is imported from
ada. We have found in this country that the best m
of safeguarding the milk supply from the standpo
sanitation is by an inspection of the herds and
dairies; and this bill provides indirectly such insp
shall be made in Canada.

"The bill provides that milk shall not be imp
unless the U. S. Department of Agriculture is as
that it has been subjected to substantially the sa
spection as that to which the producers of mil
farmers and the dairymen of this country, are o
to submit.

"It is objected that the bill if passed would be
fringement of state rights. Here is a case whe
state cannot possibly secure the end at which w
No one state can compel milk inspection in Canada
ports are peculiarly and exclusively within the ju
tion of the federal government. That is what th
covers.

"If it were possible, I would rather that all th
consumed in New England should be produced
United States. Of course, that is impossible beca
distances. So, much as we would prefer to be f
our own countrymen, we are compelled by propi
to use the milk and the cream of Canada."

PROSPERITY

It is almost impossible to estimate the vast improvements which the last ten years have brought about in the production of milk and milk foods.

As a result quality milk foods are being produced, greater consumption is being encouraged, and bigger profits accumulated to the producer.

So significant is the contribution of sanitary cleanliness to these results that increasing numbers of dairymen are specifying

Wyandotte
Dairyman's
Cleaner and Cleanser

as the standard material for all their dairy cleaning.

This pure, inorganic, greaseless cleaner has stood the test of twenty years unfailing sanitary service to the dairy industry.

These years have been marked by the greatest prosperity, a prosperity in which Wyandotte Dairyman's Cleaner and Cleanser has contributed a valued part.

Ohio Holds Banner Meeting

One of the Largest State Conventions Held in Great Industrial City Proves of Extensive Benefit to Hundreds Attending

WHEN Mayor Murray Seasongood and W. C. Culkins, executive vice-president of the Chamber of Commerce, extended greetings of welcome to the delegates to the Ohio Dairy Products Association Convention, which opened Tuesday morning, January 25, at the Hotel Gibson, Cincinnati, they addressed one of the largest crowds in history attending a state dairy meeting—the number reaching close to 500 attendants. Ohio proved to be full of enthusiastic dairy boosters; men in the dairy industries who are anxious to get together with their competitors, call them their friends, and exchange ideas and plans with each other for the general good of the industry in which they are all vitally interested.

The Ohio Dairy Products Association is comprised of The Ohio Milk Distributors Association, The Ohio Association of Ice Cream Manufacturers and the Ohio Association of Creamery Owners and Managers. These associations held joint meetings following the general meeting, the former extending on through the following day.

At the opening meeting H. R. O'Brien, secretary, Ohio Corn Borer Control Committee, ably handled a subject of interest of the "Corn Borer Menace in Ohio." He stated that the European corn borer is the greatest menace to America's corn crop, and surmounts in its devastation any of the other denizens of the insect world. "Ohio is in more danger from the ravages of the borer than any other state. Congress has been asked to appropriate $2,000,000 for a national campaign against the borer," Mr. O'Brien stated, and that "the Ohio Legislature will be requested to appropriate $200,000 for a fight against the bug in the Buckeye state alone." He further stated that if the ravages of this pest go unchecked, the corn crop of Ohio will be destroyed and the result will be that the farmers will charge more for their milk and the distributors will have to make the consumers pay increased prices.

Carl Schaufele, director of the Ohio State Restaurant Association and president of the Columbus Restaurant Association, explained "Why Restaurants Serve Milk, Butter and Ice Cream."

A. Elliott Kimberly, sanitary engineer retained by the committee, spoke on "Progress of Work in Disposal of Dairy Plant Wastes." He gave an account of the means employed to avoid stream pollution.

J. H. Schindler, Cleveland, chairman, read the "Report of Committee on Dairy Plant Waste Disposal."

Milk to Prevent Disease.

At 12:00 o'clock the Dairy Products Association luncheon satisfied the "inner man" of a splendid number of attendants.

J. O. Winters, president, Greenville, O., presided.

Dr. Carey P. McCord, of the Industrial Health Conservancy Laboratories, University of Cincinnati faculty member, discussed "Milk for the Industrial Worker." He told of his investigation of milk as a preventive of certain occupational diseases. He further stated that investigations had shown that the drinking of a quart of milk a day by workers in factories where lead poisoning had been prevalent will reduce that danger very materially. Dr. McCord cited other occupational diseases which can be combatted by the simple process of having workers drink milk.

Miss Aubyn Chinn, Chicago, of the National Dairy Council, rendered "M'Dear, You're a Jewel!" She tribute to the cow as an asset to American life. She of the value obtained from wholesome exercise, air, restful sleep and proper food, which, she expla "included all dairy products."

The Secretary Speaks.

E. B. Krieger in giving an account of Mr. W worth's address, states: Oh, you beautiful lady! they left you at home! A dairy convention withc cow! "But here am I," spoke up W. Allerton W worth, tall, dark, smooth-shaven and sofe-spoken ecutive secretary to all the cows in Ohio and som Indiana and Kentucky. "The cows had to stay hon keep house so they sent me to speak for them. It unusual situation," he added. "Without the cow the farms we couldn't have a convention here; and the cows here we wouldn't have anything but the to talk about."

So really the cows did the best thing when they mitted Mr. Wentworth of Columbus to represent at the annual convention of the Ohio Dairy Proc Association. As executive secretary of the associa Mr. Wentworth knows lots about cows and their lems. He knows their records, too—how much milk gave in 1926 and every year before that since rec were kept; and how much of that milk went into bu how much into ice cream and how much went as a b age into the homes.

And what a death blow he dealt to that old wh about milk being all water!

"Milk is about 87 per cent water—the solver which the valuable life-giving products are held, said. "But what about your other foods? Do you k that beefsteak is 60 per cent water; potatoes 82 per water; eggs 85 per cent water and cabbage 90 per water?"

That isn't all, either. If we were as scientific a sometimes pretend to be we could sit down with a of milk and a dish of spinach and call it a meal.

The milk contains butterfat, milk-sugar, lime, ca and albumin—all dissolved or suspended in water. only other ingredient really needed for a meal is mineral content, obtained from spinach. If you baby-talk, you don't need the spinach. Only adult quire iron.

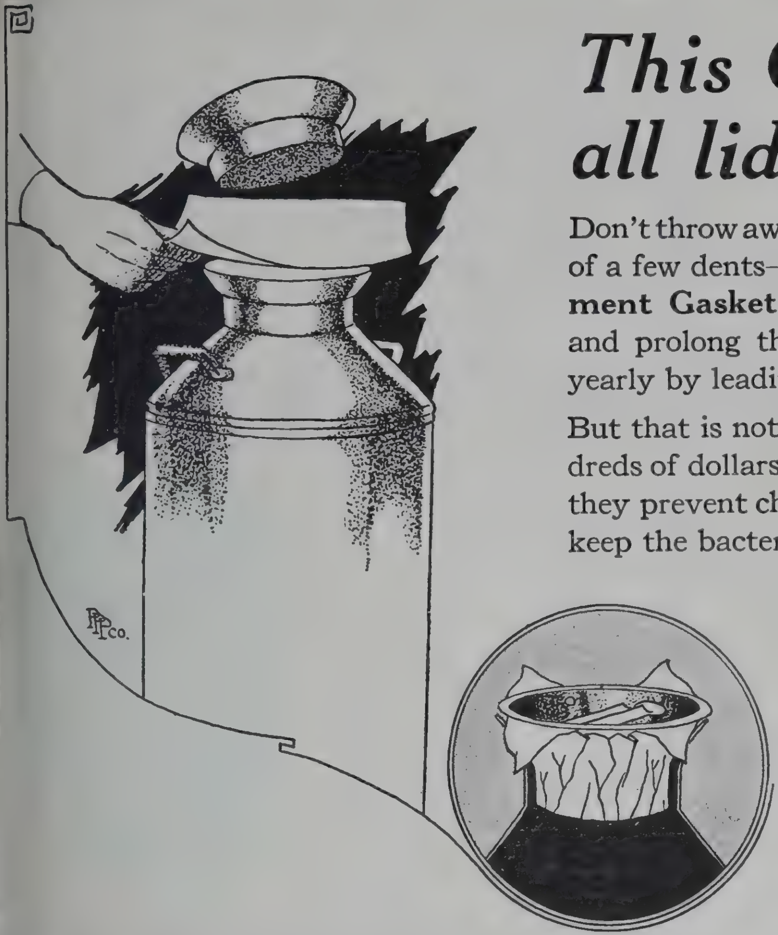
Millions for Dairy Products.

We Ohioans last year spent $140,000,000 for mil drink. Another $65,000,000 was spent by us for crear butter and $40,000,000 more for ice cream.

We're working our cows to the limit in order to that supply of dairy products. The number of cow Ohio has increased only one per cent during the last years. Yet the number of gallons of milk produce the state has increased nearly 25 per cent. The answ that the cows of Ohio have been educated to give average of 550 gallons of milk in 1926, as compare an average of 450 gallons in 1921.

"How was that done—are you growing bi cows?" the question seemed fair enough.

"Not at all," Executive Secretary Wentworth plied. "The cows have not changed in size. It's the creased attention they have received from the farm The farmers have been getting proportionately more milk than for some other farm products and, consequ



This Gasket makes all lids fit like new!

Don't throw away perfectly good cans or lids because of a few dents—use **Paterson Vegetable Parchment Gaskets.** They make all lids fit like new and prolong the life of every can. Millions used yearly by leading milk shippers.

But that is not all! Parchment Gaskets save hundreds of dollars worth of "spilled milk and cream"; they prevent churning of cream in the lid and help keep the bacterial count where it belongs.

Parchment Gaskets are easy to use. They come cut to size in packages of 1000. **Soak them thoroughly in clean water,** place over neck of the can and jam down the metal cover.

Parker Standard Milk Box Co.
228 WARREN AVE. :: SAGINAW, MICH.

ly, have been paying greater attention to their c The Ohio State University Extension department rendered valuable service to the farmers in sho them what attention the cows are most likely to rec cate by giving more milk. Indirectly, good roads helped too. They have aided the farmers to marke milk more readily—and that is an incentive for farmers to give greater attention to their cows and increase the milk supply."

"It might be thought we might have reached saturation point" for milk. But the automobile m facturers thought that, too, until they just kept o creasing their output and found the "saturation po was a theory and not a fact.

We imagined we were great milk consumers in when the per capita consumption of milk in Ohio wa gallons a year. Now it is 60 gallons a year—the gre per capita increase in any food."

And ice cream! One would think we people lived on ice cream to hear Executive Secretary W worth quote figures showing how we like it. As a w the United States uses 4 per cent of all the milk su to make ice cream. In Ohio 12 per cent of all the consumed in the state is used in the manufacture o cream. The consumption of this food product has than doubled in ten years. In Cincinnati alone last 3,500,000 gallons were produced.

Ohio Eats Butter.

And butter—creamery butter! Five years ago 3, 000 more pounds of butter were made in Ohio than consumed in the state. Last year Ohio consumed 000,000 pounds more than they made, sending to o states for the difference. The Cincinnati productio butter last year was 12,000,000 pounds—the greate any city in Ohio—and Ohio consumed all that an 000,000 pounds more. So if they are eating butte the rate of twenty pounds a year per person, they're up to the 1926 quota.

At 4:15 p. m. all meetings adjourned to the ball of the roof garden of the hotel to witness a clever health lesson production put on under the auspices o Ohio Valley Dairy Council. The children of the oming Public School staged a "Health Circus." It a good lesson for those present to see that their chil get the right food, exercise and fresh air. The im tance of dairy products played an important part.

Miss Ada L. Lockhart gave an interesting rend of "The American Girl Beauty Products." A table taining carrots, spinach, milk, water, butter, etc., he to illustrate her talk upon how the American girl get to perfect beauty attainment.

Joint Banquet.

At 7:00 p. m. in the Hotel Sinton the association quet was held. The room was crowded to capacity. entertainment was first class; dancing followed.

At 8:30 p. m. on Wednesday, a smoker was give Heidelburg, across the river in Cincinnati, by the cinnati Dairy Products Industry who acted as hosts

Following the two-day meeting in Cincinnati, th tending Kentucky delegates, and many other deleg from Ohio and other states accompanying t journeyed on to Lexington, Ky., where a luncheon m ing of the Dairy Products Association of Kentucky held at the Phoenix Hotel. This meeting numb about 60 attendants. Account will be given elsew of this gathering.

Many ladies attended the Ohio Dairy Products A ciation convention and a very pleasant time they being taken care of entirely by a committee of ladie Cincinnati.

On Tuesday morning they enjoyed a sight-seeing through the Rookwood Pottery plant and other place

interest, stopping at the Alms Hotel for luncheon.

At 7:00 p. m., Tuesday, they were entertained at the banquet and dance.

On Wednesday afternoon, they were treated to the very fine performance of "Craig's Wife" with Crystal Herne starring, at the Grand Opera House.

At 2:00 p. m. the Ohio Milk Distributors' Association 11th annual convention was called to order. J. N. Gibson, president, of Dayton, presided.

The report of officers and committees were given.

The "Ohio Better Milk Council" was given by Dr. R. G. Patterson, executive secretary, Ohio Public Health Association, Columbus, O. Some good work has been done by this council since the last Ohio meeting in Columbus in 1926, and rapid strides are being made toward the production of better milk in Ohio as a result of this council's good work.

The different sectional meetings of the Ohio milk distributors were held during the entire second day, and various subjects were discussed and many special speeches rendered.

Chairman E. J. Helbig, Canton, and Secretary Irving O. Koch, Columbus, took charge of a meeting for milk distributors in a conference on milk plant management.

"Cream Plug—Cause and Remedy," was given by H. E. Otting, Moores & Ross, Columbus.

"Creating Savings in the Plant, and Shrinkage from Receiving Vat to Final Package," was handled by Prof. R. C. Fisher of French Fros.-Bauer of Cincinnati.

F. J. Andre of the Akron Pure Milk Co., Akron, spoke on "Pasteurization."

"Effective Methods of Sterilizing Equipment and Plant Machinery, Sanitary Piping, Etc.," was conducted by H. D. Drain, Dairy Department Ohio State University, Columbus.

In another meeting at 9:30, presided over by Chairman W. D. Hunnicutt, Cincinnati, and Secretary F. M. Campbell, Salem, "Milk Production" conference was held.

F. J. Capouch, production manager of Bowman Dairy Co., Chicago, gave a "Report on International Milk Dealers Association Committee on Better Milk Supply."

"What Production Managers of Our Milk Companies of the State Can Do to Assist the Tuberculosis Eradication Campaign" was handled in a very interesting manner and illustrated with charts showing in what counties tubercular cattle showed up heaviest, and in what counties work had been done so far.

"There are eight areas in the state of Ohio that are free of tubercular cattle, and these areas are the centers of large milk supplies," Dr. Zimmer of the Ohio Department of Agriculture, Columbus, told the members of the association.

"Ohio is comparatively free of tuberculosis among milk cattle. The state within the last two years has spent $750,000 in paying for cattle which it had ordered killed because of symptoms of tuberculosis. The United States government has expended $800,000 in Ohio for this purpose. Most of the work of inspecting dairy herds has been with milk herds and not with beef cattle. The department is interested in increasing the economical conditions of the farms and in creating better milk conditions."

At a third meeting at 9:30 a. m., presided over by Chairman E. E. Foreman, Columbus, and Secretary Corwin L. Knowles, Portsmouth, a milk sales conference was held.

Milk in Industrial Plants.

"Stimulating the Sale of Milk in Industrial Plants," was handled by M. O. Maughan, National Dairy Co Chicago.

"Is papa grouchy when he gets home at night? he lie down and sleep after supper? Does he say, 'P go away and leave me alone?' when mamma wants automobile riding or to the picture show? That's a he isn't drinking enough milk," Mr. Maughan stat

"If a man will drink more milk he will become ter husband. It really isn't because he is lazy. It cause he is worn out when he gets home from work. way to keep him from arriving home worn out is t that he drinks milk is the middle of the forenoon again in the middle of the afternoon, while he work."

Mr. Maughan told of investigations made by national milk council to determine to what extent was being served in the larger factories of the cou In addition a questionnaire was sent to factory mana to learn their observance as to the results of that sys

"I may say that I practice what I preach about drinking—at least, I did this morning," Mr. Mau said. "The high water caused me to get in from Chi so late this morning that I had time only for a gla milk for breakfast. I might add that Mussolini say drinks only a glass of milk for breakfast every day, the captain of the navy football team drinks six gla of milk a day."

Among factories where morning and afternoon cesses are taken from work so the employees may and drink milk, the speaker mentioned a Milwa concern which permits representatives of two milk cerns to enter the factory at mid-forenoon and mid-a noon and sell milk to the employees. Of the 6,000 ployees an average of 2,000 a day buy one or more of milk daily. A St. Louis, Mo., plant has "tea wag for the distribution of milk through the plant. A tiac, Mich., plant sends fruit and milk wagons thro At an automobile factory in Highland Park a fift minute recess for lunch morning and afternoon res in the sale of 50,000 pints of milk daily in the plant al

"This permitting of the sale of milk to the emplo is of great benefit to them, because so many of then to work without much breakfast—you know you how great is the temptation to lie in bed until the minute," Mr. Maughan said. "As a result of the centrated nourishment contained in milk the emplo do their work with greater ease, with greater accu and there is less loss of time from work on accoun illness."

National Cash Register plants in Dayton were as examples, and officials of that company had incr the efficiency of its employees and created better he conditions and standards, was claimed by Mr. Maug

Others scheduled at this meeting were: Discus by Frank Moore, Moores & Ross, Inc., Columbus; Lindner, Milk Service, Inc., Dayton, and R. A. Lar Supreme Dairy Co., Alliance.

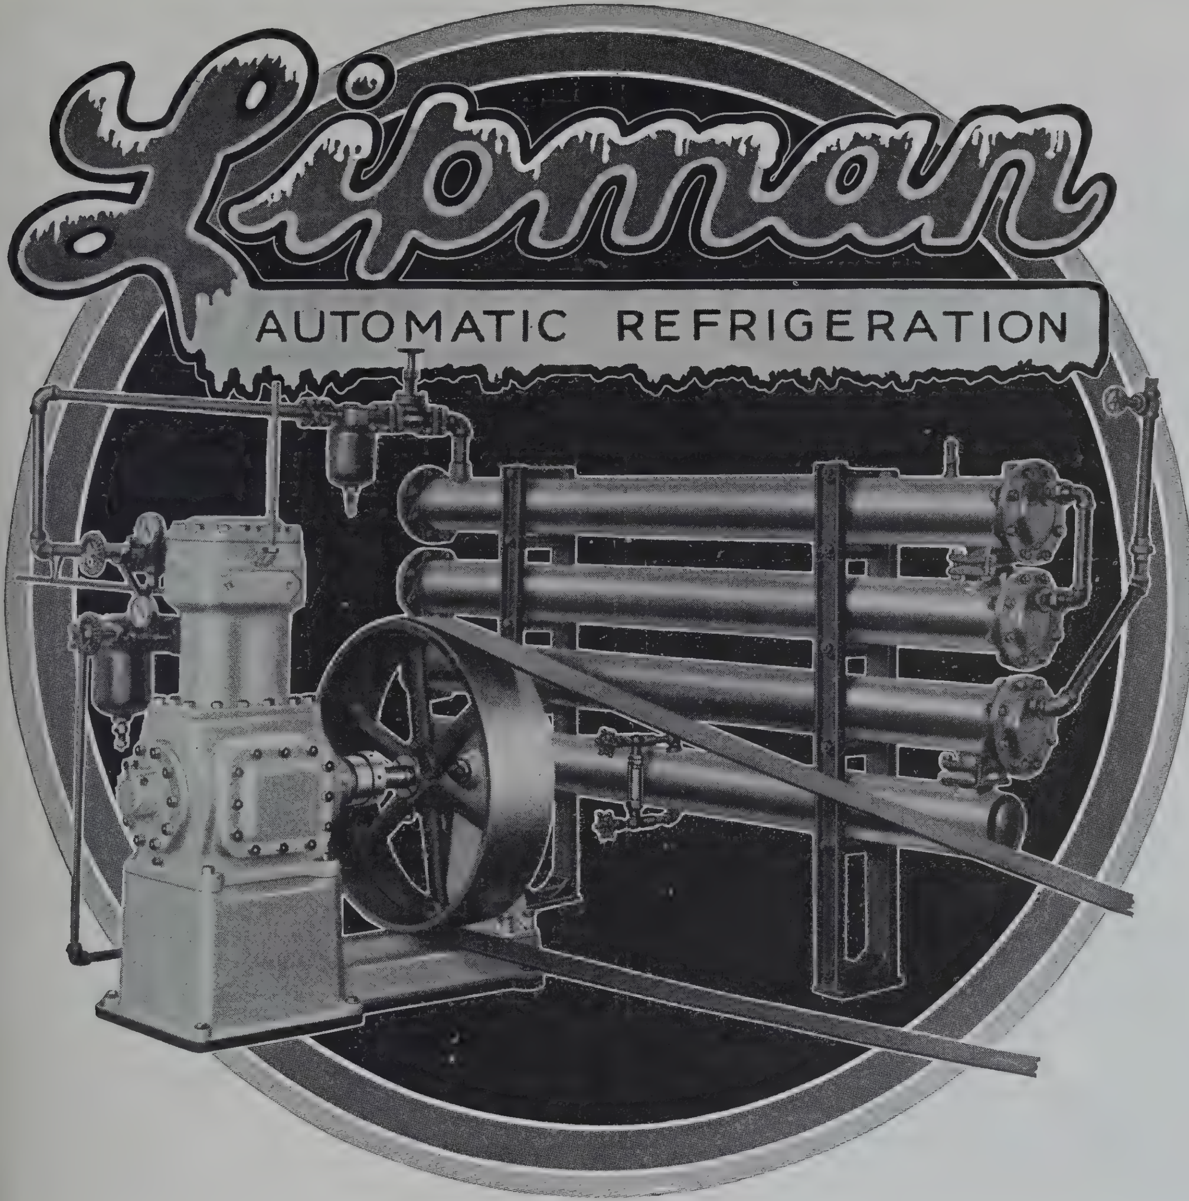
"Stimulating the Use of Milk in Schools," by Roueche of the Telling-Belle Vernon Co., Cleveland, also scheduled.

H. D. Hooge, Mathews Select Dairies Co., Cincin led a discussion.

Management Conference.

In the Milk Plant Management Conference div for the afternoon, the following were scheduled: " tion of Man in Plant to Promotion of Milk Sales," b O. Dreyer, Dairy Products Company, Dayton. "Fac Labor Problems," by John F. Kofron, Clover Mea Creamery Co., Cleveland.

The discussions scheduled were: "Methods of C



dvantages *of* Lipman Refrigeration

First, is the *time saved*. Milk dealers find that Lipman Full-Automatic Refrigerating Machines operate day-after-day, indefinitely, with the minimum of attention. That saves money in labor costs.

Then, the actual *operating cost*, in current and water consumed, is very low. Lipmans are most economical. That saves cash.

Finally, the *life of a Lipman* Machine is so long, thanks to high manufacturing standards, that they give good service for a very long time. That distributes the original investment, making a lower than usual capital cost when measured in terms of service.

There's a Lipman Sales and Service Station near you, available at all times. Get a demonstration. Write us for Descriptive Folders and booklets giving complete information.

In the Milk Sales Conference afternoon meetin
the second day session, the following program was
ried out: "The Best Way to Develop Route Salesm
by C. B. Siddall, Akron Pure Milk Co., Akron.

A discussion was lead by Allen French, Towns
West Dairy, Cincinnati, and Harry Himes, Himes
Dairy, Dayton.

Horse Important Factor.

It seemed that Dobbin's job drawing the milk wa
is secure from a talk given by H. F. Meyer, Dairy P
ucts Co., Cleveland, on "Motorizing Milk Routes."
horse is still a much desired factor, in the milk indu
at least, and the picture of a horse hitched to a
wagon is one that will never fade, if the conclusion
Mr. Meyer can be taken as a criterion.

The horse still is an economical factor in delive
milk to customers over a prescribed route, altho
motor trucks are used where the route is large and
is served in bulk. "Old Dobbin still is an important
tor in delivering milk to customers," said Mr. Me
"we have found from experiments that the horse is
the most economical factor in delivering milk, an
present there is no adequate substitute for him.

"The cost of operating milk trucks for route d
ery is high as compared with the operation of h
drawn vehicles. The wear and tear of starting an a
mobile and stopping every few hundred feet to de
a pint of milk is not economical. Here is where
horse can surmount the automobile in efficiency; in
hauls automobiles are more economical."

The discussion was made by H. C. Moores, Moor
Ross, Columbus; B. A. Millikin, Youngstown San
Milk Co., Youngstown, and C. R. Billingslea, Kimb
Grove Co., Columbus.

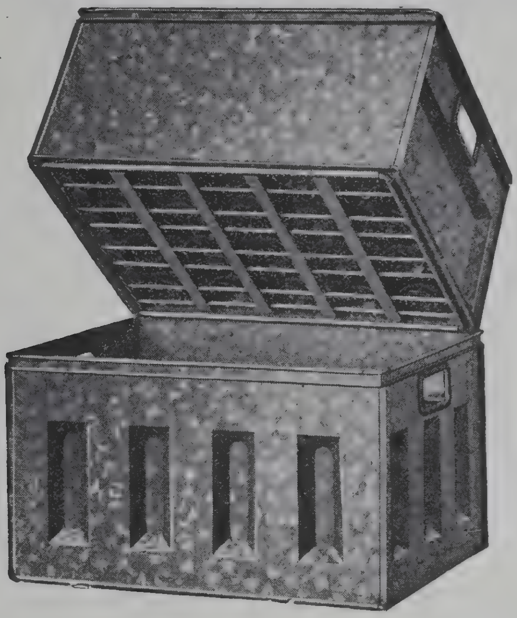
"Does it Pay to Use Novelties or Premiums wit
Retail Customers," was handled by Geo. B. M
Hiland Dairy Co., Newport, Ky.

A discussion was given by V. F. Trout, Purity
Cream and Dairy Co., Springfield, and E. C. Gre
Browning-Greiner Dairy Co., Zanesville.

The Ohio Milk Distributors' Association, after li
ing to good speakers discuss their problems, hear
nominating committee report on the election of of
for the coming year.

C. B. Alexander, Akron, was nominated for p
dent, B. A. Millikin, Youngstown, for vice-presiden
E. E. Foreman, Columbus, for treasurer. As the n
nating committee reported no opposition, these
tioned will undoubtedly be elected.

*f*OR Perfect Stacking



CLIPPER CASES

Clipper cases stack perfectly without the hazard of sharp projecting stacking irons. You can move high stacks of Clipper Cases without any danger of shift or sway.

The stack stays rigid, all of which avoids disastrous accidents that cause so much loss in broken bottles and product.

Furthermore Clipper Cases absorb no extra weight. They need no repairs. Their cost is an actual saving over many wood cases. And—

How they do Last.

You will never know until you try them.

Milk Plant's Experience With Cost Syster

How the Association System Has Made Routes Pay. Extracts from an Address at Detroit Convention of International Association of Milk Dealers

By J. D. DUNGAN*

HAVING known of the task undertaken by The International Association of Milk Dealers, that of the development and adoption of the Uniform Cost Accounting System, we decided to install the system during the year 1924.

Prior to this time we had at different periods employed the services of public accountants to recommend and install accounting systems particularly adapted to the milk dealer, and in our opinion based upon our experience of milk accounting procedure, were using what we termed a fairly successful system of accounting but were limited as to unit cost as well as detailed analysis.

When the general operation of the building of the Uniform System began we sent representatives to meet with the executive and preparation committees and were soon convinced that the Unit Cost System was just what we needed to more successfully manage and operate our plant.

Therefore, we purchased the Manual of the Uniform Cost Accounting System and secured the service of Mr. T. J. Bolitho who spent some three weeks with the accountants of our plant, laying out the necessary forms and outlining the proper procedure for the correct installation of the system.

On June 1st, 1924, the installation in the cost field was begun and cost figures which were rather crude at first were determined, and on July 26th, 1924, the first condensed product operating statement showing unit product cost was submitted.

The Uniform Cost Accounting System as far as the financial field was concerned was not installed until January 1st, 1925. This delay was not due to the fact that the financial field could not have been installed at an earlier date, but on account of the fact that departmental comparisons under the system then in use were considered desirable until the end of the year 1924.

Since January 1st, 1925, we have been operating the Uniform Cost Accounting System in its entirety. The figures submitted at first were crude but each succeeding month found them to be more and more reliable until at the present time we have the utmost confidence in the accuracy of the figures submitted.

Numerous investigations and tests have proven that the many accounting problems peculiar to the industry are being handled in the most logical and scientific manner under the operation of the Uniform Cost Accounting System.

This, no doubt, is a direct result of the foresight employed by our secretary, Mr. R. E. Little, and the accounting manager, Mr. T. J. Bolitho, who persistently insisted that the system should be built by the accountants within the industry.

This system is the means of furnishing the management with intelligent reports concerning all activities of the business. Through the information contained on our daily product reports we are enabled to reduce our product loss to a minimum. These reports have exposed several leaks which were quite expensive and of which we were entirely unaware.

This system provides balance sheets, both detail
condensed, in a form that will meet the requirements
the most exacting banker. And it provides for c
parative departmental reports which are of the utm
value in plant management and control. It provi
operating statements which reflect the actual results
operation. These operating statements we have fou
through actual experience can be compiled so as to ac
rately show the actual results sustained in any or
operations.

If, for any reason, special reports or statements r
tive to any department or to any phase of the busin
are desired the operation of the Uniform System
make this information available. The reports or sta
ments can be drawn in exactly the form desired,
matter how condensed or how detailed the requireme
may be. In fact, the system has no real limitations
those who know and understand its flexibility.

All these statements are necessary and vital to
management of a successful business, but the statem
from which we have derived the most benefit, the sta
ment which has caused us to effect the greatest savi
the statement which has given us the closest and,
believe, the most valuable control, is the Statement
Profit and Loss on Individual Routes.

It is presumed that all milk dealers who oper
routes know the gross sales on each of those routes.
know that milk dealers operating the Uniform Cost
counting System know their product costs, but we
know that this information, in itself, is not sufficient
effect a sales control.

We know that the products cost vary with each ro
We know the costs incidental to operation vary
each route, and unless we have these product costs
these operating expenses properly allocated to each ro
we cannot hope to know actual results sustained on e
route.

The Uniform System of Cost Accounting is such
it enables the operator to charge directly each r
with the cost of products sold; it enables the opera
to charge such expense as returned product loss, sa
men's salary and commission, vehicle expense and
debts directly to the route affected, leaving only s
supervision, advertising, etc., and administrative
pense to be distributed on an indirect basis. A car
analysis of this statement will reveal the effect of
or all conditions obtaining on each route.

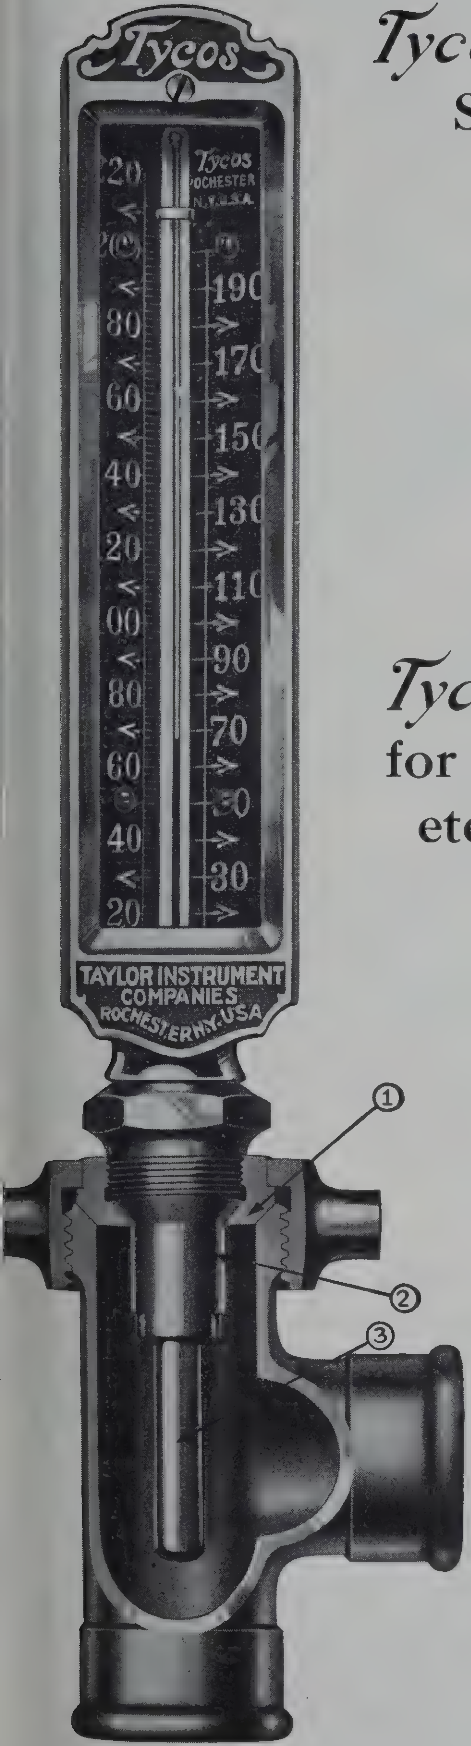
It, then, becomes the duty of the sales executiv
locate the cause, if the cause itself is not indicated,
to immediately take steps to correct the condition.
may mean that the salesman is inefficient, or that
territory should be redistricted, or one of many o
reasons.

From this statement subsidiary operating statem
are prepared for each route, the subsidiary stater
shows only the figures affecting the route for which
are compiled.

The Sales Manager is then in a position to de
strate to the route salesman the reason and nece
for the demands made on the salesman by the man

---

* Polk Sanitary Milk Co., Indianapolis, Ind.

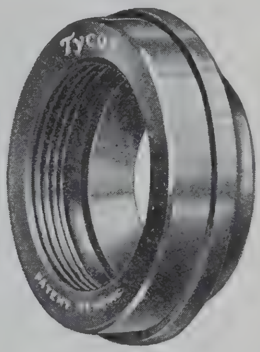


Tycos Industrial Thermometers with Sanitary Ferrule for Milk Lines

The dependability of ***Tycos*** instruments for use in the milk industry is well-known. To further their usefulness and to show a new standard of cleanliness and sanitation, the ***Tycos*** Sanitary Ferrule has been developed and placed on the market. It is another example of the thoroughness with which the ***Tycos*** engineers, with their knowledge of your industry, solve and anticipate your needs.

Tycos Sanitary Ferrule for Applying Thermometers and Regulators to Milk Lines

(PATENTED DEC. 7, 1926)



This Ferrule can be installed on all milk pipe lines. It is furnished for any size tee or cross of I. A. M. D. specifications.

All ***Tycos*** Indicating, Recording and Controlling instruments with connections for this sanitary ferrule are interchangeable in any size of ferrule.

The ***Tycos*** Ferrule has no thread to come in contact with the milk, consequently it offers no dead pocket for the propagation of bacteria. By its use the bulb of the temperature instrument is directly in the milk flow, where true temperature conditions exist.

Write for additional information on the **Tycos** *Sanitary Ferrule and for milk plant calalog No. 500-A.*

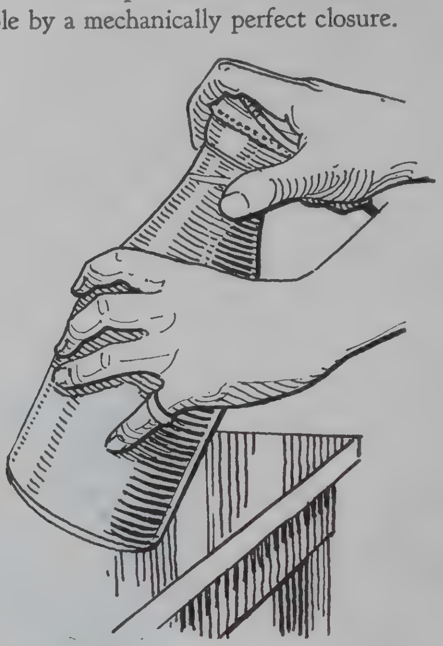
THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

PASTEURIZE YOUR MILK
IN-THE-BOTTLE

THE
Crown Cork & Seal Co.
BALTIMORE, U. S. A.

Inventors and originators of the famous "Crown Cork"

ment. He has concrete figures which he can subm the salesman to prove conclusively to him that th mands of the management are justified.

When the salesman, who has the interest of his ployer at heart, as well as the ambition to advanc own interest, is confronted with the figures showin existing conditions on the route in his charge, he at once realize the responsibility imposed on him exert his best efforts to the end of placing his rou a basis that will prove mutually profitable to both company and himself.

The Sales Manager receives many constructive gestions advanced by the salesman in the discussio conditions on his route. In many instances the through his own efforts, can make his route profit in others, the services of a solicitor or route fore working with the salesman can achieve the desire sults.

If, however, after exerting all means at his disp the Sales Manager finds that the conditions on the have not improved, and a careful survey of the terr indicates that the business cannot be increased or it would be unprofitable to increase business in locality, then redistricting may be considered. If redistricting is so planned that the service is not paired in any degree, then it serves as a very sati tory method of eliminating unprofitable routes.

The value of this statement in effecting the eco ical distribution of products should not be under mated. It is a safeguard against avoidable losses; when properly applied, the best assurance of main ing or increasing earning power and once used prove so beneficial to successful management that it become a permanest statement eagerly awaited by management.

The Uniform System of Cost Accounting has found to be economical, reliable and efficient in operation. It is the means of furnishing informatio which the milk dealer has long felt the need. It has stituted facts for conjectures, in that through its o tion the milk dealer is enabled to know his costs, with this knowledge to proceed in a more intelli manner.

It is, beyond a question of doubt, the greatest which accountants could place in the hands of thos gaged in the industry.

⁂

MILK AND GELATINE.

There are many people who, while they like find trouble in digesting it. Gelatine added to milk to prevent the formation of hard curds in the stor and increases the available nourishment and digesti of the milk.

Gelatine can easily be added to milk according t following formula:

1. Soak for ten minutes one level tablespoonf gelatine in one-half cup cold milk.
2. Place cup in boiling water and stir until ge is thoroughly dissolved.
3. Return dissolved gelatine to original qua milk.
4. For smaller quantities of milk reduce gelat proportion.

The addition of gelatine to buttermilk in the way produces a smoother and more palatable drink

Over 500 Dairies are using

KOKO-MALT

It's Making a Big Hit!

for their

Chocolate Malted Milk Drinks

HERE is a new product which is blended from a special Dutch-processed, double milled cocoa and pure barley malt extract with special flavoring to intensify the full chocolate flavor and absorb the bitterness of cocoa.

DAIRIES bottling chocolate milk should be interested in this new preparation. It means a great saving in your syrup purchases. The cost of one gallon of delicious chocolate malted syrup made from KoKo-Malt, which is sufficient to flavor 10 gallons of milk, is 75 cents.

We will be glad to send a sample of KoKo-Malt sufficient to make one gallon of syrup to those interested in this new hit.

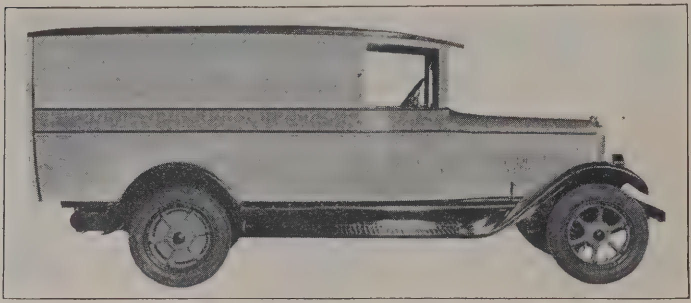
NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing
to Develop the Industry. We Invite Correspondence Relative
to New Products and New Equipment.

NEW ONE AND TWO-TON TRUCKS.

Official announcement has been made by John Hertz, chairman of the Yellow Truck and Coach Manufacturing Company, that early in 1927 they will market trucks of one and two-ton capacity equipped with the over-head valve, six cylinder Buick engines. A complete line of these trucks were exhibited for the first time at the New York National Automobile Show. This news is the logical outcome of the amalgamation of the Yellow Truck interests with the General Motors.

These new one and two-ton trucks have had the most grueling tests at the General Motors proving ground, under the supervision of General Motors engineers.



Model T-20 Yellocab Express, one ton truck, with vestibule type driver's compartment.

They are built to meet present-day needs, according to Mr. Hertz, the six cylinder power plant insures maximum acceleration and flexibility. They are capable of operating at unusually high speeds and the braking equipment insures quick stops. The two-ton trucks are equipped with four-wheel brakes.

The new one-ton Yellocab Express and two-ton Yellocab Merchantman, which will be manufactured at the General Motors Truck Company, Pontiac, Mich., make their bow with a number of advanced features. All will be equipped with the Buick power plant, self-starters, extra heavy truck type of axles. and on the two-ton models four-wheel Bendix brakes.

The engineers had in mind in the construction of the new models these essentials—simplicity, ruggedness and economy of operation. At the same time every consideration was given to provide the driver with the utmost comfort. Care and attention was also given to the matter of appearance in both chassis and body—the lines are pleasing and one gets an impression of rugged simplicity. The new chassis will be sold with or without bodies. A full line of bodies is announced with the line.

The one-ton model T-20, with a chassis road weight of 2,750 pounds, will have a wheelbase of 132 inches. The two-ton model T-40, with a spiral bevel axle and pneumatic tire equipment, has a chassis road weight of 4,325 pounds and will be furnished in three wheelbases, 136, 150 and 162 inches. The two-ton model T-50, with a worm axle and solid tires, will have a chassis road weight of 4,630 pounds and will have the same wheelbases as the model T-40.

These three new models give this company a range of trucks from one to fifteen tons capacity.

* * *

AUTOMATIC CAUSTIC TEST.

Louis F. Nafis, Inc., Chicago, Ill., manufacturers of scientific glass apparatus for testing milk and its products, has placed on the market an automatic caustic test which is said to be indispensable to operators of automatic bottle cleaners. This apparatus helps the operator to determine and control the caustic concentrations of soaking baths used in chemical disinfection of glass containers, including milk bottles.

The Nafis test enables one to test the purity of washing powders and to determine the percentages of caustic soda and soda ash contained in the washing powder. It is claimed that a washing powder containing from 60 to 76 per cent of soda will be the most efficient and economical for use in dairies.

LENDERKING RETIRES AS PRESIDENT.

On January 31st W. R. Lenderking, president and
tor of The Purity Paper Vessels Company, Clipper Mill,
more, resigned all connection with the above firm. He has made no definite plans for the future, but his friends will hope that he will remain identified with the industry.

Mr. Lenderking is one of the pioneers in the field of containers for ice cream. He has been connected with the above company since its start, except for about 18 months that he spent in the navy during the World War. About three years ago, when the American Association of Paper Specialties Manufacturers was formed, Mr. Lenderking was made president. He is now at his home at Maple Ave. Dixon Hill, Mt. Washington, Baltimore, Md.

W. R. LENDERKING.

R&A introduces

R&A Little SOAKER-HYDRO BOTTLE WASHE

MANY owners of progressive smaller milk plants have looked with envy on the powerful equipment of the big plants—and hoped that someone soon would bring out a really worth-while idea in a hydro-soaker bottle washer for the smaller dairy—

Someone has!

R & A presents this little Soaker-Hydro with the firm conviction that, in size, capacity, efficiency, durability and price, *it meets your requirements as no bottle washer has ever met them before!*

It uses a most reliable adaptation of the hydro-soak principle, made doubly effective by the way the machine is timed, the position of the jets and the power of the washing units.

It is moderate in size; measures only 16 ft. over all, 4 wide model handles 24 or 32 bottles per minute; the 6 wide, 36 or 48 bottles per minute. Load and unload at one end.

It is a trouble-free washer: All mechanical operating units of simple design, and located on outside of machine. Instantly accessible. Easily maintained. Its two hydro pumps are operated by 5 H. P. Motor, which also drives the machine. The entire washer is guarded thruout by automati safety stops.

It is a fair-priced washer: Establishing a new standard for extreme high quality and service at a price well within reach of the smaller dairy—the 4 wide *costing less than $3500.00 fully equipped!* Tested—proved—ready for your call!

NO OBLIGATION

when you write for information.

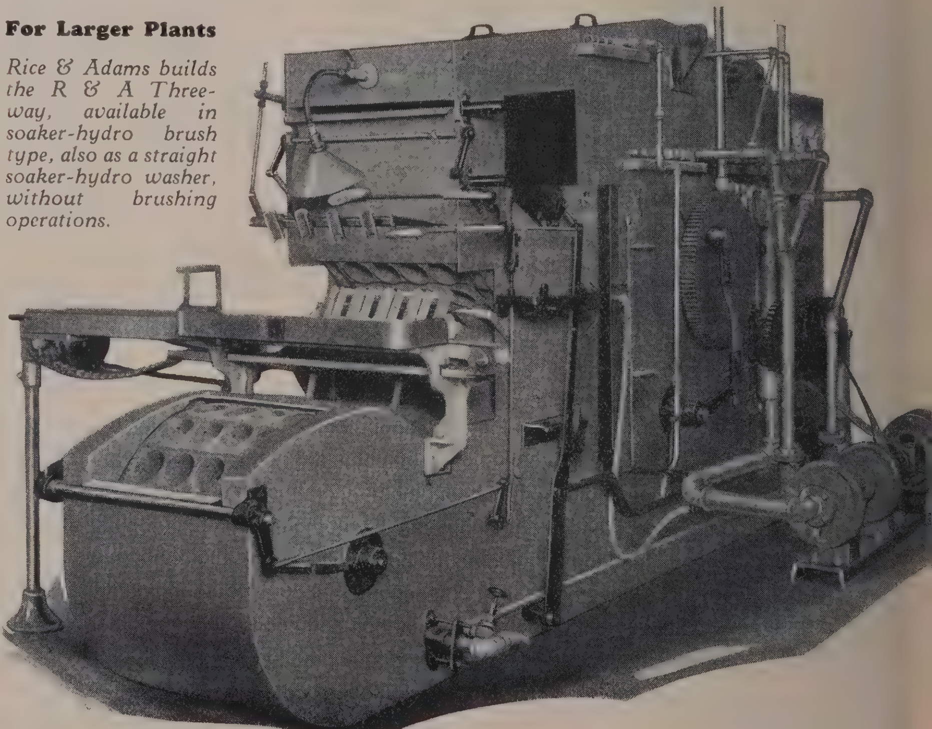
Do not hesitate to write for complete information on both the R & A Little Hydro-Soaker and the new R & A Cover-placing Can Washer. We'll send you complete details of their construction and operation just as soon as we get your letter—also exact prices.

Make the request today. The obligation will be all ours!

RICE & ADAMS CORPORATION
1144 Military Road
BUFFALO, N. Y.

For Larger Plants

Rice & Adams builds the R & A Three-way, available in soaker-hydro brush type, also as a straight soaker-hydro washer, without brushing operations.



When writing to RICE & ADAMS CORP. *please mention The Milk Dealer.*

two new washers

&A COVER-PLACING CAN WASHER

THE most economical, efficient, completely accessible and trouble-free can washer you have ever seen—

Equipped with a perfectly designed cover-replacer; the only one built which recovers *both* eight and ten gallon cans with equal ease and precision.

That's the new R & A Cover-placing Can Washer! *Built to do more for you at lower first cost and maintenance cost than any can washer ever offered you before.*

Right in your plant it will turn out up to twelve flawlessly clean, bone-dry cans and covers every minute of a 24-hour day if you wish—and do it for years into the future, with a minimum of labor.

It will automatically place the covers on the same cans with which those covers are fed into the machine.

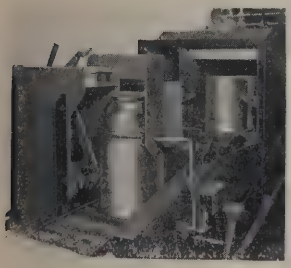
Entire washer operates automatically, and every mechanical part which might need adjustment is accessibly located on outside of machine.

You will like equally, the way it is designed, the way it is built, and the way it works.

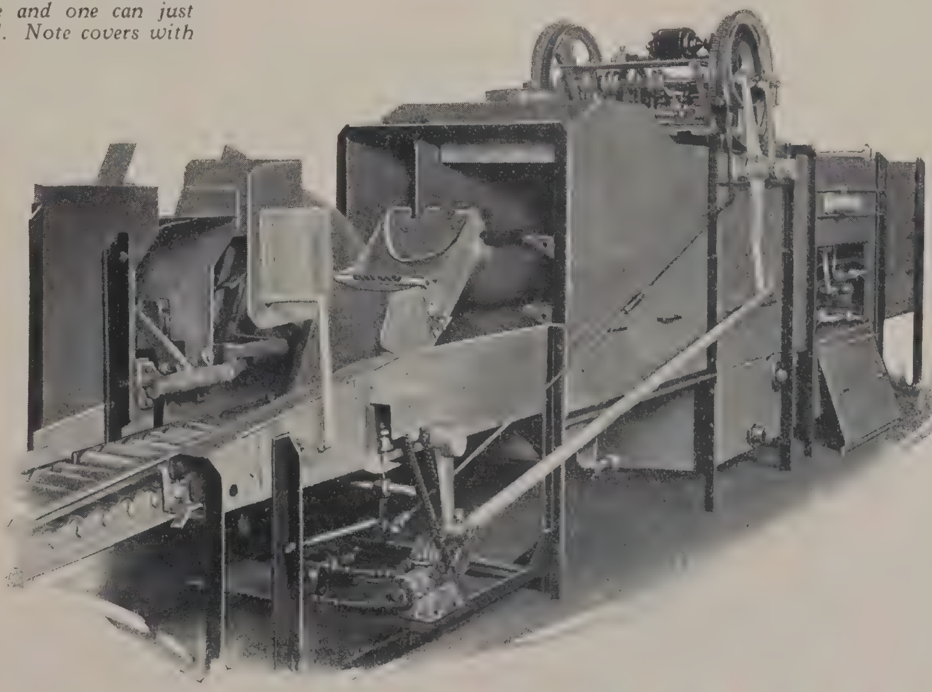
You will approve its first cost—and commend its operating cost.

As for the character of its service—that to you will be priceless!

One can at last position in washer, one can in uprighting cradle and one can just re-covered. Note covers with cans.



One can at last position in machine, one can at cover-placing position—just about to receive cover.



When writing to RICE & ADAMS CORP. *please mention The Milk Dealer.*

Sealed—Very slight change; taste just slightly off, but would be consumed by the average person without comment.

2. Sweet cream:

Bacteriological changes taking place in sweet cream stored in open and sealed containers when the cream is held at 70 degrees F.

Character of cream:

Raw cream testing about 46 per cent milk fat was obtained from a well mixed batch of cream (265 pounds) placed in sealed and open mason jars and placed in the 70 degrees F. incubator. (Mason jars sterile.)

Condition of cream at start:

	Per c.c.
Total bacterial content on standard agar	9,500,000
Total acid content on lactose agar	11,700,000
Putrefactive content (liquifiers of gelatine)	300,000
Yeasts	160
Molds	Less than 10

The acid bacterial content shows higher than the total, this being due to a more favorable medium for the growth of the lactic group.

Condition in 5 hours:

Counts in numbers per c.c.	Open	Sealed
Total bacterial content on S. N. A.	872,000,000	542,000,000
Total acid content on lactose	658,000,000	540,000,000
Liquifiers of gelatine	7,000,000	1,400,000
Yeasts	160	160
Molds	Less than 10	Less than 10

It will be noticed that the acid count is nearly equal to the total count, this showing the favorable conditions for their growth which in turn inhibit the liquifiers. Important because of rapidity of the reaction.

Condition in 24 hours:

	Open	Sealed
Total bacterial content on S. N. A.	453,000,000	255,000,000
Total acid content on lactose	80,000,000	38,000,000
Liquifiers of gelatine	110,000	80,000
Yeasts	160	160
Molds	Less than 10	Less than 10

Condition in 48 hours:

	Open	Sealed
Total bacterial content on S. N. A.	381,000,000	203,000,000
Total acid content on lactose	64,000,000	23,000,000
Liquifiers of gelatine	60,000	30,000
Yeasts	12,000	2,000
Molds	3,000	Less than 10

3. Value of shipping milk in sealed containers:

Character of milk:

after placement in jars, the inoculation having been accomplished during the manufacture of the cheese.

Mornings milk from a first class dairy—one-half sea in mason jars and inverted; the other half not sealed but clamped down. Incubation at 70 degrees F.

Condition of milk at start:

Acidity, per cent	.1
Count on standard nutrient agar	25,
Count on lactose nutrient agar	13,
Liquifiers of gelatine (putrefactors)	1,

Condition in 3 hours:

	Open	Sea
Acidity, per cent	.1692	.16
Count on S. N. A.	21,000	8,3
Count on lactose agar	19,900	8,8
Liquifiers of gelatine	3,000	2,4

The drop in count due to change of conditions and clu ing of bacteria. (Germicidal action.)

Condition in 6 hours:

	Open	Sea
Acidity, per cent	.1728	.17
Count on S. N. A.	87,000	85,0
Count on lactose	29,000	82,0
Liquifiers of gelatine	3,500	2,0

Sealing is favorable to the growth of acid organisms u a certain concentration.

Condition in 9 hours:

	Open	Sea
Acidity, per cent	.180	.
Count on S. N. A.	890,000	420,
Count on lactose	350,000	320,
Liquifiers of gelatine	20,000	8,

Condition in 24 hours:

	Open	Seale
Acidity, per cent	.270	.2
Count on S. N. A.	36,000,000	108,000,
Count on lactose	14,000,000	59,000,
Liquifiers of gelatine	400,000	100,

The flora of the sealed was nearly a pure culture of la organisms, while the flora of the open showed large numb of aerogenes and other undesirable organisms.

Condition in 48 hours:

	Open	Sealed
Acidity, per cent	.792	.7
Count on S. N. A.	542,000,000	790,000,
Count on lactose	490,000,000	1,010,000,
Liquifiers of gelatine (over)	1,000,000	200,

The flora of the sealed was nearly pure lactic, and wh is also shown by its dominance on the lactose media. Li

fiers of gelatine in open container had completely liquified the 1-1,000,000 dilution, showing that their numbers were in excess of 1,000,000 per c.c.

4. Sweet cream:

From a well mixed vat of freshly separated sweet cream, 12 one-half pint mason jars were filled. Six were sealed and inverted while six the lid placed on and clamped but not sealed with the rubber gasket.

Temperature of incubation was 80 degrees F.

Initial acidity, per cent	.14
Total bacterial content on S. N. A.	9,200,000
Liquifiers of gelatine	600,000
Yeasts	100
Molds	10

Results expressed in numbers per gram of cream.

Condition in 24 hours:

Sealed cream slightly less viscous than that in open container.

	Open	Sealed
Acidity, per cent	.540	.560
Total bacterial content	21,100,000	31,000,000
Liquifiers of gelatine	300,000	110,000
Yeasts	600	110
Molds	10	Less than 10

Condition in 48 hours:

Physical—the sealed container's cream was considerably less viscous than the open. (Greater ease in sampling.)

	Open	Sealed
Acidity, per cent	.62	.68
Total bacterial content	Contaminated	24,900,000
Liquifiers of gelatine	1,000,000	5,000
Yeasts	51,000	Less than 10
Molds	3,800	Less than 10

Condition in 72 hours:

Some noticeable difference in viscosity.

	Open	Sealed
Acidity, per cent	.71	.73
Total bacterial content	66,000,000	82,000,000
Liquifiers of gelatine	100,000	100
Yeasts	210,000	40
Molds	4,500	Less than 10

The flora of the sealed was nearly pure lactic.

Condition in 96 hours:

No difference in viscosity.

	Open	Sealed
Acidity, per cent	.78	.86
Total bacteria	178,000,000	15,800,000
Liquifiers of gelatine	50,000	200
Yeasts	930,000	40
Molds	210,000	20

Condition in 120 hours:

No difference in viscosity.

	Open	Sealed
Acidity, per cent	.95	1.05
Total bacteria	76,000.000	4,600,000
Liquifiers of gelatine	50.000	Less than 100
Yeasts	1,300.000	40
Molds	290.000	130

Condition in 144 hours:

No difference in viscosity.

	Open	Sealed
Acidity, per cent	1.05	1.18
Total bacteria	16,800,000	1,200,000
Liquifiers of gelatine	40,000	100
Yeasts	300,000	40
Molds	800,000	150

Summary.

1. Sealing milk, cream and cottage cheese retards the growth of proteolytic bacteria and thereby enables the products to keep in good condition for a longer period of time.

2. Sealing milk and cream enhances the growth of the pure lactic type of organisms over the undesirable types, thereby giving cleaner and more desirable flavors.

3. Sealing cream retards the growth of yeasts and molds, which are destructive to flavors of desirable quality.

4. Sealing cream up to 72 hours decreases the viscosity of cream.

5. Sealing milk or cream causes a decrease in total numbers of bacteria up to a definite time which is dependent upon temperature.

REID JOINS ELECTROPURE SALES CORPORATIO

The Electropure Sales Corporation of Pittsburgh
nounces the appointment of A. E. Reid as district sales
ager with headquarters at Philadelphia.

Mr. Reid will represent the Electropure Sales Corp
tion in eastern Pennsylvania, New Jersey, Delaware, Maryland, District of Columbia, Virginia, North and South Carolina, Georgia and Florida. His temporary address is 39 Narbrook Park, Narbeth, Pa.

A. E. REID.

Mr. Reid's father was founder of the A. H. Reid Creamery & Dairy Supply Company. For more than 15 years A. E. Reid was associated with his father in the dairy machinery business.

After the death of his father, A. E. Reid, then secretary, treasurer and general manager, retired from the Reid company. Recognizing it as an opportune time to gain a broader knowledge of general business and the dairy business in particular, he entered the Babson Institute at Babson Park, Mass.

Mr. Reid's association with Electropure is the resu
exhaustive research. The study of reports of previous i
tigations conducted on the electrical treatment of mil
cluded those of The National Research Committee of
land, Robinson Laboratories, Michigan State Departme
Health, Cornell University, Rieck-McJunkin Dairy, North
lic Health Service, Massachusetts Institute of Techno
Pennsylvania State Department of Health, Dr. I. F. Hudd
of Michigan State College, Dr. C. M. Carpenter of New
State Veterinary College, and the National Certification
oratories.

A NEW BOTTLE WASHER.

The A. H. Arnold & Company, 718 West Randolp
Chicago, has been appointed the sole distributor for
Ladewig-Soelch Super-Eight Bottle Washer. This new
chine has been designed by A. E. Ladewig and G. F. Sc
both of whom have had many years in designing and b
ing bottle washing machines. Some of the features

(Continued on page 126)

'HE USE OF GELATINE IN BUTTERMILK.

(Continued from page 36)

·hat it actually is. It is not really buttermilk."

ıe city of Cambridge, Mass., likewise endorses the f gelatine in buttermilk. Robert E. Bemis, Ph. C., tor, laboratory division, saying: "The use of gel- in commercial buttermilk, in our opinion, would addition to the food value and aid the appearance ə product as well.

Gelatine is not used extensively by milk plants in section. Some that have tried it out have discon- d its use, claiming that no advantage has been n. The value of it may be recognized more fully time in the future. It would be permissible to use ine in buttermilk because all cultured buttermilk labelled." The last sentence means, of course, cultured buttermilk is labelled "cultured butter- " and the inference is drawn that that would per- he use of gelatine without further disclosing what ntained.

oratio N. Parker, bacteriologist and chemist of the h department, Jacksonville, Fla., writes: "I would hat I believe that there would be no objection to ovided the bottles bore a statement of the amount ntained gelatine on the bottle cap. This would not ate against the sale of the product I am sure for ordinance of the city requires a statement of the oximate butterfat content of sweet milk on the so that our public is used to this sort of labeling." hat the question of gelatine in buttermilk has been ned" through the inquiries which The Milk Dealer addressed to these authorities is evidenced by the received from Theodore B. Appel, M.D., secretary ealth for the commonwealth of Pennsylvania, who es: "This is a new subject and I wish to confer the department of agriculture before making final sion. This I hope to do within a few days."

Iilk dealers in Chicago, our second largest city, evidently been slow in taking up this subject for lynamic commissioner of health, Herman N. Bunde- M. D., writes: "....no Chicago milk dealer has re- ted permission to use gelatine in commercial but- ilk, and we do not care to make a statement regard- this matter without thorough investigation." The that "no milk dealer has requested permission" e startling revelation contained in this epistle, for tine in buttermilk is a ripe, timely topic for con- ation of milk dealers for, as we shall show later, se has been proven to improve buttermilk in several s. Therefore, its use by milk dealers in America's ing city of PEP would seem imminent.

'Out where the tall corn grows," Iowa, although er acknowledging that the subject has not had too h consideration, is not unfavorable to the use of tine, for the department of agriculture, with the ature of E. L. Redfern, writes: "....pending fur- information and investigation on the use of a l amount of edible gelatine in cultured buttermilk, will offer no objection to its use."

very interesting angle to the question comes up letter received from a professor of dairying at one he large state universities in the East. He writes in his opinion it would not be right to use gelatine uttermilk if it were added to improve an inferior luct, or to make a product resemble one of higher ity. This, of course, is not at all the intention. The ermilk would be improved, in several ways, but ld not in any sense be an imitation of a higher qual- product. The use of gelatine in buttermilk does not n that a poorer quality product is to be manufac- d and "doctored" with gelatine but the highest

Improve the Quality of Your Buttermilk

and Prevent Wheying Off!

THE addition of a very small amount of good gelatine to commercial buttermilk effects a wonderful improvement. Gelatine prevents wheying off, softens the curd through keeping it finely divided, retards excessive acid, making a smoother, creamier product that will please your customers and bring them back for more.

ESSEX GELATINE

Ax, the Gelatine used by manufacturers of the highest grades of ice cream, is highly recommended for cultured or natural buttermilk. The slight additional cost for small quantity of gelatine used is more than offset by increased sales through highly improved quality.

Let us send you instructions for its use, with a sample and prices.

possible quality of buttermilk is to be improved by the addition of a very small amount of gelatine.

Bacteria, Food Value and Colloidal Action.

A. C. Fay, dairy bacteriologist of the Kansas Experiment Station, lends considerable light on the entire subject, writing: "My investigations on gelatine have been limited to a study of the bacterial content of the various grades of gelatine available to the ice cream maker. Although the bacterial content of the gelatines examined have varied between the extremes of 0 to 108 millions per gram, nearly half of them (48 per cent) contained less than 1,000,000 bacteria per gram. Pasteurization of 22 samples at 145 degrees F. for 30 minutes resulted in an average destruction of 98.8 per cent of the bacteria, although in some samples, containing very few bacteria, pasteurization failed to reduce the count, whereas in the gelatine containing large numbers of bacteria the efficiency of pasteurization was 99.9 per cent.

"The results of experiments at this station lead inevitably to the conclusion that so far as the number of bacteria in gelatine is concerned, it is an insignificant source of contamination in ice cream, especially if it is pasteurized. In view of the small per cent added to gelatinized buttermilk, the same conclusion is warranted.

"Although it is well established that the actual number of organisms added is not significant as to the kind of bacteria introduced, I believe the inocuousness of gelatine is well proven by the widespread use of this product in ice cream. If the product is manufactured under well regulated inspection I can see no justification from a bacteriological point of view for the objection to its addition to dairy products.

"From the standpoint of nutrition, the addition of gelatine to milk, no doubt, adds to its energy value. However, I am not in a position to say whether or not it supplies any of the amino acids which are deficient in milk. I question very much if milk needs any fortification of this sort as a food.

"On the other hand, it is perfectly reasonable to conclude from a very simple experiment that the protective colloid action of gelatine in milk renders the acid curd more finely divided, and, thereby, affords more surface for enzymatic action. Divide a sample of milk in two parts and add gelatine to one. Curdle both samples of milk with hydrochloric acid; in the gelatinized milk the curd is so finely divided that it will filter through three or four thicknesses of filter paper and give a cloudy filtrate. The other sample to which no gelatine was added will give a clear filtrate even through a single thickness of filter paper.

"This experiment demonstrates in a rough way the differences in the action of the gelatinized and plain milk in the stomach. The finer curd of the gelatinized milk would permit of more surface action for the gastric juice and thereby more rapid digestion, although I am not so sure it would necessarily result in more complete digestion."

A. C. Dahlberg, chief in research of the New York State Agricultural Station, writing about "the attitude which pure food officials should take concerning the addition of gelatine to buttermilk," says that the question has been raised in New York. "It was my first impression," says Prof. Dahlberg, "that since gelatine is a pure food product and is added to buttermilk to improve the product rather than to cheapen it, that the free use of gelatine should be permitted. After discussing this problem with individuals in inspection work I have come in agreement with them that any buttermilk containing gelatine should be labelled to show gelatine content. It is self-evident that the pres of gelatine in buttermilk is advantageous from standpoint of healthfulness of the buttermilk. On other hand, buttermilk does not normally contain g tine and it seems to be a recognized principle in inspection work that whenever any abnormal ingred is added to the product the label should clearly s that it has been done. For that reason buttermilk taining gelatine should be properly labelled to show gelatine content.

"The situation is not different from that which f the ice cream industry about 20 years ago. At that gelatine was not a normal ingredient of ice cream for that reason most pure food officials insisted tha cream containing gelatine should be labelled. W custom established that gelatine was and should constituent of ice cream then it no longer becomes n sary to label ice cream containing gelatine becau has been established that gelatine was a normal cream ingredient. If custom ever establishes that termilk does contain gelatine then at some future the gelatine label will not be essential."

The facts are in favor of gelatine for improving termilk yet it is probably that the consuming, bu public will, as they did in the case of ice cream, not kindly to the buttermilk which bears a label saying gelatine has been used in its preparation, unless t is some publicity favorable to the use of gelatin buttermilk. It is true, of course, that the old, founded prejudice held against gelatine is dying, dying fast, but there is still much of it extant. It c be overcome by the milk dealer if, when he delive bottle of gelatinized buttermilk, he included a pamp or circular of some sort telling of the value of gela And gelatine manufacturers can do much to overc this natural handicap by broadcasting the remark intrinsic values of gelatine for human consumptio addition to telling of its cleanly production, its pu and the rigid law requirements which are met i manufacture.

C. D. Dahle, associate professor of dairy man tures at the Pennsylvania State College, also has s thing to say about gelatine in buttermilk. "I have interested in the practice of using gelatine in the ufacture of buttermilk," he writes, "but have not it commercially yet. We sell a considerable amou buttermilk and in some instances, possibly, could p by using gelatine especially in the summer months. far as the buttermilk sold directly from our sales is concerned, we seldom have need of gelatine to pre wheying off within a reasonable length of time. atine, therefore, is not necessary in that case. We sh not lose sight of the food value of dairy produc which gelatine is used. No doubt gelatine enhance food value of the buttermilk and certainly shoul be objectionable. I am not in favor of gelatine used to cover up slip-shod methods of making the mercial buttermilk."

Prof. Dahle brings out the important fact tha atine will retard the "wheying off" of buttermilk. fact has proven a series of experiments which are marized by T. G. Yaxis in a booklet entitled, The U Gelatine in Buttermilk, published by the Edible atine Manufacturers Research Society of America The summary and conclusions of these experi follow:

1. Churn or normal buttermilk will "whey regardless of whether it had been kept in or cold temperature. The addition of .25 per cent gelatine remedies this "whey off"

dition and produces a smoother drink which is preferred by the consumer.

2. In artificial buttermilk, where a higher acidity is developed, there is some danger of using too much gelatine. Gelatine .25 per cent is sufficient to prevent "wheying off" for five days, provided the product is kept at a temperature of 40 to 45 degrees F.
3. It was observed that the addition of gelatine to artificial buttermilk retarded the development of acidity in the product. This is important from an economic standpoint because most consumers prefer buttermilk with a fairly low amount of acid, about eight per cent.

That the use of gelatine in buttermilk will increase its sale, is one of the interesting things advanced by M. Messcher, New York, who is head of the scientific institute by that name for the creamery and ice cream industries. His letter follows:

"I have run several experiments and find that the use of gelatine in buttermilk will be one of the main factors to make the public drink more buttermilk, for the gelatine improves the texture and especially the flavor of the buttermilk.

"I have given samples of buttermilk which contain gelatine to people who never liked buttermilk and after they tasted the gelatine buttermilk they wanted more and wished to know why they cannot buy buttermilk which has as pleasant a flavor. The only answer I could give was that the health department does not allow the use of gelatine in buttermilk.

"If the health departments of big cities would allow the manufacturing of commercial buttermilk containing gelatine, and have the can or package properly labelled, the public would drink more buttermilk; which is now in the flush season of the milk production, run into the sewer by thousands of pounds and is a big loss to creamerymen.

"You take, for example, the ice cream. If the health department would not allow the use of gelatine and sugar in ice cream, which is a dairy by-product, what would there be left of the ice cream industry?

"I have made experiments on cultured buttermilk and used gelatine and sugar. This buttermilk was the most pleasant drink and if a milkman would put up a drink of this kind properly labelled, he would sell all of his surplus milk in the form of buttermilk, **under a certain trade name**, and the health department could not forbid the sale of such product for it will be a pure food and up to the standards of the pure food laws, for edible gelatine or sugar and gelatine added to buttermilk will be an industry, different than the regular creamery and be a separate department, as the ice cream industry is today."

Something of the misunderstanding regarding gelatine is expressed in a letter to The Milk Dealer by W. E. Miller, general manager of Coignet Gelatines, who says: "As you know, there is a wrong impression in the minds of some people to the effect that gelatine is nothing more than a high grade glue made of all sorts of animal raw material.

"Edible gelatines offered on this market are made of the very highest class hygienically, clean calf skin, pig skin, and beef bones and the process of manufacture further sterilizes these materials, in fact, the hygienic conditions prevailing in the production of gelatine in the modern gelatine plants are on a much higher scale of cleanliness than the average in which milk is produced.

"Gelatine holds a very essential position in the human diet which is only just beginning to be appreciated. It has a very high colloidal value, in other words, it sesses the function of breaking up the contents of stomach into small units making them vulnerabl the action of the digestive juices thereby facilita the process of digestion.

"Gelatine cannot, under any circumstances, be sidered an adulterant which should be emphasize all literature issued on the food value of a product taining gelatine, especially to the technical author on same.

"The federal and state authorities have establi certain standards of purity for gelatine. The s of the makers of gelatine is expressed in the fact this product today not only complies with these st ards but generally is well within the specifications of

A strong note of endorsement of gelatine in bu milk and other dairy products comes from E. H. Pa dairy bacteriologist in the department of dairy bandry at the Purdue University Agricultural Ex ment Station, who writes:

"I can see no reason why food officials should o to the addition of gelatine to buttermilk unless believe that the quality of gelatine used will be l than the quality of gelatine used in ice cream manu ture. A good grade of gelatine aids in the diges of casein and also adds some food value. The officials may think that the addition of gelatine to termilk may lessen the precaution of the butter manufacturer in care of selection of starter, pasteu tion and cleanliness of the equipment in which the termilk is made, for it is known that some of the tors that influence the wheying off of buttermilk cleanliness and purity of the starter and the typ contamination. I have discussed this question several other members of the department and they, myself, have no reason to offer that gelatine should be added to buttermilk.

"If we are to believe the experiments that have carried on at Mellon Institute, where such conclu evidence has been shown that gelatine is a neces product in our diet, there is every reason to expec increased consumption of buttermilk due to the that it has been gelatinated."

The gelatine manufacturers and the milk deale seems evident, have an opportunity to be mutually iceable in broadcasting the merits and the value purity of gelatine, while at the same time increasin sale of gelatine and of buttermilk, from which would make additional profit.

The question of gelatine in buttermilk is j coming before milk dealers and gelatine manufactu

Chicago Bottle Exchange Holds Annual Banquet and Frolic

"A good time was had by all," said Bill Jones, milk dealer of Chicago, as we were making our exit from the Gold Room of the Hotel LaSalle, Chicago, on the night of January 18, after attending the seventh annual banquet of the Milk Dealers' Bottle Exchange.

And Bill Jones "knows his stuff." A grand and glorious time was enjoyed by the seven hundred odd persons and personages who attended this annual festival of fun and enjoyment, for, besides a bounteous and pleasant repast, entertainment of interesting and diverting character, the crowd included only a gang of good fellows well met. And the handshakes, the greetings and the introductions were genuine and warm. Good fellowship prevailed.

There was much singing of songs; lusty voices raised to the nth degree to reach the high notes and to hold the harmony at the end. There was much banter, many jokes, and some stories were told.

SEVENTH BANQUET
MILK DEALERS BOTTLE EXCHANGE

The Seventh Annual Banquet of the Chicago Milk Dealers' Bottle Exchange.

Howard Greene, lively manager of the Brook Hill Farm certified acidophilus milk organization, pulled off his usual stunt to attract publicity. This "stunt" being nothing more than having himself loudly paged from the stage so that all in attendance might hear his name and see him in person. The stunt has been worked before and, needless to say, Howard was severely censured by Secretary R. E. Little of the International Association of Milk Dealers. It is hoped he will not try the stunt again, but we understand it is a habit of such long standing that its breakage will be well nigh impossible. Howard "got away with it" nicely, though he did hesitate a little too long in getting up.

The only speechifying was done by Judge Ernest C. Reniff, whose remarks occupied about 62 seconds and during which brief interval he paid tribute to the milk dealers, saying that their monuments would be the healthy faces and bodies of their surviving humans, made possible by the health-producing milk they are handling. Many who read this will recall that this is the same Judge who acts in that judicial fashion at the annual picnics held at Brook Hill Farm.

Though this was a Chicago affair, several of the milk dealers from Milwaukee were in attendance and they, together with the Chicago dealers who originally hailed from the Badger's habitat, joined in singing "On Wisconsin" so enthusiastically that we, a Badger strayed from his home lair, were momentarily overcome.

This little episode was counteracted, however, and no doubt fortunately, by the immediate singing of "Illinois" and we, having resided in the Sucker State l
enough to acquire the status of being in fact one,
again to go through the emotional strain of hearing
song of the Prairies sung with much gusto.

Who was Who, at the Banquet, would actually
a big book on milk dealers, so we shall mention c
Tom Palmer, who was passed about freely and wh
burnt offerings offered savory soothings. He was v
received and but few passed him by without accept
his hospitality.

The entertainment included songs and dances, st
telling, and a splendid lot of songs rendered most bea
fully by Chicago's Celebrated Police Octette.

HEALTH CHAMPIONS DRINK MILK.

By M. O. Maughan, Secretary, National Dairy Council.

Two young ladies and one young man were selected in December as being the healthiest children in Amercia. They were proclaimed the 1926 champions.

Health champions have been selected each year during the past several years at the time of the International Live Stock Show in Chicago.

These children are carefully examined and their health habits are noted and in practically all cases the children selected as champions are found to be strict observers of the rules of health, which call for the drinking of milk, eating of fruits and vegetables, the brushing of teeth and other fundamental rules.

Alberta Hoppe. Warren Greffin. Jeanette Rushing.

Two years ago, in 1924, the healthiest boy and girl each reported drinking a quart of milk a day, and a year ago, 1925, the same was reported on the part of the young man and the young lady who were selected as champions. However, in the contest held last December, covering the year 1926, an exception to this general practice was noted. Two young ladies tied for first place, each scoring 98.6 out of a possible 100 points. One of the young ladies drinks a quart of milk a day and observes the health habits, whereas the other young lady does not drink milk at all, observing, however, the other rules of health. She does not drink any tea or coffee, whatsoever.

The young man chosen champion for the year 1926 drinks two quarts of milk each day, and believes this is one reason why he was so successful in the contest in competition with the other boys and girls from every state in the Union.

There are approximately seven hundred thousand boys and girls who are members of the 4-H Boys' and Girls' Clubs, the health contest being one of the activities of these clubs.

No definite information has as yet been secured regarding the use of butter, ice cream and cheese, by young lady not drinking milk, but it is believed tha is a very liberal user of these products.

It is well known that exceptions occasionally o and this is one of those exceptions. As stated, all vious champions have been liberal users of milk an may expect that other champions to follow will be users of the "King" of all foods—MILK.

An interesting and most inspiring sight was rea when milk was drunk by every boy and girl who att ed the Boys' and Girls' Club banquet given at the man Hotel, and attended by approximately fifteen dred of these splendid young men and women. I had waited to see a large group where 100 per cent of t in attendance drank milk. This was a realizatio that hope.

May the movement spread rapidly.

MERGER OF FOUR MILK COMPANIES IN INDIANAPOLIS, INDIANA.

Capitol Dairies, Indianapolis, Ind., was incorpo on February 1st, with an authorized capital of app mately $1,000,000. This company is a consolidatio four of the largest and best known milk compani Indianapolis, namely the East End Milk Com Schaefer Bros. Inc., Ryan Bros., Inc., and the Wi Bros. Milk Company.

The organization of the new company was the r of long effort spent in investigating not only the p cability of consolidating a certain class of dairies in city, but also in ascertaining how many of the lea dairies in the country have succeeded in marketi superior product in the congested centers of popula

It was announced by the new company that a the best practices and equipment of the leading da of the United States are to be adopted by Ca Dairies, Inc., and that many improvements in service quality of the company's products already have bee cluded in the company's plans of improvements.

Lowell H. Wilson of that city, and vice-president general manager of the Indiana Condensed Milk pany, and a nationally known expert in the dairy i try, is the president of Capitol Dairies, Inc. Other of of the company are: George C. Forrey, Jr., preside the Fletcher American Company, vice-president; Th S. Hood, secretary of the Fletcher American Com secretary-treasurer. These officers, with Charles B. mers, Indianapolis capitalist, and John P. Collett, stitute the board of directors.

"We have approached the task of consolidating milk companies and of building up a new organizat Mr. Wilson said, "fully aware of our responsibili the householders of Indianapolis. Milk is a basic product and upon its quality rests in no small d the health of the community. For that reason we consolidated into this new company such dairies tha equipped and have been delivering an excellent q of milk to their customers. In organizing Capitol Da Inc., we did not strive for size, but for quality."

RECOMMEND STANDARD EXPORT BUTTER

The Western Ontario Dairymen's Association, held its annual convention at London, Ontario, Jan 13, 1927, passed a resolution that the adoption of a s ard export butter box, 12½ by 12½ inches, and enough to hold 56 pounds of unsalted butter, be re mended to the Canadian Dairy Commissioner, s Trade Commissioner Lynn W. Meekins in a report t Department of Commerce.

Fluid Milk Market Report for United States for Jan., 1927

By Bureau of Agricultural Economics, Market News Service, United States Department of Agriculture.

Table I—Producers' Prices for Standard Grade Milk Testing 3.5% Butterfat, Delivered F. O. B. Local Shipping Point or Country Plant.

Prices which appear in this report are secured through the co-operaton of milk distributors, producers' associations and municipal officers. Dealers' buying prices unless otherwise indicated, represent prices applying to all milk delivered by producers. For cities where a "surplus plan" is in effect, the prices reported in table III are for "basic" quantities. All per cwt. buying prices have been converted to a 3.5% butterfat basis for comparative purposes.

Sections	Range of January Prices		Prices Compared for Same Markets			
	Number Local Markets	Prices per Hundredweight	Number Local Markets	1927 Average for Jannary	1926 Average for December	1926 Average for Jannary
New England	9	$2.77–$3.82	9	$3.37	$3.47	$3.49
Middle Atlantic	15	2.55– 3.15	15	2.85	2.85	2.75

Leffel CREAMERY BOILERS

Save Time Labor Fuel

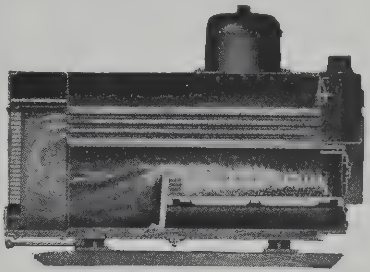
A tremendous saving in fuel costs at your plant, can be effected by using Leffel Creamery Boilers, because they get double service from every pound of coal used.

The hot gases are **compelled** to travel twice the length of the boiler through water surrounded passageways.

Even the ash pit is surrounded by water, thus utilizing every possible heat unit to produce steam.

Because of this highly efficient application of heat, owners save 30 to 50% in fuel costs.

In all sizes 6 to 150 H.P.—workmanship and quality guaranteed—will meet all state boiler laws.



Full description and prices on request.

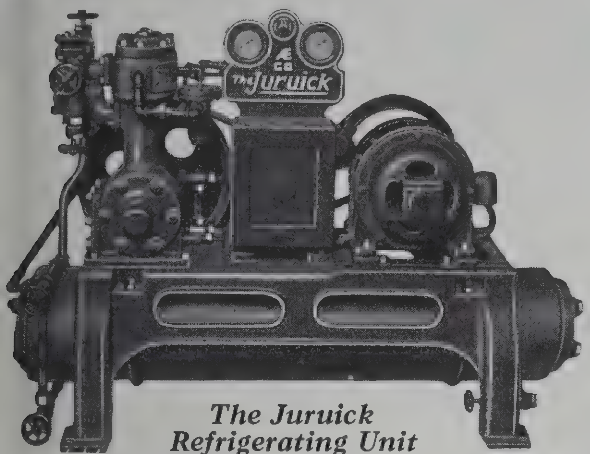
Juruick
REFRIGERATION



The Juruick Refrigerating Unit

Juruick Electric Refrigeration increases dairy profits because it is the surest, safest way to cool milk . . . . because it *automatically* maintains exactly the right temperature . . . . because it runs only when necessary to keep down the temperature . . . because it requires no attention.

Juruick Refrigeration is electric refrigeration at its best. "Just turn the switch."

GROUP INSURANCE FOR EMPLOYEES.

The Ann Arbor Dairy Company, Ann Arbor, Mich., has furnished its employees with group insurance protection under an arrangement with the Metropolitan Life Insurance Company, whereby the dairy company pays the entire cost of protection.

Establishing life insurance in excess of $45,000, the schedule provides each employee on the dairy payroll less than a year with $500 life insurance, while those with longer service are insured for $1,000 each.

In addition to creating death benefits for an employee's family or other dependents, the life insurance provides the employee himself, with a temporary fixed income if he becomes totally and permanently disabled before the age of 60. Should such a condition dev the full amount of his life insurance will be paid to in monthly installments.

In addition to paying the entire cost of the insur program the dairy company, through an arrange with the Metropolitan, offers the services of a tra visiting nurse to sick or disabled employees.

BUTTER ALMOST A LUXURY IN BRAZIL.

A short time ago the residents of Rio de Jan Brazil, paid as much as 15 milreis per kilogram, or a $1.02 per pound, for butter, the highest figure rep there in several years. The average price of butter t is about 5 milreis, or approximately $.65 per kilogra

Just What You Have Been Waiting For—

AN *Extensive and Authoritative* *Experiment with Children to Prove the Wonderful Value of Milk*

Up to the present time, practically all experiments to prove the value of milk have been conducted on animals, and it has been necessary to try to persuade the housewife that if milk made animals grow then it would make children grow. Now, however, information is available showing what milk actually does for children.

The Medical Research Council of London, conducted an experiment on 220 boys. Their findings are given in a popular way in this little six page folder—actual size shown here.

You can now secure these folders for your own use in any quantities desired. Your name can be imprinted on the back page if you wish at a slight additional cost ($1.50 per M; 10,000 or more $1.25 per M).

These valuable circulars suitable for enclosing with your monthly statements, for distribution through your driver-salesmen, and of great worth in many other ways, will cost only—

$5.00 per M for 1,000 to 10,000
4.50 per M for 10,000 or more

Your order will be filled promptly.

What Milk Did For 41 Boys

Experiments conducted by the Medical Research Council of London, England, prove the necessity of Milk in the diet of growing children.

Don't overlook this opportunity. Every customer and prospective customer should know of this wonderful experiment on children.

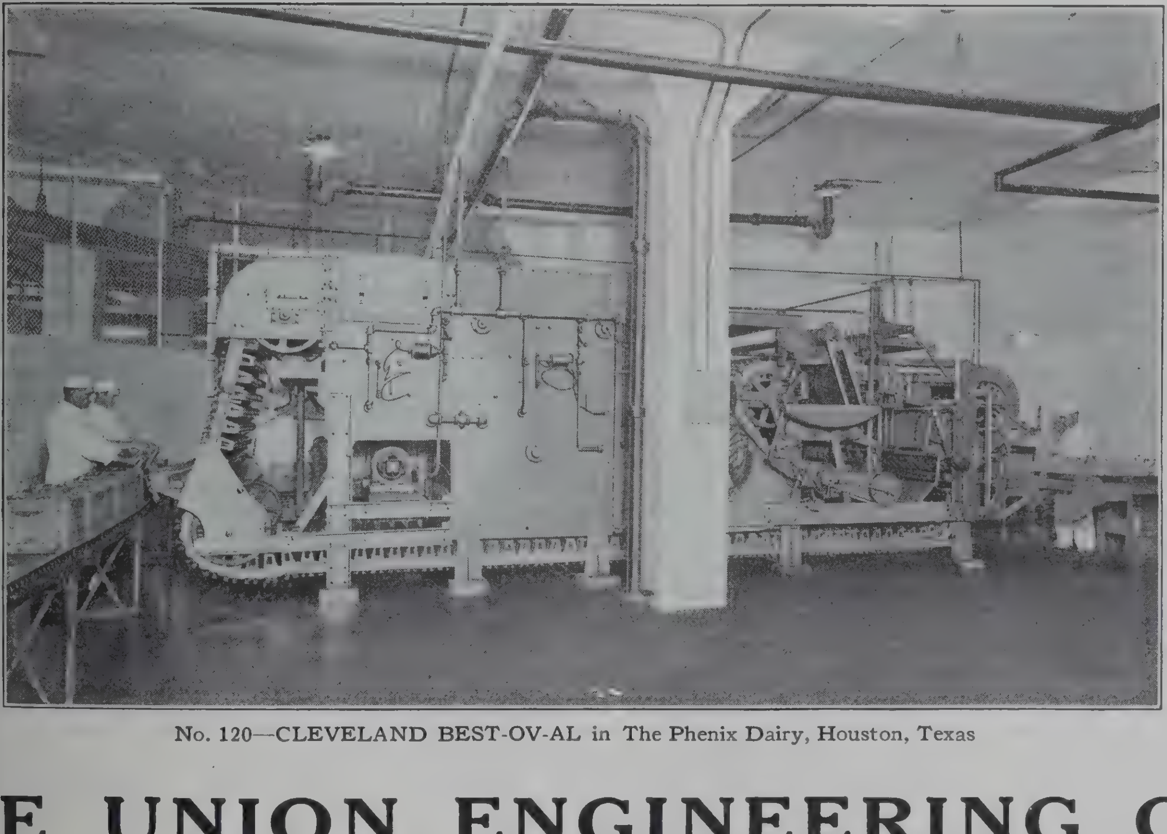
MORE PROOF!

of the SUPERIORITY of the

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**



Guaranteed Cleaning Efficiency 99 9/10%

THE INTERNATIONAL COST ACCOUNTING SYSTEM.

(Continued from page 27)

at the same time, reveals the elements of strength also. It is just as important to know the elements of strength in your business so that you may keep them alive, as it is to know the elements of weakness, which you should remove. If you don't pay any attention to the strong elements of your business, the chances are that they will be running along without recognition and there will be no bar to the entry of elements of weakness; even the strongest among us may become weak if we are not sufficiently nourished.

Profitable management is the goal of the executive. We all want to increase profits. The real and ultimate object of cost accounting is, therefore, to increase profits. I won't even say that negatively, and say that the object of a cost accounting system is to reduce costs. Of course that is true. But the object of a cost accounting system is more than to reduce costs. The object of a cost accounting system is to introduce into your industry, the best elements of control over your business, a more efficient management of your plant, of your distribution problems and of your entire business structure. Now, if cost accounting accomplishes all these things then one may say that the real object is to increase profits, because all of these efficiencies will increase production, will stop leaks and will lead to a better control of your personnel.

The greatest object of cost accounting is, therefore, profitable management. There are a lot of people who oppose cost accounting, and cost accounting systems. Who are they? I won't name individuals or classes. But I can say this—the opponents of cost accounting are the indolent, the inefficient, and the selfish. This indictment is applicable almost universally because it is generally one or more of these traits that always come to the fore when opposition to a cost system exists. Indolence and inertia, it seems to me, are the greatest opponents of progress. People like to say to themselves, "Well, we are getting along all right, why not leave good enough alone?" That is the kind of philosophy that has always stood in the way of progress. That is the kind of philosophy that made people satisfied to believe that the earth was flat and prevented them from accepting the truth even after it was discovered.

It is so much easier, isn't it, to go along the accepted channel, the accepted road, to simply go along the lines of least resistance. But there is no progress in that. The man that wants to build muscle, has got to struggle. He must fight against odds. The man that wants to develop himself at all, has got to overcome problems in which mental exercise is involved. The man that wants to succeed in business, is the man that is able to face all unusual situations in business and overcome them. And he cannot face those unusual situations in business, unless he fully arms himself to meet them as they come up.

I believe that one of the best weapons that you can use in the game of progress, is the weapon of knowledge. The weapon of knowledge, expressed in accounting, is just exactly what you people have developed in your own organization here—your uniform cost accounting system. That is the knowledge. Cost accounting is knowledge, and it is expressed in the language that you all understand. I am very glad that you developed this system by your own initiative, through your own conference and out of that co-operative spirit, which apparently is so strong in this organization. You are bound to succeed.

I think you should commend very strongly the work of your secretary, and the work that Mr. Bolitho has done in connection with this really monumental work for your association.

I have had occasion to look over the entire system for this organization, and for the ice cream manufact I have had occasion, I think, to look over some 5 uniform cost accounting systems, and I must say t have not seen any that is more complete, or that is expressive of the things which should be expressed, your own system. That is probably due to the fac you were not foolish enough to hire somebody from out your organization to do all of the work. The cost accounting systems are those that have been oped from within an organization.

I don't know what your association is doing a present time in order to spread this gospel of un cost accounting. I do not, therefore, care to mak recommendations, because, not knowing what yo doing, I might make recommendations which things that you are already doing. I have found one of the most successful methods of spreadin gospel of uniform cost accounting, is to have re meetings. Your organization is probably large e to have such regional gatherings of your cost g there to discuss problems of practice in particular ties.

All that I can say, in closing, is that you have life to an infant in your organization which you a dealers should know how to nourish. You must that infant filled with good milk and cream and sure, that if you do, much cream will find its wa your surplus account.

WHEN THE CREDIT CUSTOMER STALL

Nobody but a professional collector knows the a infinite number of "stalls" given by delinquen tomers. I am sure that the stalling customer, no how original, has no conception of the possible ex We in the collecting game get accustomed to them. are everyday matters. Let's list some of them. " get all about it." "I did not receive the bill." called to pay, but the clerk didn't know anything it." "My pay check was late this month." "I sick mother in the East, and have to support her. gave the money to my husband and he forgot t you." "I am saving money for a vacation, and so has to wait." "I have been sick and unable to down and pay." "I voted for the owner of the at election, and I think I'm entitled to a favor."

Added to these are many others. One woma me that, at a spiritualist meeting, a spirit told h to pay the bill — giving no reason. She was ca out orders!

Some stalls are sincere; others aren't. The enced collector becomes expert in instantly sizing excuse. What should the creditor do when he the customer is lying?

Almost never should he reveal his knowledge pose" the petty deceit.

Usually, I act just as though I believed every s the stalling customer is uttering. If only a minor was involved, and I feel there is no danger in the tion, I let the customer "get away" with the st concede.

At the same time, however, I arrive at a defin derstanding as to when the customer will pay. T the main thing—getting the money in a pleasant m

Of course, in a case of stall after stall, there is n but firmness to exercise. Sick uncle or not, the co must emphasize the imperative nature of the obli He won't reveal, usually, the fact he knows the is just that—not a legitimate fact and reason.

To most stalls be an appreciative listener— time figuring skillfully just how and when you wil your collection.

CLEAN MILK

Is Only Assured by Proper Filtering

WHO IS DRIVING YOUR MOTOR TRUCKS?

(Continued from page 28)

ceeding to the garage the truck struck and killed a pedestrian.

In this case, in holding the motor truck owner **not** liable it is important to observe that the court said:

"It will thus be seen that there is absolutely no evidence of any authority given to the chauffeur to depart from his assigned route to the garage from the store with his empty truck, for the purpose of taking a friend a mile to the north. Whatever argument might be given as to his authority to take fellow employees on his truck....there is no evidence which can be possibly held to authorize his departure from his route to take such employees to their homes far away from his path of duty. The taking aboard his truck and conveying to his home of another employee, under the circumstances shown here, must be held to constitute an abandonment of the employer's business and an engagement on a private and unauthorized undertaking of his own. For the results following such an undertaking the defendant (owner) is **not** liable."

In another case, Tyler vs. Stephans, (174 S. W. 790), the court explained the circumstances, in holding a motor vehicle owner **not** liable for damages, and said:

"Beyond the scope of his employment, a servant is as much a stranger to his master as a third person. In every such case the proper inquiry is, Was the servant engaged in serving his master? If the act be done while the servant is at liberty from the service and pursuing **his own needs exclusively, the master is not responsible.** * * In this case the uncontradicted proof shows that the chauffeur....had performed all the service that he was then required or expected to perform. * * Instead of following directions....and returning to the garage, he took the machine and set out on a journey that had no connection whatever with his master's business. * * The facts show that the chauffeur had no authority, either express or implied, and the trip was not taken for the purpose of furthering the business of the defendant (owner)."

In Cohen vs. City of New York, 213 N. Y. S. 710, decided within the past few weeks, it was disclosed that the owner of a vehicle was held **not** liable, because it was proved that a pedestrian was killed while the driver of the vehicle was in the act of driving more than 30 blocks out of the direct route to the garage, after being instructed to go directly there.

In still another case of Slowacky vs. Sheffield Farms Co., 134 Atl. 674, the Supreme Court of New Jersey handed down a decision in which a vehicle owner was held not liable for the death of a boy who was hire helper by the chauffeur against the orders of the

The facts of this case are that the driver was ex ly forbidden to hire anyone to help him in the disc of his duties, and, in addition, notices to that effec conspicuously posted at the place where the d called for their trucks.

The lower court rendered a verdict against the for $6,000 damages, but the higher court reverse decision and said:

"We are confronted with the unchallenged sit that the driver's act in that regard was unauth and in defiance of express orders of defendant (o not to engage in such practice, and, furthermore the defendant was unaware of the practice in dis ence of its express orders....An equal bar to rec is the undisputed fact that the plaintiff's decedent was running for the truck and was aware that i not slackening its speed but was going fast....nev less, he made the attempt to board it and succee obtaining a momentary foothold, when he either s or fell off through the ordinary movements o vehicle."

Thus it is evident that the owner of a vehicle liable in damages effected while a driver is acting a instructions.

On the other hand, the deviation from the instru must be material, or the employer is liable.

For instance, in the recent case, Fleischmann C Home, 280 S. W. 496, after the driver of a motor had completed a delivery....instead of going di to his employer's place of business, he deviated o block to go by his father's home to get some mone

While making this slight deviation he struck seriously injured a pedestrian.

The court held the employer liable for $1,610 ages, and said:

"It is the contention of the company that Sc (chauffeur) had abandoned the employment of the pany at the time of the accident, and was engaged trip entirely for his own benefit, and....says.... where the servant is engaged on business of his and is acting wholly outside of the scope of his em ment and on no business of his master, the master i responsible for the torts of the servant....There distinction in legal effect between a deviation an abandonment in these cases. If the chauffeur in t stant case had merely deviated from the most course, but had not **wholly** abandoned the business master, the master **is** liable. The question, therefor Did the chauffeur abandon the service of the mast merely deviate from it? The generally accepted as expressed in the many opinions of courts throu the country, makes the master liable for injuries inf by the chauffeur, where the departure from the ma business was but temporary, amounting to no more a deviation....The chauffeur in this case was m returning....by a route a block or two longer tha necessary, but he was on the way to the place o business of his master in pursuance of his dutie Under the facts and circumstances of this case, it w seem clear that the driver of the truck had merely ated from the direct course which would have led back to the place of business of his master to take a more circuitous route to the same place, but that i ing so he did not completely abandon, even for a mo the service of his master, and, not having done s acts were the acts of his master, and his master is for the injury."

Keeping Up the Quality of Milk Products

is very much a matter of keeping down the bacteria that cause Sour Milk, Ropy Milk, Low Score Butter, Odors, Mold, Stinky Cheese, etc. For surest and most successful control of bacteria—

These Savings Are Yours

with the LADEWIG-SOELCH SUPER-EIGHT BOTTLE WASHER

Saving No. 1

Simplicity is the keynote of this remarkable machine. Fewer parts in the general assembly and a great many less moving parts almost eliminate mechanical attention and any possibilities for replacements.

Saving No. 2

The entire machine is compactly built. It requires about one-third less floor space than any other machine of equal capacity. It saves floor space for small milk plants as well as the larger ones.

Saving No. 3

The hydraulic principle of washing is employed. The bottles are first pre-rinsed, then soaked by complete submersion and then pressure-washed inside and outside at the same time. No bottles need ever be sent through the washer the second time because of faulty washing.

Saving No. 4

This Ladewig-Soelch Super-Eight is a one-man machine. The clean bottles come out at the feed-in end. This eliminates one man from the pay roll.

Saving No. 5

Capacity is from 20 to 60 bottles per minute and can be regulated to any filler and capper. The height of the discharge end is the same height as that of the filler. No blocking up is necessary.

Saving No. 6

There are no working parts inside of the machine and every part on the outside is easily within reach. This means a big saving in time and labor. The entire machine is built low down and no ladders or steps are necessary. All moving parts are driven by a ¾ H. P. motor which is a further economy.

Saving No. 7

Perfect temperature control eliminates bottle breakage. This saving over a year's time represents a worth-while profit. No adjustments for various sizes of bottles are necessary. Half pints, pints and quarts can be run through together.

Saving No. 8

The Super-Eight sells for considerably less than other washers of equal capacity. Quality in materials and efficiency in design has been maintained throughout the entire machine, yet the first cost of a Super-Eight represents an important saving.

Attendance Records Fall at Jackson Meetin

Michigan Allied Dairy Association's State Convention Goes Over Beyond Expectations
Banner Meeting Held In Jackson, Michigan, On February 7 to 11 Inclusive

JACKSON, MICHIGAN, during the week beginning February 7th, extended hospitality to the Michigan Allied Dairy Association when it opened its forty-third annual convention and exhibit in the Administration Building at the Jackson fair grounds.

The convention continued for four days and brought to the city representatives of seven affiliated groups, as well as exhibits of numerous dairy products and of all kinds of machinery used in the milk industry.

The city of Jackson proved to be a royal entertainer, and a very cordial invitation was extended the association to make Jackson the permanent location of its show and convention.

Delegates to the convention were sincerely welcomed by Lewis Atherton, secretary of the Employer's Association of Jackson, and he spoke in behalf of the Chamber of Commerce. Mr. Atherton said he took great pleasure in welcoming the association to Jackson, and remarked that, judged by the good fellowship displayed, the delegates seemed to be glad to be in Jackson. He expressed his belief that such conventions are of great benefit to those in attendance as they assisted in advertising the communities from which they come.

Martin Seidel of Bay City, Mich., president of the association, made the response. He took occasion to thank the Chamber of Commerce for its co-operation in bringing the convention to the city and in working out in detail plans for the exhibit. He made especial mention of the work done by Bert Reed of the Fleming Ice Cream Company of Jackson, and president of the Michigan Association of Ice Cream Manufacturers.

Mr. Seidel emphasized the excellent accommodations provided by Jackson, saying the organization has never before had such a large and convenient exhibit hall placed at its service and he expressed the association's sincere gratefulness for this feature.

A fine display of exhibits brought to the hall during the week a larger attendance of dairy people from the state of Michigan than any previous convention of its kind has every brought. Up to Wednesday night, the attendance equalled the highest attendance ever produced at any other show in Michigan held by this association, and Thursday's and Friday's number of visitors registered brought the attendance mark past the highest ever attained. The exhibit hall was open from 8 a. m. until 6 p. m., with the exception of Thursday, when it remained open until 7 p. m.

The annual meeting of the Michigan Association of Ice Cream Manufacturers opened on the afternoon of February 9. Bert Reed of Jackson was again re-elected president; A. E. Williams, Saginaw, vice-president, and Ralph Sullivan, Battle Creek, secretary. The board of directors are: Nelson Dessert and H. A. MacDonald, Detroit; Roy McColgan, Saginaw; John Kelly, Grand Rapids; LeRoy Wilson, Port Huron; V. G. Piper, Kalamazoo; Homer Freeman, Flint, and Hilton Piper of Muskegon.

At the annual meeting of the butter unit, Charles Hack of Saginaw was elected president; Walter Brown, Alma, vice-president; C. H. Parker, Saginaw, treasurer. The following directors were elected: M. Seidel, Bay
City; H. A. Aberill, Ravenna; C. O. Tuttle and
Shedd, Detroit. Director at large, M. Seidel, Bay

The Michigan Allied Dairy Association banquet
held on February 9th, and was attended by a gathe
of 300 people, the banquet hall being crowded bey
capacity, and some could not be seated. A splendid
gram held the attention of the visitors from beginnin
end. The speaker of the evening was W. Russell Gr
advertising expert of Hires' Root Beer Company of
adelphia, and he chose for his subject, "The Rom
in Your Job."

Declaring the economic or business phase to be
most important in human existence today, Mr. G
ably discussed the romance in your job. He stated
there are two ways of looking at your job, one bein
regard it as a bread and butter proposition and the o
to see the romance in it and so achieve success. "
behind your job," the speaker said. "There is rom
in every man's job if he will but look for it. This
of coffee, for instance," the speaker paused and tu
his after-luncheon cup in his hands. "Back of this
of coffee are the people producing the coffee, growi
in Brazil, curing it and shipping it, the crews on b
the vessels bringing it to this country. Visualize
back of your cup of coffee and the drink becomes s
thing more than just a little stimulant."

"This piece of bread," holding a piece of ro
his hands, "was made from wheat flour that was gr
probably in Minneapolis, maybe here in this city.
wheat was grown in billowing fields, mile upon mi
fields in the northwest hard-wheat region. The sho
ing used by the baker, the sugar he employed, all
ingredients of this piece of bread have a romanc
them. The man who has made a success baking
most likely saw the romance back of a crust of bre

In discussing advertising methods and ways
means of building up a successful business, Mr. G
vividly pictured the triangle of business. He stated
the base of the triangle must be the product. Ma
worth while. Know that it is worth boosting. No am
of advertising will bring success to a company or
ness that does not have a real product as the basis o
activities.

Personnel is Important.

He further stated that one arm of the triangl
business is the personnel of the organization. "B
it up. You employers know what it means to have
proper sort of men on your payroll. Make it worth t
while. Seek to instill in them a pride in your busi
On the other side of the triangle I would put ser
Give the best of service to your customers. Let t
know that they are receiving your consideration in e
business deal—one of the biggest things that makes
the success of that little word, 'service.' And so m
are failing in that respect. The employer is failin
serve his employees; the employees fail to serve t
employers; and both are failing to take advantag
the opportunity to serve themselves and the public.

Mr. Green emphasized the fact that too many o
are looking for the soft snaps in the world, and
there is a dangerous doctrine slowly permeating Ame

ie doctrine that the ideal situation is the situation in ch one does not have to work.

Prof. Reed Speaks.

Prof. O. E. Reed of the Michigan State College also ressed the banquet audience and traced the gradual wth of the industry from its crude beginning to the e of major importance it now holds in the world. declared dairy supply houses had done much to hasten development of the work.

Reminiscences.

E. A. Haven of Bloomington, Mich., president of the ociation 20 years ago, called to mind many amusing dents and stages of dairying which have taken place he progress of the industry during the past 20 years. "History of Early Dairy Association" was enjoyed, especially by many of the old timers present.

Musical Program.

A splendid musical and specialty dance program was dered in between the speakers' time and this, as usual, s enjoyed by all. Bert Reed and his quartet singing e dear old numbers was especially enjoyed. Harry cDonald rendered "On the Road to Mandalay," and usual brought down the house.

The Boosters' Dance.

On Thursday night, the Michigan Dairy Boosters held ir annual dancing party and from 9 to 12, at the ex-it hall, several hundred people thoroughly enjoyed mselves tripping the light fantastic. A corsage bou-et was presented each lady present.

Credit Goes to Leaders.

The credit for this splendid meeting and convention due to the committees for the 1927 convention. The

program was carried through without a hitch from start to finish, and was acclaimed by one and all the best and largest Michigan Allied Dairy Association gathering ever held in history. The officers, Martin Seidel, president; Bert Reed, vice-president, and D. W. Shiel, secretary, are to be especially commended for their untiring efforts to make this meeting the success that it was.

The Michigan Dairy Boosters.

On Tuesday, February 8, the first of the branch sessions of the forty-third convention and exhibit of machinery and supplies of the Michigan Allied Dairy Association, was held when the Michigan Dairy Boosters' Association held its annual business meeting and banquet in the Hayes Hotel, Jackson, Mich.

The entertainment program in connection with the feast was a feature of the evening and was in charge of E. G. Weed of Jackson.

C. J. W. Smith, Detroit, for many years connected with the Creamery Package Company, and the secretary and treasurer of the Michigan Dairy Boosters, was presented with a Masonic ring in honor of his faithful fulfillment of that position, by the association Mr. Smith was unable to respond as he was so touched by the sentiment of his fellow club members in this display of appreciation of his services.

The banquet was attended by about 150 boosters.

It was suggested that Jackson be chosen for the next two years as the convention city of the Michigan Association, but an amendment made later changed this to one more year. A further meeting in March will be held to decide definitely upon the location of the 1928 meeting and exhibition.

The new officers are as follows: President, D. W. Shiel, Shiel Mfg. Co., Hillsdale, Mich.; vice-president, J. A. Wise Westerlin & Campbell Co., Detroit; secretary-treasurer, Verne Harris, Berney-Bond Glass Co., Detroit.

The six directors chosen were: Lester Sedine, Barber-Goodhue Co., Muskegon Heights, Mich.; C. J. W. Smith, Creamery Package Co., Detroit, Mich.; Claude Grove, J. W. Ladd Co., Hillsdale, Mich.; Mr. Conklin, J. B. Ford Co., Grand Rapids, Mich.; D. F. Brown, De Laval Separator Co., Columbus; E. G. Weed, Foote & Jenks, Jackson, Mich.

⁂

HOLT UNANIMOUSLY ELECTED PRESIDENT MILK PRODUCERS' ASSOCIATION.

At the annual meeting of the Milk Producers' Association of the entire Chicago district, which includes Kenosha county, held in Chicago, Ill., more than 400 delegates from milk producing districts of Illinois, Wisconsin and Indiana registered.

Frank T. Holt of Kenosha, Wis., was unanimously elected president of the association. W. J. Kittle of Crystal Lake, Ill., was elected as secretary. Other officers elected were: Eugene Wilson, Lake Villa, first vice-president; William F. Buhr, Lake Zurich, second vice-president; Robert Oman, Huntley, treasurer.

President Holt stated that he would start immediately upon a campaign to rebuild the organization to its former influence in the various communities where it is established.

R. B. Swift, a former president of the association and now a state senator in Illinois, and Frank McCarthy of Elgin, also a member of the Illinois legislature, made the chief addresses of the meeting. Both stressed the importance of co-operation.

alesville, Wis.—A plant is being erected here for the ufacture of buttermilk, according to announcement by Hyter.

THE SUPPLY HOUSE.

What house do you patronize when purchasing your plies?

Do you buy from wholesale drug, paper and hardware ses as well as from your dairy supply house?

Have you ever stopped to consider the advantages to in confining your patronage to the recognized dairy ply house? Probably not, for it has not been brought our attention in the right way.

The established dairy supply house is just as much a t of the dairy industry as you are. The recognized se is lending its support to **your** industry, and its rests are as closely allied with the industry as are rs. The dairy supply house is supporting your asso- ion and is keenly interested in its activities, for your ess means success in just the same proportion to the ry supply house with whom you are doing business.

When you buy from the drug, paper or wholesale dware house your money is going outside the dairy ustry. Those houses have no interest, aside from ting your order, in you, your association or the indus- as a whole. They will not support your association, ier financially or morally, for it means nothing to m—their interests are essentially bound up in the in- try with which they are associated.

Isn't it logical and fair that you should confine your ply purchases to the recognized dairy supply house, ich institution is interested in what you are doing and lerstands your problems? We believe it is.—Cherry cle.

ILK DEALERS TO CELEBRATE BIRTHDAY.

The next convention of the International Association Milk Dealers will be held in Columbus, Ohio, on Octo- 19, 20, 21, 22, 1927.

The Neil House will be convention headquarters.

The coming convention will be in the nature of a thday Party, the event marking the 20th birthday of International Association of Milk Dealers.

That means a specially prepared program and the t attendance in the history of the association.

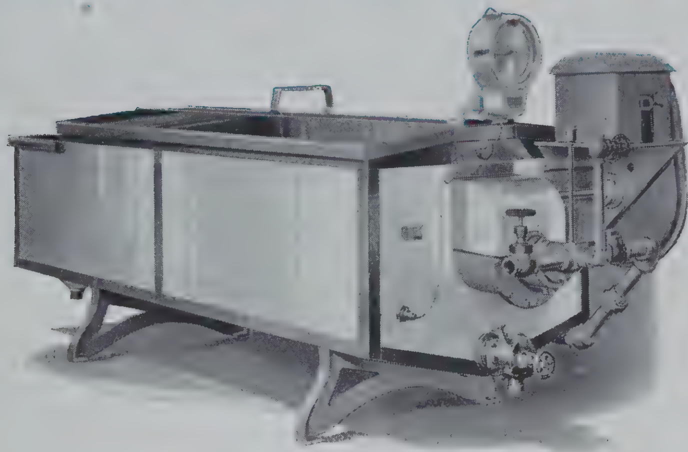
The Standard System of Pasteurizing Milk



We use the word "standard" in its dictionary meaning. Its value is fixed and certain. A census of the milk pasteurizing plants would doubtless show more of them using coil vat pasteurizers than any other system. There must be a good reason. There is. Coil vats fit the requirements of the growing business. It is a simple, flexible, efficient system.

The Wizard Pasteurizer is a standardized machine. It is kept up-to-date. Recent improvements meet the newer requirements squarely. The Wizard Safety Outlet Valve — a flush valve with leak detector and automatic sterilization — guarantees that no unpasteurized milk gets into the bottles.

Any standard Wizard, new or old, can be fitted with this new outlet valve at small expense. It is an example of the fact that an investment in Wizards is safe.

A new bulletin No. 1144 describes the Wizard and the Safety Outlet Valve. Send for a copy.

ARABIAN BRAND

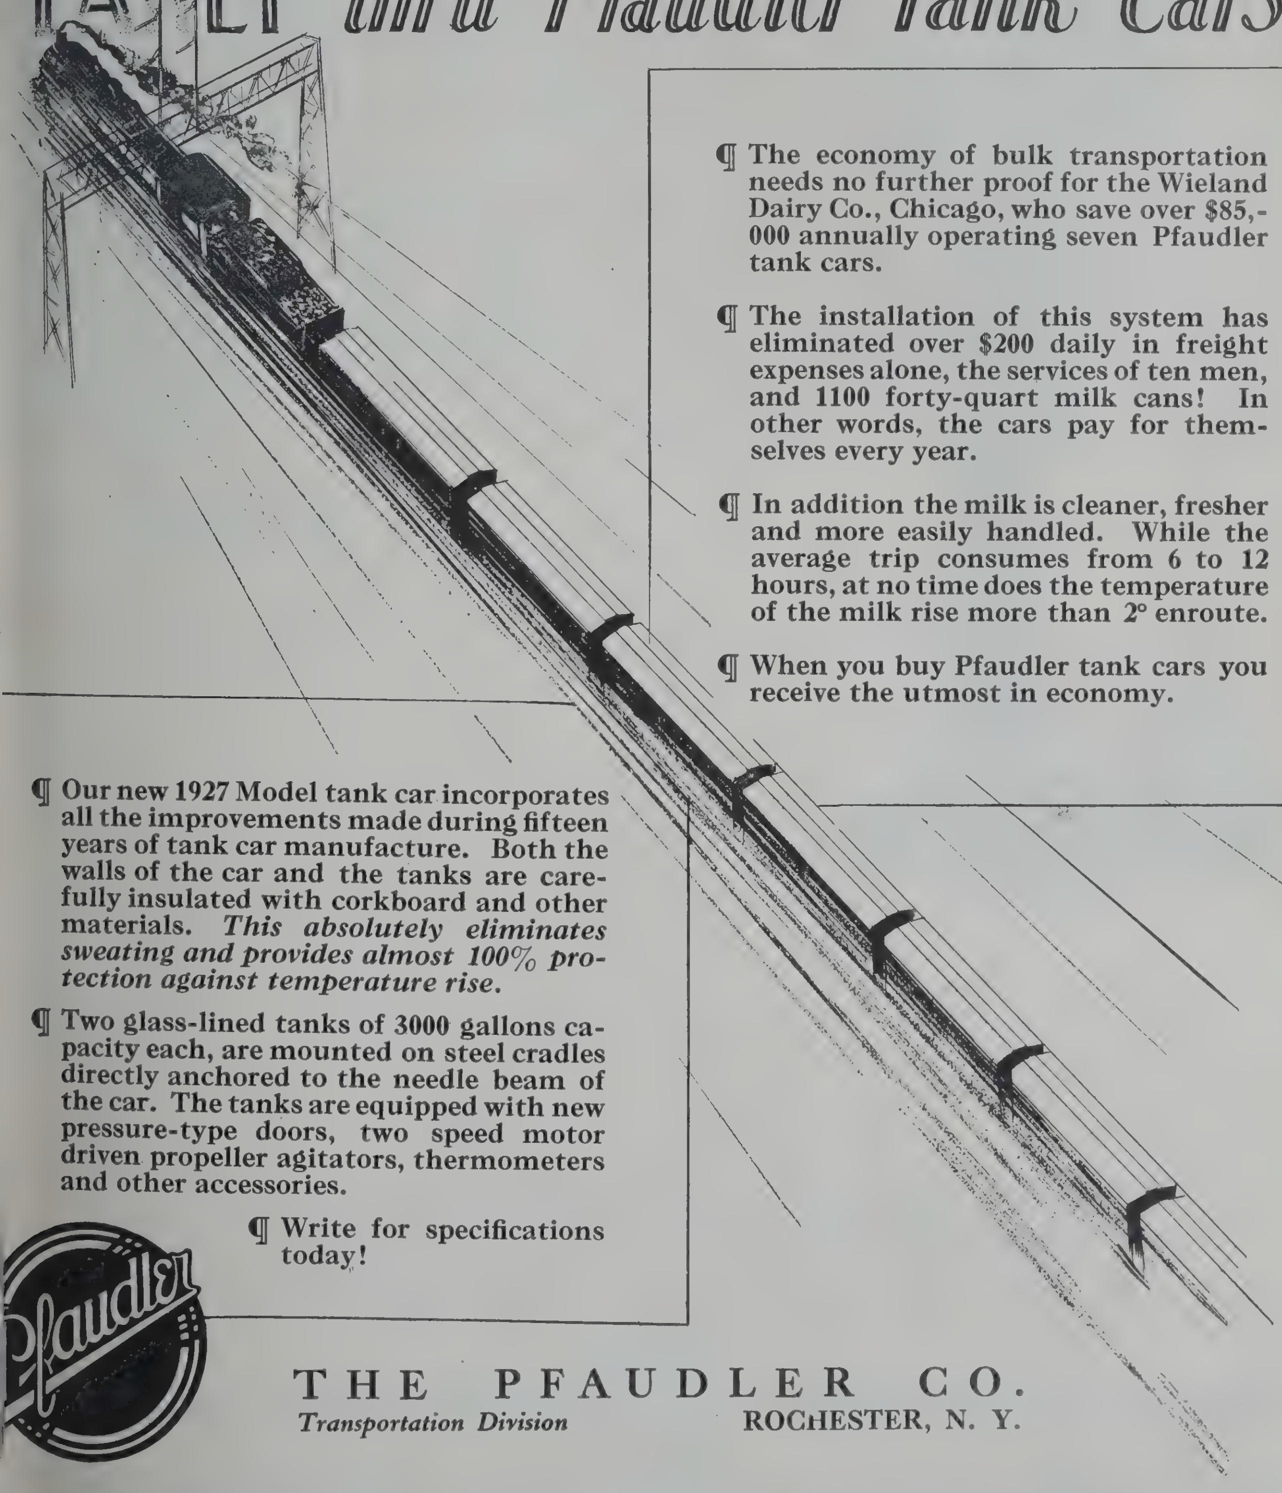
COFFEE SYRUP

Sold in 12 oz. and 16 oz. bottles for home use and in one gallon and ten gallon jugs for milk dealers.

HE WIELAND DAIRY CO. SAVE

$85,000

EARLY *thru Pfaudler Tank Cars!!*



¶ The economy of bulk transportation needs no further proof for the Wieland Dairy Co., Chicago, who save over $85,000 annually operating seven Pfaudler tank cars.

¶ The installation of this system has eliminated over $200 daily in freight expenses alone, the services of ten men, and 1100 forty-quart milk cans! In other words, the cars pay for themselves every year.

¶ In addition the milk is cleaner, fresher and more easily handled. While the average trip consumes from 6 to 12 hours, at no time does the temperature of the milk rise more than 2° enroute.

¶ When you buy Pfaudler tank cars you receive the utmost in economy.

¶ Our new 1927 Model tank car incorporates all the improvements made during fifteen years of tank car manufacture. Both the walls of the car and the tanks are carefully insulated with corkboard and other materials. *This absolutely eliminates sweating and provides almost 100% protection against temperature rise.*

¶ Two glass-lined tanks of 3000 gallons capacity each, are mounted on steel cradles directly anchored to the needle beam of the car. The tanks are equipped with new pressure-type doors, two speed motor driven propeller agitators, thermometers and other accessories.

¶ Write for specifications today!

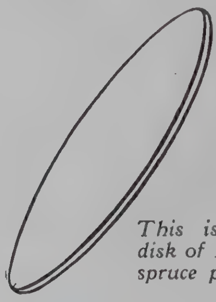
The AMF Hand Milk Bottle Sealing Machine.

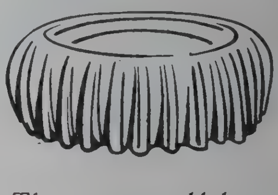
Seal *by hand*

THE Westlake one-piece, non-resealable Sanative Seal may be applied by means of this hand-power machine. The five-ply spruce paper disks are softened, moulded to a tight fit over the lip of the milk bottle, and cooled to shape in the hand machine just exactly as they are treated in the large automatic AMF Bottle Sealing Machine which was exhibited at the recent Dairy Industries Exposition at Detroit.

The resulting seal is the same as was demonstrated there—a completely protective, tight-fitting cover which guards the contents of the bottle against contamination. There are no wires or other equipment of any kind required to keep it in place. A simple turning and lifting movement enables the customer to remove the seal easily. It can then be replaced as a dust cover, but cannot be retightened and used again as a seal without instant detection.



This is the disk of 5-ply spruce paper.



The cap, moulded to shape from the disk, and covering the entire lip of the bottle.

Write for complete descriptive literature and prices.

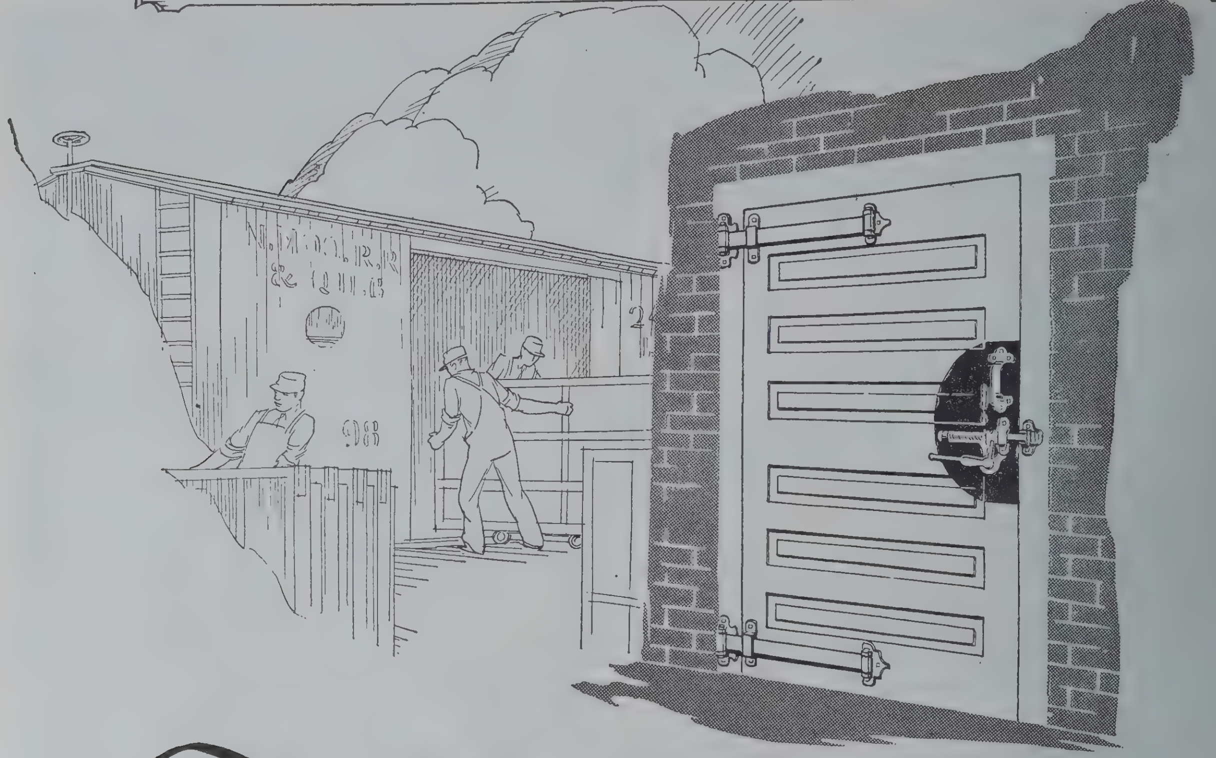
FACTS ABOUT COLD STORAGE DOORS ~ *No. 3 of a Series*



The Doors you need ~ *are ready to ship*

Jamison Doors
JAMISON COLD STORAGE DOOR CO

Send for new Jamison Catalog No. 13. Contains complete description of Cooler and Freezer Doors, Ice Chutes, and other cold room equipment. Also tables of "Standard Sizes."

GET your plant overhauled on time this year, by letting Jamison help you. No need to wait and wish for prompt deliveries of the cooler and freezer doors you require. No use risking being caught unprepared.

Order from Jamison, and you'll get your doors right on time. They'll leave our plant, not in a few days, a week, or a month—but immediately.

To meet the constantly growing demand for prompt shipments, we are carrying this year larger stocks of fully assembled doors than ever before.

Right now, our huge stock houses are full to the roof. We've planned ahead and operated our plant at full speed for months, to make up stock for the spring months, when plants everywhere are being overhauled. We are ready for any demands.

Check up your plant for needed replacements. Then wire or mail your door order to Jamison. You'll get your doors when you want them. Your plant will be ready on time.

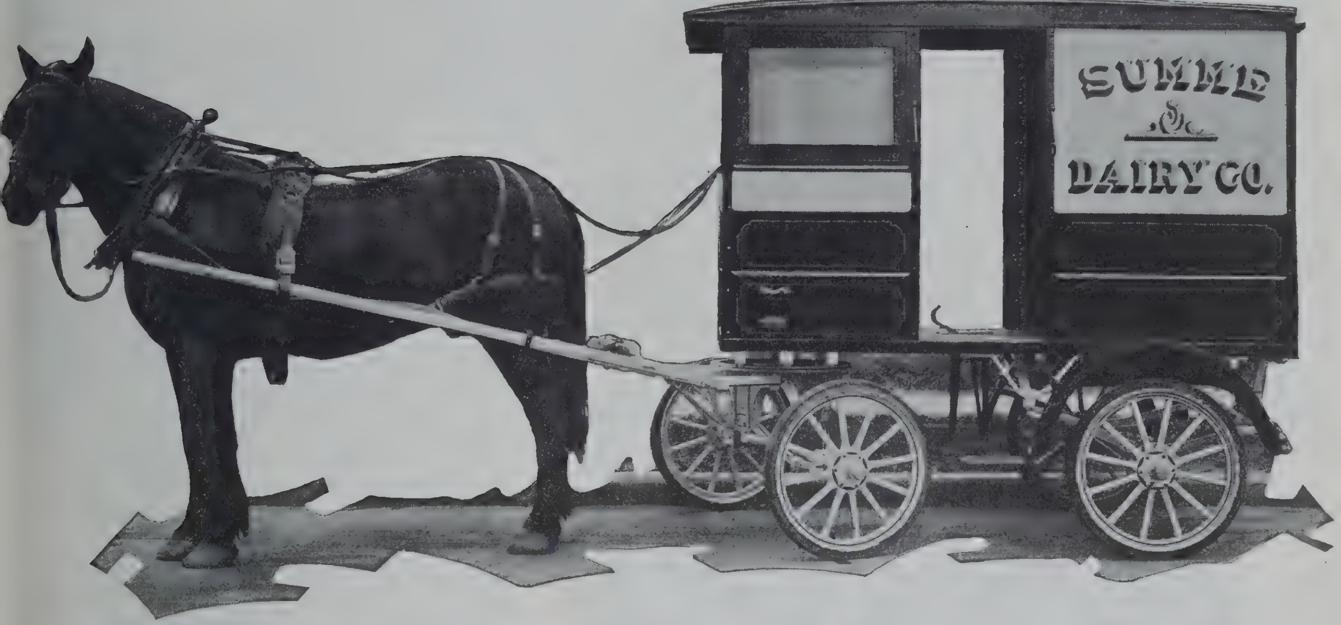
The HESSE AUTOWAGON

"The Modern Milk Wagon"



In 1500 lbs. Capacity—THE STRAIGHT SILL STYLE—or 2500 lbs. Capacity
24 CASES **Also made in the Drop Sill Style** **42 CASES**

o you realize that the only way the public—those who are your istomers and those whom you want as customers—has of judging our plant operations and the manner in which your business is onducted is by their daily contact with your delivery equipment?

Do YOUR wagons reflect the modern methods employed in your plant?
Do YOUR wagons reflect the up-to-date sanitary conditions in your plant?
Do YOUR wagons reflect the modern appearance of your plant?

ead what Mr. A. J. SUMME of the SUMME DAIRY of Kansas City thinks of HE HESSE AUTOWAGON

"Since putting the Hesse Autowagon in service nearly two years ago we have kept close tabulation of the results as com-red to our old style of equipment. We have found this wagon far superior in every respect. Our horses are much better king and easier kept. Our drivers have become salesmen and are much better satisfied because of the comfort of this low d easy riding wagon. And foremost of all, these up-to-date wagons have gained us much favorable publicity and confidence the public, reflecting as they do the up-to-date methods employed in our plant to give them A1 product and service.

We would not consider any other type of equipment."

SEND FOR FURTHER INFORMATION. WE'LL BE GLAD TO TALK THIS OVER WITH YOU.

POLK & SMITH STS.
HOUSTON, TEXAS

February 2, 1927.

Union Engineering Co.,
Cleveland, Ohio

Gentlemen:

Regarding the Bestoval Bottle Washer we purchased from you and installed in our new plant on November 7th,1926, wish to say that this machine is performing very satisfactorily in fact after a few minor adjustments when installed we have had no trouble with it.

The bottles discharged from it are sparkling and clear and we would heartily recommend this type machine to anyone in the market for a large size bottle washer.

Yours very truly,

MCO:K THE PHENIX DAIRY.

MORE PROOF

of the SUPERIORITY *of the*

CLEVELAN

BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after havi carefully studied all makes of bottle washers for more than thr years, decided on the **CLEVELAND** for his new plant, which is o of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressu and Dormant Soaking in Conjunction with Clean and Sterile Brush** would give him the cleanest and most sterile bottles to match his unexcelli product. Furthermore he knew that the Cleveland Bottle Washer was t machine for service due to its rugged construction and simplified design a this has been conclusively proven by the fact that **The Phenix Dai erected and put their bottle washer into operation themselves wit out the assistance of any representative of the Union Engineering C**

The Cleveland Bottle Washers are Built in All Sizes and for Every Requirement!

p's Motors Are All Wet

TRADITION
PROGRESS

'Look, Lad—

here's something I've found out—we've een too blamed careless in the plant by let- ng steam and water slosh around. Here I t a report this morning that three motors ropped out of service this week, due *abso- tely* to damp conditions. You'll have to find *me* way to get rid of all this dampness. It's sting us too much for repairs."

"No, Pop—

it's easier, cheaper, quicker, surer and better to get rid of the motors.

Let them die and don't repair them—*replace them.*

You've seen the picture of the Linc-Weld motor actually running under water.

Now look at why this is possible. (Of course it's due primarily to a super-insulation, but more about that later.)

Don't you see how, in your motor, the insulation doesn't even come up TO the slots?

Then on the Linc-Weld see how it goes clear INTO the slots.

No wires are exposed at all—so no dampness can get in.

Isn't that better than trying to put through an 18th Amendment in an attempt to make our process DRY? The cost of enforcement is too high and the results:? ?

Better get a motor that can take it or leave it alone."

The Lincoln Electric Co., Dept. 25-3, Cleveland, Ohio

HERE IT IS--*At Last*

Just What You Have Been Waiting For—

AN Extensive and Authoritative Experiment with Children to Prove the Wonderful Value of Milk

Up to the present time, practically all experiments to prove the value of milk have been conducted on animals, and it has been necessary to try to persuade the housewife that if milk made animals grow then it would make children grow. Now, however, information is available showing what milk actually does for **children**.

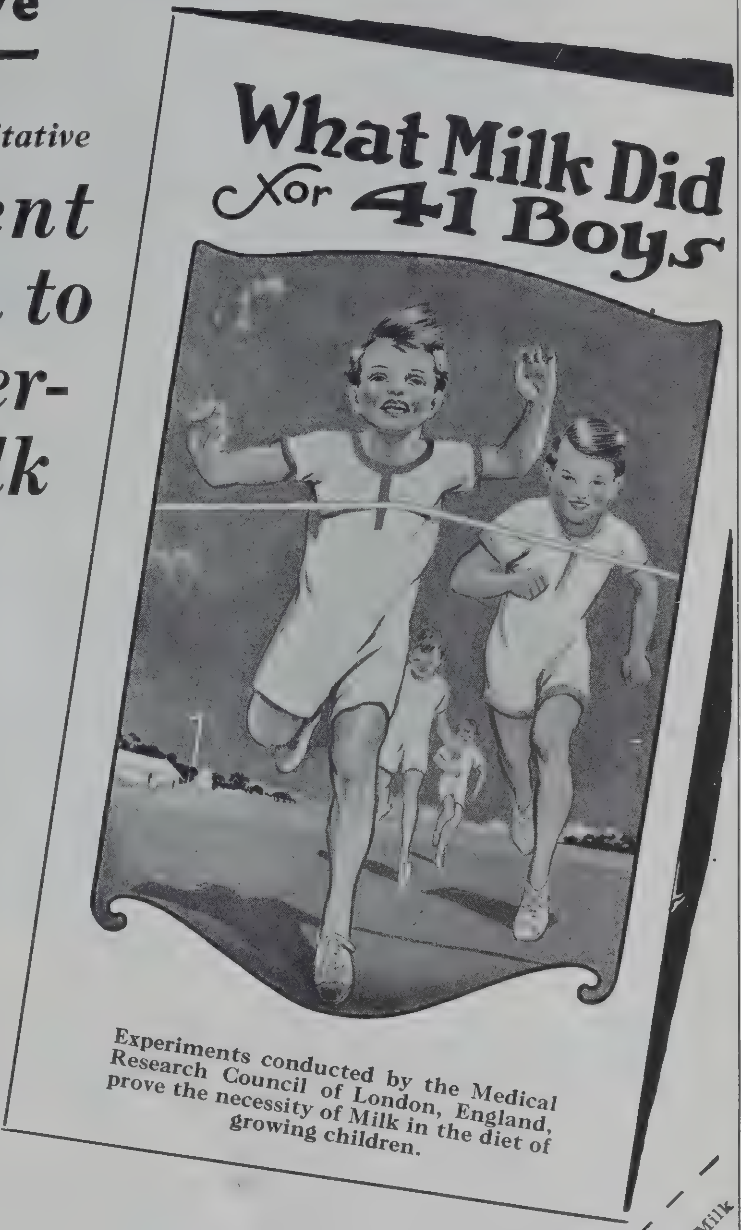
The Medical Research Council of London, conducted an experiment on 220 boys. Their findings are given in a popular way in this little six page folder—actual size shown here.

You can now secure these folders for your own use in any quantities desired. Your name can be imprinted on the back page if you wish at a slight additional cost ($1.50 per M; 10,000 or more $1.25 per M).

These valuable circulars suitable for enclosing with your monthly statements, for distribution through your driver-salesmen, and of great worth in many other ways, will cost only—

$5.00 per M for 1,000 to 10,000
4.50 per M for 10,000 or more

Your order will be filled promptly.



What Milk Did For 41 Boys

Experiments conducted by the Medical Research Council of London, England, prove the necessity of Milk in the diet of growing children.

Don't overlook this opportunity. Every customer and prospective customer should know of this wonderful experiment on children.

Lipman
AUTOMATIC REFRIGERATION

For Steady Dependable Service

For steady dependable service there's nothing like a Lipman. They're made to keep right on running. Lipman Full-Automatic Refrigerating Machines are built with brains, and backed by a manufacturing experience as long as the industry is old. Lipmans are tested and proven. They give *excess* service, the kind that asks no quarter, takes a minimum of attention and costs less to run than seems right.

For the details, write us to send you our Free Illustrated Folders. Do it now and you'll get them sooner — and the serviceable facts they contain.

"When the surface of the copper is covered by tin practically all of the objections against copper are fully met"

PROFESSOR HARDING *on* TINNED COPPER

In a recent issue of his "Bulletin" to milk plants, Prof. H. A. Harding of the Frederick C. Mathews Company, has revised a number of his views on the use of tinned copper in connection with the pasteurization of milk. The article is a long one, but we quote from the summary as follows:

"Tinned copper is the basis of the larger part of our present dairy equipment, particularly where the transfer of heat is concerned.

"Copper is admirably adapted to heat transfer, but along with this it has a marked tendency to form milk stone and casein deposit, largely through the co-agulation of the albumin of the milk."

(NOTE—Where Cherry Coil Pasteurizers are involved this does not apply as one of the most outstanding features of Cherry Coil Pasteurizers is their freedom from casein deposit.)

Prof. Harding continues: "Copper is constantly present in milk as it comes from the cow. It is likewise present in practically all our vegetable foods. Consequently the fear which is sometimes expressed that the copper from the milk may accumulate in the body, eventually producing undesirable results, is probably without adequate foundation in the case of milk.

"Under some conditions sufficient copper may be present to reduce the Vitamin C in the milk, but evidence is lacking as to how frequently and to what extent this actually occurs.

"When the surface of the copper is covered by tin, practically all of the objections raised against copper are fully met. Measurements are lacking from which to conclude as to the amount of copper which may become exposed in various types of apparatus before retinning is desirable.

"There seems to be nothing either in practical experience or in technical data which should lead us to abandon the use of tinned copper for sweet milk utensils until *some other metal* is shown to have even more desirable qualities."

View of Miller-Hydro at the Roseland Dairy, Chicago, Ill.

The Great Step Forward in Bottle Cleaning Methods

IN every large dairy the Miller Hydro will save several thousand dollars in salaries alone during the first year of its operation. It will completely eliminate bottle breakage and wastage even in handling an output of 2500 cases a day.

Figure what these savings will amount to in your own plant. Then consider along with the savings that over 3500 dairies, breweries and bottling plants of enormous capacity have pronounced the Miller Hydrostatic way of sterilizing bottles superior to any brush washing method that has ever been devised.

You can do away entirely with brush contamination, broken bottles and expensive replacements by installing a Miller Hydro. No other bottle washing machine made can equal its performance. It will pay for itself in your plant before you make the last payment.

Let us show you the many advantages of sanitation and economy that the Miller Hydro holds for you. Write today for complete information and list of large users.

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

MARCH, 1927

BULLETIN *of* EVENTS

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.

American Dairy Science Association—Annual meeting to be held at the Michigan State College, East Lansing, on June 22, 23 and 24, 1927. Secretary-treasurer, G. C. White, Storrs, Conn.

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive.

International Association of Milk Dealers—Twentieth annual convention to be held in Columbus, O., on October 19, 20, 21 and 22, 1927. The Neil House will be convention headquarters. Secretary, R. E. Little, 139 N. Clark St., Chicago.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

WHILE driving to the office one morning recently we encountered seven milk wagons within that many blocks. The snow was deep and it was difficult driving. All the drivers of these wagons were busy delivering milk while their patient horses kept the exact center of the street. As we passed or met each one we had to take to the deep snow. Of course, we reverently lifted our hat as we did so, but we wonder what the automobile driver, who has no more reverence for a milk wagon than for a coal truck, thinks or says under the same circumstances?

◆

IT DOESN'T take a smart business man to pick a fight with a competitor. The smart fellow pays no attention to the competitor who is spoiling for a fight. He uses all his energies and capital to build up his business.

SOME men in the milk distributing business are n ly collecting and delivering milk. They collect it the farm, bottle it and deliver it to the consumer. T buying problems and delivery problems take up all time and effort. They don't have any time left to milk. Plant problems, under which may be include of the thousand and one details that call for atten must be attended to. Everything else can wait, an problem of selling milk is one of these. The cust gives his or her order for milk and the amount is s low as actual need will allow.

The lady of the house plans on how little milk can get along with instead of how much she can p ably use. The result is just as low a gallonage fo dealer as his customers can possibly make it. We made the statement before in these columns that selling problem is the biggest one confronting the distributor, and yet it is the one given the least a tion by many men in the business. Even when ma these men give attention to sales, they think onl terms of customers. To them doing more business m taking on more customers. Inducing their custome use more milk doesn't seem to enter into their c lations.

We all know that the average city milk consum getting wonderful value when he buys a bottle of but the consumer doesn't know it, at least not to extent that he should.

◆

ON ANOTHER page we discuss the results of cent survey covering cottage cheese manufa and sales. The fact stands out that too many milk tributors make and sell cottage cheese just because feel that they are forced to do so.

Cottage cheese is a valuable food product. It dairy product and the ideal way of getting it int homes of consumers is to leave it there along wit day's supply of milk and other milk products.

Which prompts us to say again that the city mil tributor enjoys a distinct advantage over most business men that he often fails to take advantag His agent makes daily calls at the homes of his tomers. How many other business men have su contact with their customers? Not even the groce cause he goes only when he is called.

Successful business men believe in advertising. spend big sums of money to get their sales messages the hands of their customers and prospective custo When they resort to direct mail advertising they pay mailing and postage costs.

On the other hand the milk distributor has d contact with his trade and yet he fails to take adva of it as he might. Of course, this is not true with They are getting their sales messages into the h but the number that are doing so to the profitable are indeed few and far between.

ODERN machinery and improved methods in the milk distributing industry have just about revo- onized it, making market milk a safe, dependable cle of merchandise, but it is still impossible for a er to sell high grade milk unless he buys high le milk from the men who produce it. In other ds quality starts on the farm, and the milk distribu- who forgets that fact is on the wrong track.

The job of producing milk, as it is produced on the age farm, is not an easy task. The farmer earns y cent he gets. He puts in long hours and, in many s, does not have sufficient capital to properly handle business. He works so hard for so little net profit he often feels that he is not getting credit for what- effort he makes to improve the quality of the milk ells.

The milk distributor who starts out to get better milk p against a real job. His easiest refuge, of course, e law. He can, in most cases, force the farmer to better methods, but that doesn't improve the situa- as it might be improved.

Milk distributors in some sections have proven that possible to get the co-operaton of their producers in r efforts to improve quality. Farmers will listen to on in spite of the claims of some folks to the con- y. They can be made to understand that when the er can sell better milk they will profit along with

t's a mistake for the dealer to take the position that s not concerned with the farmer's problems. The inspector can accomplish just so much; the rest t be done by the dealer.

⁂

EN in the business who have given the subject careful thought are of the opinion that losses due arelessness in extending credit and in making col- ons are responsible for the bad way in which the distributing business finds itself in some parts of country. In some places profits are entirely wiped on account of bad accounts and the cost of collecting 1. While few are ready to say that the milk dis- iting business is prepared to go upon a strictly cash s, the majority are of the belief that the time is and when business should be very largely on a cash s and the opinion is virtually unanimous that what it is extended must be done very carefully. It is a ity poor policy to take business away from the other w on the basis of freely giving credit, and then lose our profits and some of your capital besides.

⁂

MILK plant can at least be clean. Some dealers make the mistake of getting so busy that they n't time to keep the plant looking attractive. ple like to associate milk and its products with abso- cleanliness. They may not be able to appreciate y of the things you do to make your plant efficient, they can appreciate cleanly conditions. Cleanly, active appearances accelerate the consumer's appe- for milk. The reverse is also true.

SOME men in business seem to be afraid to give free rein to the boyish impulses which lie more or less dormant in all red-blooded men. They seem to be afraid that their dignity is going to suffer. We believe such men are unduly and unnecessarily cautious. They are missing a lot of good things of life and gaining nothing in return. Somehow or other we just cannot get close to the fellow who can spend all day at a picnic and never get his hair mussed up. We may respect his dignity but we pity him. We notice right in this milk business that when the really big men in the business get together they have a lot of fun besides talking over serious business problems. There are always a few, of course, who stand around the edges, afraid to risk their dignity, out they don't seem to get very far, either in having a good time or in gaining the recognition as real leaders. It's a mistake to be afraid to play when it is time to play.

⁂

THERE is no line of business where outside appearances count for more than in the milk distributing business and in this connection the appearance of the inside of the plant comes under the head of "outside appearances," for it is the impression that people from the outside get of your plant, both within and without, that counts. If any place in your plant needs painting you can't economize by putting off the expense; if your delivery trucks need working over, nothing is to be gained by waiting; if your windows need washing—well, of course, one should never wait for that to happen Cleanliness not only is next to Godliness but it's mighty good business—especially in the milk business.

⁂

THE constructive work that has been carried on by the International Association of Milk Dealers, looking toward better business methods in the plants of its members, is having widespread influence. It is reaching far beyond the confines of the milk distributing industry. Men in other lines of business associated with the dairy industry are influenced by it. Others entirely apart from the dairy business are talking about it. This shows what a real trade organization can do, not only for its members, but for business in general. We wish there were more of them in the dairy industry like the International Association of Milk Dealers.

⁂

THE magnitude of the milk dealer's job is better understood when we search out comparative figures. In weight there is more milk consumed in a large city than flour, bread being the nearest to milk in volume of weight, after which follows sugar, of which every inhabitant consumes about 90 pounds a year. Other important food products are potatoes, onions, spinach and grapefruit. The weight of the milk consumed being greater than any of these.

⁂

SOME milk dealers talk knowingly of their "sales" department when, as a matter of fact, they have none. What they are talking about is their delivery department.

Special Displays For Milk Exhibits

New Department Created by the National Dairy Council to Assist Milk Dealers in Putting on Displays at Fairs, Etc.

WITH the establishing of a department in the National Dairy Council organization for the handling of special displays and exhibits the council is equipped to supply dealers' and producers' organizations throughout the country with a non-profit service, combining art and education in displays for health shows, conventions, fairs, milk windows and other exhibitions.

Under the direction of a trained art director, Chas. E. Sommer, the dairy council has established a special studio and work shop in its Chicago office where plans are outlined and exhibits created. Special displays showing the food value of milk, butter, ice cream and other dairy products in their relationship in the diet will be featured.

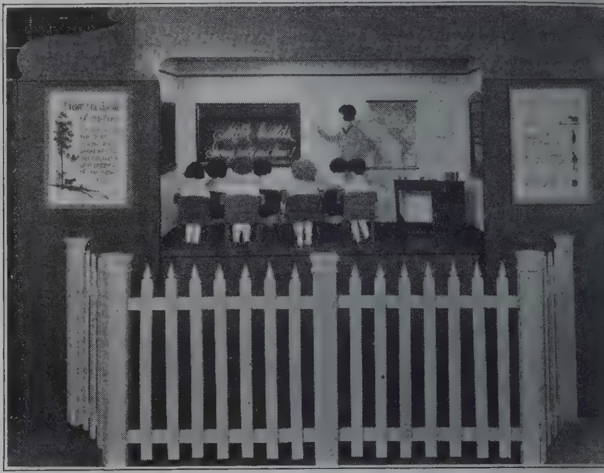
A display to be most effective in the view of the dairy council's exhibit department must be attractive enough to be seen by the public; it must command attention sufficient to be read; it must be convincing enough to be believed and it must be forceful enough to create action. With this basic policy of displays created by the dairy council, it will combine the educational and artistic characteristics with which to make them of the most value to the dairy industry.

Through this new service the dairy council is making available the scientific knowledge of foods in a practical manner for the entire dairy industry. During recent years the council has been called upon frequently to arrange special exhibits for educational conventions and during the past year many dealers have requested these exhibits for local use. The new department is the result of a demand for a nation-wide service which would make these educational displays available for the entire dairy industry on a cost basis.

Dairymen who are planning to use definite space in a food show or convention are urged to make use of the facilities of the dairy council organization. In cases where the shows are planned months in advance and the amount of space to be used in the exhibit is known, the council will be in position to arrange special displays to meet particular requirements.

For example, if a dealer writes to the National Dairy Council, 910 S. Michigan Ave., Chicago, stating the size of space which he wishes to fill and the type of audi
that he wants to interest, the dairy council can selec
material, posters, bulletin boards, or mechanical de
operated by electricity, in an artistic display and
send the dealer a complete layout with his mate
This will make it possible for a dealer at very little
than the cost of the material to rent or purchase a
ished display which can be set up by following the d
tions, requiring no specially trained person.

One corner of the studio and work shop where Dairy Council displays are planned and built by trained artists.



Educational exhibit created and built by the new displa
department of the National Dairy Council, showing typi
cal schoolroom studying Dairy Council literature.

$1,201,979.49 in surplus account. A contingent lial
of $141,364.33 for notes receivable discounted al
listed.

CITY MAY HAVE TWO GRADES OF MILK

As a result of a meeting held in Tiffin, O., by
dairymen, together with the city board of health,
grades of milk may be sold in that city.

The two grades of milk suggested are: Pasteu
milk, and Grade A whole or raw milk produced e
sively from regularly inspected dairies.

The exclusion of all milk except pasteurized
was urged by representatives of the two larger d
serving the local retail trade while the proprieto
the smaller dairies favored the admittance of Gra
whole milk as well as pasteurized milk.

Selling the Quality Idea to Readers

How Certain Milk Dealers Use the Local Newspapers to Emphasize the High Quality of Their Products

OCAL certified milk tests, as well as general city inspection tests, provide excellent advertising material for those dairies fortunate to win high hon- Consider Adohr Creamery Company, Los Angeles, example.

Of 22 certified milk contests, held by the Los Angeles Health Department since 1918, Adohr has won 18. wonderful record—and wonderful advertising ma- al.

The newspaper reader may think of the one-time ner of contests that merely good fortune has attend- t. Of a single concern winning 18 contests out of however, no such surmise can be conjectured. It es nothing to believe but a remarkable uniformity xtraordinary excellence.

Adohr Creamery Company uses display advertising apitalize its victories. A sample advertisement was columns by ten inches. Lettered in heavy black he top was, "Adohr Wins Again!" There was a e reproduced bottle—the wording set out very clear- upon it. Text told how in the most recent contest, hr Guernsey certified milk had won with a score of per cent. It was explained that the award was ed on surprise samples, picked during the six months n January to July.

There is a twin idea associated with high quality in x which, for advertising purposes, clever advertisers quently turn to. Why should quality milk be pur- sed—milk with which extraordinary pains have been en to insure purity? One of the big reasons, in thou- ds of cases, is the baby, or small child, who will con- e the milk. Appeal to safety enters.

Abbotts Alderney Dairies, Inc., of Philadelphia, and er cities, featured the safety thought in a heading, n followed with the quality idea.

The space unit was three columns by ten inches. A e panel, oval with modifications in shape, occupied upper half of the advertisement, in center. On seven s in this, heavy black type, was the heading, "You not buy Safer Milk for Your Children at any price!" A mother was shown with nursing bottle in hand, koning to a wee tot running with outstretched hands ard her. The copy, quoted below, combined both ty and quality thoughts.

At the advertisement foot was a signature of Ab- ts "A" milk. One feature of this was a sketch show- a woman, with microscope, examining a test tube. slogan was given, too: "Tuberculin Tested Milk eguarded by Science."

Mutual Creamery Company of Salt Lake City, ad- tising, reproduced the complete milk samples report a single month. The list was put in bold faced type, the head of a three columns by sixteen-inch adver- ment. Bringing out the high standard of Mutual amery Company milk, the name, fats and solids per- tages, and bacterial count were placed in bold face e of a larger point than that of other distributors. In body type below the superior standing of the npany's product was pointed out.

Purity arguments in dairy products advertising di- e into two classes—general and specific.

An excellent illustration of the specific, full-of-facts e comes from Des Moines, Ia., employed by the Flynn ry Company.

A sample advertisement is three columns by fifteen inches. The title is, "Laboratory Tests Insure the Purity of Flynn Quality Ice Cream." Two illustrating halftones are a distinctive feature.

One of these, at the top, has the explanatory caption, "View of one of the six units in our complete bacteriological laboratory—the only one maintained as an integral part of an ice cream plant in the state of Iowa." This half-tone was approximately three inches by four inches. At the advertisement foot was a second halftone, showing a laboratory worker engaged in tests. Explained the caption, "Another of the big units of our complete bacteriological laboratory, which absolutely assures healthfulness in Flynn quality ice cream."

Advertisement text, while brief, concentrated on the single theme. "The cream used in Flynn quality ice cream," it was said, "was tested in our complete bacteriological laboratory for every element affecting purity and health. It comes to you abounding in Nature's own richness, high in food value, while especially appealing to the palate with the delectable flavor of pure fruit juices and extracts.

"Try Flynn quality ice cream and you will say it is the smoothest, finest you have ever tasted."

The photographs, of course, were the heavy material of the presentation. While the advertisement did not go into detail concerning them, the reader was interested. The impulse to examine the photographs closely was stimulated. They made concrete, specific, the "laboratory tests" appeal. What was a laboratory, anyway? The question was answered for the reader the instant it came.

Incidentally, this advertisement illustrated a very effective border plan. Surrounding the text was a border approximately three-fourths of an inch in width, which was, except for inside and outside narrow rules, wholly black. Against this appeared, up and down the side, many white milk bottles. These were about one and one-fourth inches high. Across top and foot were dishes of ice cream. Within a large circle in the center of the topmost border was presented a charming child's face. Large reverse plate circles at bottom corners, featured, reverse plate style, effectively a carton of ice cream and a brick.

Specific stuff commands a premium in advertising to get quality and purity across. General statements have been overworked by practically all advertisers. They are trite in their sound, too. A sophisticated public is skeptical of them.

An advertiser can trot out a general statement claiming splendid quality. Only the dairy with the goods can talk of specific things constituting proof.

All this dictates that quality advertisers able to give the specific facts do so. And analysis will usually show that such specific information exists and can be transferred, with real effectiveness, to the printed page.

⁂

FOOTBALL PLAYERS DRINK MILK DAILY.

According to Football Coach George Gauthier, of Ohio Wesleyan College, he has prescribed the drinking of a quart of milk a day to his sixty players.

Gas Coupe Aids in Selling Milk

Wider Territory Covered and Outlets Increased Thereby. Keeping Personal Contact With Your Customers

By E. J. CLARY*

IN ORDER to increase their outlets, and extend their territories, many Eastern milk dealers are experimenting with the gasoline coupe, sending out their salesmen to open up quantity users of milk in the retail, hotel and restaurant and institutional trade, and in addition to selling, giving a frequent and valuable contact with customers which is of the greatest value.

In some instances, the domestic field is being covered in this way by men especially qualified to create good will toward the plant and its product.

These salesmen have proved their ability to pay their way and to accomplish a great deal more than the route man can accomplish, whose working hours are better spent in servicing the plant's accounts.

I have at hand some interesting figures on the cost of such a selling organization for the milk dealer which may number as many units as the business justifies.

One milk salesman, working for a New England plant, averaged 45 calls a day covering 50 miles and the cost of the operation to the milk dealer per car proved to be $3.25 per day.

It is further claimed that the cost per call on the commercial milk trade is nine cents per call within a mileage cost of ten cents. Considering the value of this kind of co-operative contact, the gasoline coupe would seem to be a good investment for the milk dealer especially where a large commercial business is done in a widely scattered territory.

In a great many instances where the plant has no regular selling force, this plan may appeal as combining as it does a good will proposition with an active selling one. Transportation, either because of its slowness when public conveyances are concerned, or through its cost when horse drawn vehicles are concerned, has had much to do to reduce the employment of salesmen working exclusively on sales and good will in the trade.

Good for Commercial Business.

While ordinarily, plant managers feel that domestic trade with its small sales units and the high cost per call, scarcely warrants a flying sales corps of this kind, though in territories which are thickly populated as in the larger cities, even that field will warrant frequent calls on the part of trained men who understand what the plant has to offer.

It requires surprisingly few mobile men when the gasoline coupe is concerned to contact the customers of even the large metropolitan plants, 50 calls a day meaning that a plant with 1,000 outlets in the commercial field can depend upon a contact about once each month even though only a single coupe is in service. By doubling the number, a call can be made twice a month which does much to offset the inroads of competition.

One trouble the small city plant experiences is the distance from its customers, not in the matter of mileage but in the infrequent and spasmodic personal contacts only that it is possible to secure. Where the tr has undertaken the employment of special salesmen this type, transport becomes the all important point asmuch as the number of calls per day is the key to situation.

That route men need to be checked up at interval pretty well agreed upon. The product of the indus must be sold as all products consumed by the pub must be sold and in addition to creating new outl the salesman using a gas coupe is able to keep the plan customers satisfied, settle complaints and create a feel of good will that might otherwise be lacking to the c pany's disadvantage.

But the management of any plant will wish to tablish the profits direct or indirect that may result fr investment of money in a gas coupe and a salesman use it before entering into any such plan.

What May Be Expected.

Figures show that in one instance, the result o six months' effort was as follows on a single gas cou

COST OF OPERATING COUPE SIX MONTHS.

Depreciation of vehicle	$120.00	
Insurance, taxes, etc.	36.00

Salesman's salary	1200.00	
	$1511.00	$1511
This is for six months—or, at the rate of about $3,000 a year.		
Now for the results:		
Gross of new business opened up in commercial field	14,000.00	
Estimate of value of good will through contracts on customers.	5,000.00	
	$19,000.00	$19,000

This is getting business at the rate of about ten cent which is not a high selling cost, volume consider

It is not probable that all salesmen could produc gross volume of business so large as a result of the fi six months, for the total for the year would run arou $30,000, though a portion of it must be estimated in form of good will created which is indirectly getti business.

The plant may feel that the addition of a selling c of ten per cent to its present high delivery costs a the estimates for selling costs through present chann is too much but when it is considered that this is bu ness building the matter takes on a new meaning.

It is almost indispensable that the modern plant gage in some such form of selling especially in th fields where purchase for resale or service utility and consumption is concerned. Outlying retailers, hot restaurants and soda fountains trade must be watch with increasing care and there is no method of keepi watch better than by the employment of high grade ict men able to make frequent calls with intelligent ment of customers.

---

* Merchandising consultant.

Delivery a Separate Matter.

ny such sales force equipped with gasoline coupes d be divorced from the delivery service of the plant he route man freed from any responsibility in this ect. Two men in small cars can do all the selling e commercial field that the plant having 1,000 out- requires.

he result of such a plan is also found in the im- ement of delivery service under such circumstances. ne plant manager in Boston told me that the service render showed a decided improvement among their rtant customers when they contacted them by s of special representatives using street cars, buses even taxis but the transportation costs proved too and the average number of calls daily too few to ant the expense. This plant is now trying out the gasoline coupe and keeping track of costs and results. So far they are satisfactory.

Selling cost must come out of gross and to increase the selling cost in the trade is often fraught with danger—results may justify every dollar spent and this is true of almost any business where service enters into costs as an important matter.

If the plant can find a way to reduce the selling costs below ten per cent as a result of this gasoline coupe idea, the thing will have to be done by getting bigger sales volume and keeping the salesmen up on their toes at all times. Otherwise, ten per cent might be a serious drain on the revenue of the plant.

The disgruntled customer in the trade often never gets a chance to air his complaints to the management and undoubtedly a lot of business is lost through having no adequate provision to maintain and build up good will. Route men are not prone to report conditions as they exist when trouble brews and this inside track on the situation furnished by the man in the coupe is offered as one solution.

More Cities Require Safe Milk

Results of Survey Conducted by Officials of the United States Department of Agriculture Indicate Growing Interest in Ridding Dairy Herds of Tuberculosis

XTENSIVE interest of cities in the nationwide campaign against tuberculosis of livestock is seen in results of a survey recently conducted by the ed States Department of Agriculture. A total of 874 and towns have ordinances requiring the tuberculin ig of cattle furnishing milk for consumption. Offi- reports indicate that with the exception of about er cent the ordinances are fairly well enforced.

he action of such cities as Chicago, Cleveland, De- and Louisville in promulgating tuberculin-test re- ments has stimulated recent interest in this subject. survey showed, however, that the smaller communi- also are fully as active in safeguarding their milk lies.

addition to the 874 cities having tuberculin-test ances, 375 provide an option between tuberculin ig and pasteurization. Thus a total of 1,249 munici- es have taken positive steps to safeguard their milk lies from possibility of disease transmission.

ourteen states also have enacted laws or have issued ations authorized by law requiring the tuberculin ig of cattle. Though varying in details, the laws the same general purpose—to safeguard the whole- ness of milk supplies. In all cases tuberculin tests be applied by approved graduate veterinarians.

s a basis for skilled tuberculin testing in which the c may have confidence, the federal and state veteri- officials have prepared lists of "accredited" and roved" veterinarians. These terms apply to private itioners who have satisfied federal and state authori- s to their qualifications.

n examination of the forms of supervision over the culin testing of cattle supplying cities with milk s the large extent to which cities have accepted the lled uniform plan of testing. This plan provides al and state indemnities for cattle which prove to iberculous and which are removed from the herd slaughtered. The plan is followed by 634 cities. s that rely on municipal inspection alone number 498, while 117 other cities and towns use a combination of the two safeguards or make some other provision for tuberculin testing.

A study of reports from the various states explains the rather general adoption of pasteurization as an additional safeguard even when the cattle are tuberculin tested. Proper pasteurization, as is well known, destroys any infection from other disease-producing organisms that may be present. It also gives double assurance that no living tubercle bacilli are present.

Some states, of which Florida is a typical example, receive large quantities of milk from other states. Florida does not have a statewide tuberculin-testing law, but the city of Miami, for instance, requires pasteurization in addition to tuberculin testing. Much other milk received in the state is also pasteurized since its origin, outside of the state, is beyond the jurisdiction of local inspectors. In several small towns tuberculin testing of cattle is conducted in response to a demand of patrons, though no official ordinance requires such tests.

These sidelights appear to show the strength of public opinion and the extent to which milk consumers demand safety with respect to their milk supplies. The condition appears to be especially true in states to which tourists and home seekers go for their health.

Several states have issued educational literature dealing with bovine tuberculosis, the evidence of transmission to human beings, plans for eradication, and laws and regulations for suppressing the disease.

Besides this means of stimulating interest in safe milk supplies, various state officials have drafted sample milk ordinances based on successful ordinances elsewhere. In these are embodied effective and practical provisions for dealing with the tuberculosis problem.

Some cities have taken more definite action than others, but evidence is abundant that city "fathers" are becoming more and more concerned in guarding the milk consumed in their communities.

Net Profit or No Profit

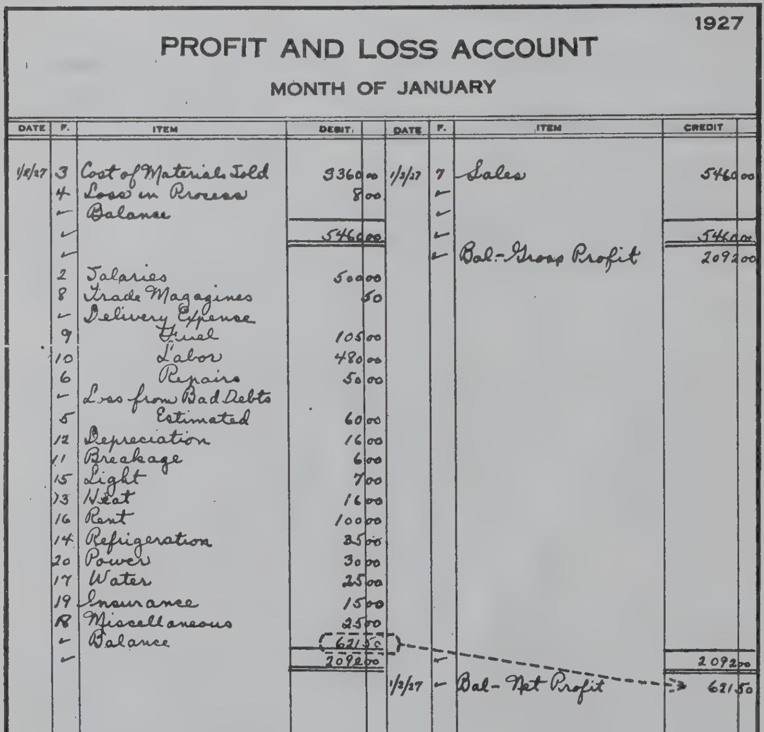
A Few Accounting Suggestions for Handling Costs in the Small Dairy

By F. M. BRUGLER*

THE purpose of any business enterprise is in the last analysis that of making a profit, and a knowledge of costs is indispensable to that purpose. No matter what the size of the business, cost is the impartial and common denominator. Each business has its individual fraction to solve, and the old junk collector may have a relatively larger margin of profit than the United States Steel Corporation.

The small dairyman who has from 500 to 1,000 customers is in business to make a profit. His accounting problems, however, lack the detail which confronts the larger distributor and, owing to their apparent simplicity may, as a result, not receive the attention they deserve.

His accounts are less numerous; the products he distributes are less varied; but the main principles of cost and their relation to net profit are quite as significant as to the operator who serves 10,000 or more customers. The small dairyman has just as much right to stretch his feathers over the margin of profit he obtains, provided his system of accounting gives him a true story of past performance. A system which tells the dairyman the whole truth is based on an intelligent handling of costs.



1927

PROFIT AND LOSS ACCOUNT

MONTH OF JANUARY

DATE	F.	ITEM	DEBIT	DATE	F.	ITEM	CREDIT
1/2/27	3	Cost of Material Sold	3360 00	1/3/27	7	Sales	5460 00
	4	Loss in Process	8 00		✓		
	✓	Balance			✓

	✓	Balance	621 50				
	✓		2092 00		✓		2092 00
				1/3/27	✓	Bal.-Net Profit	621 50

The above is a suggested profit and loss form for the small dairy operator. By carefully observing the principles outlined in this article, the small dairy plant should be able to establish an accounting system which will extract a true evaluation of net profit from the tangle of the month's transactions. It is to be emphasized that the dollar figures given above are entirely hypothetical, and are not presented as financial standards.

The Two General Divisions of Cost.

Cost may be broken down into two general divisions which follow the line of a product's advance from raw material through fabrication and on to the consu
Cost finds first expression in the amount of money w
is paid for raw material and is to be designated as "
terial cost."

The conversion of raw material and the distribu
of that product to the consumer have costs which
to be included under "manufacturing and distribu
cost." The above classification is by no means stand
rather, it is resorted to for the purpose of simplicit
explanation and with an eye to the particular circ
stances of the small dairyman.

When material cost (price paid the farmer for w
milk) is deducted from total sales, the resulting
represents a definite evaluation of spread, which ter
used to designate the relation between material cost
selling price. In order to simplify subsequent expl
tion, this item will be called "gross profit." Under r
refined accounting methods, gross profit has a bro
application, but in this article the term will be used
in its application as defined above.

In order to obtain a true gross profit, the da
man must receive daily the amount of whole
received from the various sources and keep an
curate record from day to day of accounts re
able and cash receipts. It is the better part of
dom to enter the above items daily on record
convenient form, summarizing them monthly.

Not Approximately, But Exactly.

A check should be kept on the amount of
lost through leakage and spillage, with the thou
of eliminating this condition as much as poss
The dairyman should know exactly the numbe
pounds of milk which he receives daily, chec
this against the number of pounds which go to
customers. The difference between the pounds
ceived and the pounds ready for distribution g
the amount of loss during process. A notatio
such loss at various intervals may throw just
suspicion on equipment or labor.

The step from material to manufacturing
distribution cost marks a transition from simpli
to complexity. A varied array of items fall u
the latter, and it is a dangerous likelihood
many will be neglected when the cost roll is ca
at the close of the month. It is indeed a fictit
net profit to be pocketed when manufacturing
distributing costs are accounted for only in part
The composition of such cost is presented in the
lowing general divisions:

1—Administrative Expenses.

Under this heading falls cost of directing the busi
such as: salary of proprietor and assistants, trade m
zines subscribed to, and trade association fees. All i
of labor in the dairy would fall in this division, fo
small dairyman can generally handle the work invo
by adding to his own efforts those of an assistant or

2—Sales Expense.

Under this head fall expenses which result from ssity of directly distributing the product from the y to the consumer, such as, delivery expense and loss n bad debts.

---

* Credit department, The Pfaudler Co., Rochester, N. Y.

3—Depreciation and Breakage.

The gradual depreciation of machinery and equipt, the breakage of bottles, and the continual wear on very equipment are just as much items of cost as are erials purchased. By recording such costs from th to month, and charging them to the current opion of the business where they should be allocated—burden of replacement is considerably lightened. The s for charging depreciation on the various types of hinery and equipment is a matter of the dairyman's erience and judgment in addition to estimates of the of the various units which make up the dairy equipt.

4—Overhead.

Under this head fall all other expenses which cannot placed in any of the above three divisions, such as: t, heat, rent, refrigeration, power, water, and insure.

When the expenses included under the above four dings have been deducted from gross profit, a true re for net profit is obtained. The items listed are of f concern; the values under debit and credit are ed at random in order to complete the illustration.

TEL CLEVELAND FOR MACHINERY AND SUPPLIES HEADQUARTERS.

The hotel headquarters of the Dairy and Ice Cream chinery and Supplies Association throughout the od of its second inclusive Dairy Industries Exposi—which will occur in the $6,000,000 Cleveland PubHall and connecting new large West Annex, October o 29, inclusive,—will be the modern Hotel Cleveland ch stands at one corner of the famous Cleveland lic Square. From the Hotel Cleveland the Public l is reached by a brief walk.

The National Association of Ice Cream Manufacturannounced not long ago that its headquarters for the iod of its annual convention in Cleveland, October to 27, inclusive, will be the Hotel Hollenden, ch is even nearer to the Public Hall than the Hotel veland.

Other Cleveland hotels which, the association annces, can be recommended to dairy industries visitors exhibitors are:

Statler, Winton, Olmsted, Colonial, Fern Hall, New nsterdam, Murphy's, Alcazar, Allerton, Bolton are, Devon Hall, Fenway Hall, Park Lane Villa and stlake.

INTRODUCE MILK IN SCHOOLS IN SCOTLAND.

The Scottish Board of Health has inquired of the nmittee on physical instruction and health of the nburgh education authority regarding an investiga into the nutritive value of milk for school children.

It was proposed in Edinburgh to have four groups of y or sixty children between 8 and 9 years of age, to om certain quantities of milk and biscuits would be plied during school hours, for a period of about eight nths. Records showing the gain in height and weight these children would be taken under the supervision a woman medical officer appointed by the Scottish rd of Health who would provide the funds for the intigation. The proposition was met with approval by educational authority of Edinburgh, provided the sent of the parents would be first obtained.

JUDGING CONTESTS FEATURE CALIFORNIA MEETING.

The annual meeting of the California Dairy Industries' Association was held at the University Farm, Davis, February 17, on the last day of the dairy industry short course. The following were elected officers for the year 1927: H. E. Torgerson, Dairy Products Laboratory, San Francisco, president; I. N. Voorhees, Knudson Creamery, Los Angeles, vice-president; C. A. Phillips, University of California, Davis, secretary-treasurer. The executive committee (members at large) are: L. R. Quinn, San Pedro Creamery, San Pedro; Ella M. Peterson, Dairy Products Laboratory, San Francisco, and E. A. Stevens, United Creamery Association, Arcata.

Competitive judging contests in market milk, butter, cheese and ice cream were held in connection with the meeting. The following were announced as winners:

MARKET MILK.

1. H. Davies, Mountain View Dairy, Long Beach.
2. R. Farr, Brookside Dairy, Redlands.
3. F. Vogelsang, O. J. Weber Co., Los Angeles.
4. C. Robertson, Los Angeles County, Santa Maria.
5. L. R. Quinn, San Pedro Creamery, San Pedro.

BUTTER.

1. J. J. Foley, Maid of California Cry. Co., Vallejo.
2. E. Barlow, United Creamery Assoc., Arcata.
3. E. A. Stevens, United Creamery Assoc., Arcata.
4. L. R. Quinn, San Pedro Creamery, San Pedro.
5. G. Lallemand, Frasier Valley Milk Prod. Assn., Sardis, B. C.

CHEESE.

1. A. H. Boies, San Fernando.
2. R. Farr, Brookside Dairy, Redlands.
3. E. Biles, State Inspector, Stockton.
4. F. Kopp, Golden State Milk Products Co., San Francisco.
5. C. L. Cairns, U. F. Creamery, Davis.

ICE CREAM.

1. G. Lallemand, Frasier Valley Milk Producers' Assoc., Sardis, B. C.
2. E. A. Stevens, United Creamery Assoc., Arcata.
3. P. Manny, Riverdale Creamery, San Francisco.
4. J. L. Cooksley, Geo. Hass Co., San Francisco.
5. F. Harrild, Sacramento.

SWEEPSTAKES TROPHY.

Ross Farr, Brookside Dairy, Redlands.

The prizes which were awarded at the annual banquet were donated by The California Milk Distributors' Association, California and Southwestern States Ice Cream Manufacturers' Association, California Creamery Operators' Association, California Cheese Association, Taylor Instrument Companies, Geo. W. Prising Company, Creamery Package Manufacturing Company, Western Confectioner, Pacific Dairy Review, The Olsen Publishing Company, and the J. B. Ford Co.

Annual subscriptions to the Olsen publications were awarded as follows as prizes:

Harry Davies, Mountain View Dairy, Inc., Long Beach, Calif.: One year's subscription to "The Milk Dealer."

J. J. Foley, Maid of California Creamery Co., Vallejo, Calif.: One year's subscription to the "Butter, Cheese & Egg Journal."

E. F. Boies, 142 Hubbard Ave., San Fernando, Cal.: One year's subscription to the "Butter, Cheese & Egg Journal."

Geo. Lallemand, Frasier Valley Milk Producers' Assn., Sardis, B. C.: One year's subscription to "The Ice Cream Review."

290,000,000 POUNDS OF WHOLE MILK REQUIRED TO PRODUCE MILK CHOCOLATE CONSUMED.

According to figures issued by the Department of Agriculture, Washington, more than 290,000,000 pounds of whole milk were used in manufacturing milk chocolate, the consumption of which has increased tremendously in the United States during the past few years.

Trade Associations and New Competitio

The Weapons of the New Competition. Co-operative Advertising Is One of the Greatest of These

By O. H. CHENEY*

GENTLEMEN, at the outset I wish to assure you that I have come here on a mission of peace and good-will. Before I have finished talking you may rise up in wrath and smite the man sitting next to you with your soup spoon. You may think that he is your friend and has been your friend in this Forum for several years. I shall disillusion you. He is your deadly enemy—at this very moment he has plans which, if they were really successful would ruin the industry you represent and thus leave you without a job. He is your secret enemy—so secret that he doesn't know it himself. No, the man sitting next to you "don't mean you no good," as they say of the villain in the melodrama—and I wouldn't blame you if you hurled yourself at him with blood in your eye.

How It Happened

In Chicago there is a splendid organization, known as the Chicago Business Secretaries Forum. It is just what its name implies. Secretaries of trade associations make up its membership. R. E. Little, secretary of the International Association of Milk Dealers, is president of the Forum. In commenting on Mr. Cheney's address, Mr. Little said: "Mr. Cheney's address is a very liberal contribution to the literature of trade association work, and to the effectiveness of the work of the trade associations represented in this Forum."

We are giving it space in full and commend it to the careful attention of every reader of The Milk Dealer.

But I am here on a mission of peace and good-will. Please spare the man at your side until you hear all. There may be others in this room who are even worse enemies. When I am finished you may think that a free-for-all fight is the only sane action to take.

Perhaps you represent the proprietory medicine industry. The man next to you may represent the rubber industry—and there is a bitter feud between you because one is trying to keep the feet of the people dry so they won't catch cold while the other is making his living by curing colds. Perhaps, however, you represent the lumber industry. On your right is the secretary of the brick association, on your left the executive of the cement association and over there are representatives of the hollow-tile trade and the cut stone industry. Which of you is going to beat the others in supplying materials for this years's new homes?

Do you represent the millinery trades? The man at your side may serve the fur industry, and by promoting the style of big fur collars on women's coats he is ruining the hat business by forcing women to wear small and inexpensive hats. You may be interested in the ankles of the fair sex—I mean, you may represent the silk hosiery industry. You have two brave rivals who are ready to fight to the death—to spend millions in the fight—for the glory of those ankles—the leather industry, which has suffered from the low shoe vogue, and the fabrics manufacturers, who yearn for the good old days when skirts were skirts.

If you represent the plumbing and heating business, you are the mortal enemy of the textile industry, because warmer homes means lighter clothes. If you represent the printers, how can you shake hands with the radio equipment man? If you represent the retail clothiers, can you speak a friendly word to the automobile trade representative—the man who is encouraging your tomers to sink their salaries in installments on new c

Defines Types of New Competition.

These are really only obvious forms of what I h called the new competition. The old competition that between the members of each trade organizat One phase of the new competition is that between trade associations themselves—between you gentle who represent those industries. Inter-commodity com tition is the new competition between products used ternatively for the same purpose. Inter-industrial c petition is the new competition between apparently u lated industries which affect each other or between s industries which compete for the consumer's dollar— that means practically all industries.

If your trade association represe retailers and you pass a resolut against manufacturers who through house-to-house canvassi you are dealing with another ph of the new competition—intra-ind trial competition—or, if you pre inter-distributor competition. It the competition between the vari factors in an industry to take o each other's functions in the line production and distribution.

I shall not take up more of y time in further describing the n competition. If you want more amples, I am sure that you can "r your own". I would like, rather, discuss the position of the trade as ciation in this new competition. D the new competition mean m power or less to the trade asso tion? What can the trade associat do for its industry in fighting its b tles in the new competition? H can the association executive a himself to lead his members in this gigantic econon warfare?

Where Did It Originate?

Let us first study the causes, the origins, of the n competition as we face it today. If we search d enough, we shall find that the real causes of the new c petition are in the most fundamental tendencies of economic life of this country and of the world.

One of the forces most active in the new competit is what I have called "distributive pressure." It is pressure of goods for outlets and also the suction of o lets for goods. This pressure may express itself in str ing for greater volume of sales—or it may express its in seeking more direct channels of distribution betw producer and consumer. That is, it may attempt to crease sales by developing new markets through adv tising or it may result in cutting out the wholesaler the retailer. The pressure of outlets for goods is just powerful and insistent. Drug stores sell thousands items which cannot be called "drugs"—cigar stores s—department stores sell both and in some cases sell automobiles and real estate. The meat packers, ugh their sales organizations, are disposing of a huge me of butter and eggs and other foods.

---

* Vice-President, American Exchange Irving Trust Co., New York, N. Y., before the Chicago Business Secretaries Forum, February 16.

'his distributive pressure is the result of growing uctive capacity on the one hand and growing mar- on the other. New industries spring up and grow t—old industries grow greater. Their plant ca- ty increases—many industries have never reached ndred per cent of the capacity developed during the and post-war booms. The machines must be fed if ndustries are to survive.

Vaiting for the production of these industries is a ılation with the greatest buying power ever known orld economics—the greatest buying power and the est standards of living. Nothing appears to be too l for Americans. And in spite of the lamentations he higher-browed novelists, in no country in the d is taste less standardized than here. There is room ılmost every kind of product to find a market. And e is enough margin between subsistence and income he majority of families to encourge freedom of . The American pocketbook has the world to choose ı. It may not always choose wisely, sanely or artis- ly, but it is in that constant choosing that we find origin of the new competition.

Must Use New Weapons.

'he weapons of the new competition are not the ons of the old—the old weapons have been modern- and made more powerful, and new ones have been d. Co-operative advertising is one of the greatest has been growing greater every year. But adver- g and merchandising, even with all their manifold urces and their new methods, are not the only ons in the armament of the new competition. The competition, like the old warfare was a matter of lry charges or infantry marches. Now we have air- es, submarines, tanks and poison gases and propa- la. War isn't in the open, nor is the new competi- Methods are more indirect and more sweeping.

nstallment selling is simply one phase of the new etition. It is not a simple and isolated phenomenon e studied as an economic freak. When it first be- e widespread it was used more or less unconsciously was simply a blind method of increasing volume kly. But now it is being used more deliberately— those who have used it have begun to realize why working out as it is. It was not simply an accident it developed in such an extraordinary way in the mobile industry first. It was not simply that the mobile industry was ahead of the others in mer- dising technique. Installment selling was the only ible answer of the rest of the automobile industry e price challenge of Henry Ford. He attempted to an automobile within the financial reach of almost one. The others had to do the same and they used nstallment plan recognizing that in the psychology e average American, the future is a long way off the down payment counts most. Ford met the chal- e with a $5 down plan and more liberal installment s—but had to give it up. Now his idea seems to be op selling automobiles and to sell transportation in- —he plans to take old Ford cars and rebuild them flat rate of sixty dollars. How will the other auto- ile manufacturers meet this? And where will this kind of competition lead?

Drags Government Into Fray.

very state legislature and every government depart- t in Washington, are the battle-ground of the new etition. Legislation, regulation, rate-making and arch are all weapons in the new competition and many industries owe their prosperity to the strategic use of them. To help them in the new competition, the farmers are invoking federal aid. What did federal and state highway aid mean to the automobile and construction and road materials industries? What is the demand for price maintenance legislation and "truth-in-fabrics" legislation? What were the local ordinances against house-to-house canvassers sent out by direct-selling manufacturers? What are the elaborate freight-rate hearings before the Interstate Commerce Commission but the new competition between different sections of the country? What are tariffs?

Some of these weapons are old, of course, but we have learned a great deal in using them in the last few years. I cannot overestimate the gigantic and vital problems they present to trade associations. Most associations have committees, legislative committees, committees on research and on publicity. But I need not tell you how ninety-nine per cent of such committees work. Until the trade associations see the new competition as a whole and see these various weapons in their proper relation to the struggle, there will be many defeats.

What is the good of your overwhelming the country with co-operative advertising if a competing industry manages to obtain legislation against you? What is the good of developing a cost-accounting system if a competing territory manages to obtain more favorable freight rates.

The Trade Association's Problem.

How can the trade association meet the new competition? Perhaps it would be simpler to answer this question if we analyze the new competition into its main types and study the problems which each type presents to industries and the trade associations which represent them.

Inter-commodity competition is, of course, the most spectacular of all. It is the one which seems most of all to have caught the business imagination of the country. More and more business men are beginning to appreciate what inter-commodity competition means to them. More and more they are calling up their trade associations to help them—because inter-commodity competition cannot be fought single-handed.

Take the great war on the dining-room table, for instance. Three times a day practically every dining-room table in the country is the scene of a fierce battle in the new competition. Shall we have prunes for breakfast? No, cry the embattled orange-growers and the massed legions of pineapple canners. Shall we eat sauerkraut? Why not eat green olives?, is the answer of the Spaniards. Eat macaroni as a change from potatoes, says one advertiser—and will the potato growers take this challenge lying down?

The doctors and dietitians tell us that a normal hard-working man needs only about two or three thousand calories of food value a day. A banker, I suppose, needs a little less. But what am I to do? The fruit-growers, the wheat raisers, the meat-packers, the milk-producers, the fishermen—all want me to eat more of their products —and are spending millions of dollars a year to convince me. Am I to eat to the point of exhaustion or am I to obey the doctor and let the farmer and the food packer and the retailer go broke? Am I to balance my diet in proportion to the advertising appropriations of the various producers? Or am I to balance my diet scientifically and let those who over-produce go bankrupt? The new competition is probably keenest in the food industries because there we have a very real limitation on what we can consume—in spite of higher incomes and higher living standards, we cannot eat more than we can eat.

(Continued on page 140)

Are You Courting Court Expense

By

PHILIP L. SNIFFIN

Motor Truck Advisory Engineer

You are Responsible If Your Driver Causes Damages To Others On the Public Highway. When To Insure and When To Carry Your Own Risk.

THREE months ago, a jury and court in an Eastern state awarded damages of $20,000 to the widow of a man who had been killed in an automobile accident.

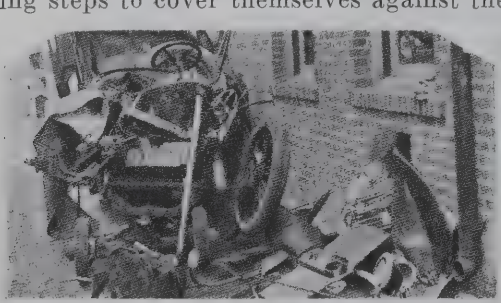
The man who was killed was a passenger on a delivery truck. He had "thumbed" a passing delivery car and the chauffeur had obligingly stopped and taken him in. A short distance down the road, the truck met with a serious accident. The passenger was killed and the chauffeur was seriously injured. The court held the owner of the truck must pay.

Legal technicalities are things that few of us know a good deal about. We know the difference between right and wrong and our sense of justice guides us fairly well along the road of life. But now and then we bump up against some point of law that we did not know about and the experience proves a costly one. Perhaps we do not agree with the justice of it. It may be something new that we had not heard about. Maybe we feel grievously wronged, but we have no redress. The court holds that ignorance of the law excuses no one.

You Are Responsible!

With the increasing city traffic problems the city milk dealer holds himself probably more liable to legal difficulties in his delivery department than in any phase of his business. Here he has a number of vehicles on the road or public highway, liable to countless breaches of the law, and here his fate is in the hands of drivers for whose actions while in the performance of duties, he is legally bound. The driver is his agent, paid by him, and he is responsible for whatever the driver does while acting in this capacity and within the scope of this employment.

The larger city milk distributors have only recently recognized the full importance of this. They are taking steps to cover themselves against the possibilities of big losses. Even at the expense of considerable time and money, they have found that it is worth their while to keep posted on their liabilities and to protect themselves as far as they can.



The incident mentioned in the beginning of this article is typical of the sort of thing for which you should look out. It is one of those cases where the head should rule the heart. The many court decisions in cases of this kind make it very plain that where a plaintiff has been caused damage at the hands of any individual, any property or any equipment, employed or owned by person or firm, that person or firm is held in strict count for the amount of the damages.

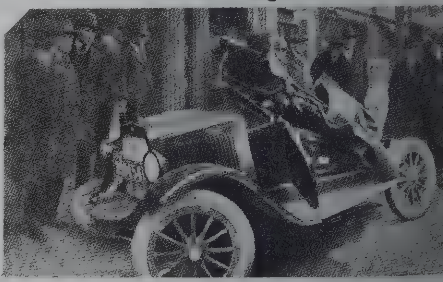
The biggest and most frequent cause of troubl the case of accident with damage to the person property of others. Here, where the fault is with driver, you are plainly held for damages and c costs. Several cases have come within the writer's servation where a driver has left a truck on a hill, brakes have become released and the truck has r down the hill with resulting damages. In a case of kind, even though it could be proved that the drive ercised due care in setting his brakes, even though us say, a chld had climbed into the driver's truck released the brakes, the owner of the truck is held sponsible for all damage.

Fines and suspended or revoked licenses for t violations also cause a lot of trouble for the owne delivery trucks. Every business has a certain am every year, charged off to delivery costs for court f Suspensions of licenses are also quite frequent and means, of course, that the driver must be discharged and a new one employed, involving considerable pense and inconvenience in breaking in a new man. in all, as will be discussed later in this article, it is p able to take good care in hiring drivers and to see they are instructed to obey traffic laws. One con has this sign in large letters prominently posted i garage:

> OBEY ALL TRAFFIC LAWS. THIS COMPANY IS IN FULL ACCORD WITH EXISTING TRAFFIC REGULATIONS. REGARDLESS OF YOUR PERSONAL OPINION, THEY **MUST BE OBEYED.**

"Meeting the Traffic 'Cop.'"

The garage superintendent of a New York City concern told me recently that he believes a g many milk dealers are being taxed considerably for the impertinence of their drivers. Perhaps you know from your own experience that the average police officer responds better to a gentlema diplomatic attitude than he does to a hot-tempered gumentative one. Truck drivers are too apt to fo this. Their first natural instinct is to "stick up for t side of it" and to somehow make a case for themse I have talked with many traffic officers and they



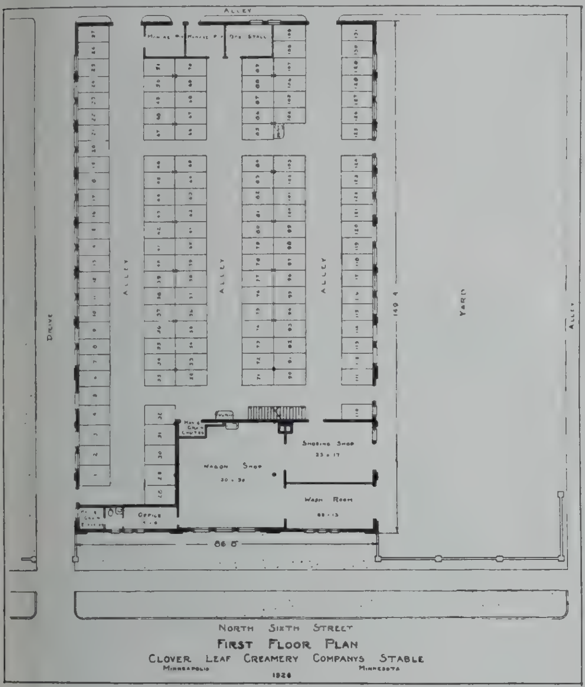
(Continued on page 48)

A Stable That May Become a Garage

Big Minneapolis Milk Company Builds a Stable and Work Shops Building That is a "Thing of Beauty" and at the Same Time Most Practical

WHILE in the Flour City one day recently it was the privilege of a Dealer representative to visit and carefully inspect the fine new stable and k shops of the Clover Leaf Creamery Company.

The front is two stories and basement in height and fireproof construction. This section contains boiler n and storage room in basement, wagon repair shop, se shoeing shop and wagon washing space and office first floor. The second floor contains storage space about two carloads each of baled hay and feed.



Chutes for hay and grain drop to the first floor at a venient location for distribution to the stalls. There lso a well equipped harness making and repair shop he second floor.

The rear portion is one story in height and contains ls for 131 horses, a box stall and two manure pits. se pits are separately ventilated through turbine ven- tors placed in the roof. The stable proper is ven- ed by five large disc fans placed in special housings on the roof, controlled separately from switches below.

The water troughs consist of five-foot white enamelled bath tubs set up on concrete bases.

Floor of entire stable, including the stalls, are of an asphalt mastic, eliminating all wood plant floors and the attendant unsanitary spaces underneath.

Partitions between stalls are of plank with open spaces between for ventilation and also arranged for easy removal for replacement when damaged. Windows throughout are steel sash. Windows in stable proper are placed close to ceiling and are hinged at the bottom to swing in. This provides the maximum of light and readily controlled ventilation. The exterior walls are of brick and hollow tile, the face brick being used on all sides of the building. The ornamentation is of cast cement and was designed and cast specially for this building.

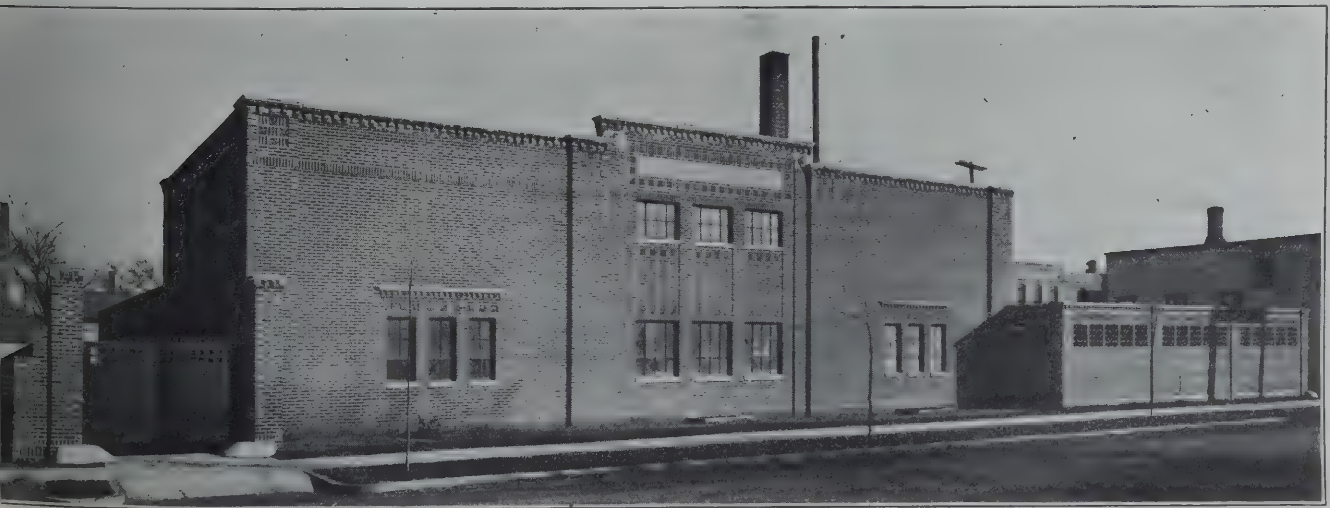
As the building is located in a residential district it was the aim of the owners and architect to erect a building that would be somewhat out of the ordinary in design and not have the appearance of a stable. The wall at the right is about 12 feet high and conceals the wagon yard.

Trees have been planted in the boulevard and shrubbery will be placed against the building in the spring.

As the roof over the stable is absolutely flat and constructed with only one set of joist it was felt necessary to provide the best possible insulation, against the extreme heat generated by the sun on this large roof expanse. The entire ceiling of the stable proper is lined with cork board 2 inches thick nailed directly to the underside of the joist. A coat of portland cement plaster is applied to this. This has proven very effective both against heat in summer and heat loss in winter. The roof covering is a five-ply pitch and gravel carrying a 20-year guarantee.

The construction of the one-story part is such that should it ever be advisable to discontinue the use of horses for delivery and use trucks instead, the stalls and all wood posts could be removed leaving only two rows of steel columns down the center of the building, allowing ample space for storage of trucks.

The building was designed and erected under the personal supervision of Arthur Dahlstrom, architect, located at 1200 2nd Ave., So., Minneapolis, Minn.



Street View of Stable and Workshops Building.

Teaching the Public to Like Milk

"Here's to a Glass of Good, Cold Milk and May We Live Long and Prosper---By Drinking It!"

By THURMAN B. RICE, M. D.*

THE prosperity of everyone connected with the milk industry—and I find as I look at the advertising pages of THE MILK DEALER that the range is far wider than one would suppose—is fundamentally dependent upon the willingness of the public to buy milk after it is produced at the dairy, put through all the various processes, and finally delivered on the front step.

Therefore it is up to the dairyman, the milk dealer, and the manufacturer of milk handling machinery and supplies to keep constantly at the task of the education of the public to a practical realization of the fact that good milk is the best of all foods. There has been a great increase in milk consumption in recent years, but we are still far from the ideal of a quart a day for each child, and a pint for adults that is held up before us by nutrition experts. As one goes along the streets and sees bottles sitting out it is evident that we are falling far below such an ideal—at most houses one quart, at a considerable number two, and very rarely three quarts. My own family—two adult and three children—uses three or four quarts a day, and the milkman regards the fact with amazement. A few days ago he suggested that we had "better get a cow."

How can the public be induced to use more milk? The superior food qualities of milk must be kept constantly before the public; the value of vitamines and mineral salts should be stressed—but that is another story than the one we are proposing to spin on this occasion. We have in mind the problem of winning over to the use of milk those folks, of whom there are not a few who say, "I don't like milk" or "milk doesn't a with me."

Rather careful analysis of the reasons why folk not like milk reveals the fact that most of the objec can be removed when they are once understood. better for the milk dealer if the dislike can be overc and it is infinitely better for the individual, becaus or she needs milk as food, and may in case of ce diseases be put upon a milk diet by the physician man who dislikes milk is out of luck in such a tingency.

One of the most prevalent causes of dislike for is found in those folks—nearly always adults, of co —who have helped in the production of the family ply of milk in the early days when they were "bac the farm." They do not like the odor of milk, an course the taste is very like the odor. Milk to the closely associated with the cow stable. They do know that dairy cattle and dairy barns are very di ent in these times than in the times when they were on the farm. As young folks they had to get up e and go milk the cow in the cold and dirty barn. It a most unpleasant task and they still hold a gru against milk because of it.

These folks need a visit to a modern dairy farm. if they cannot have that they need pictures showing handsome, well-lighted barns, cleaner than many ho Pictures illustrating improved modern methods gradually get the idea across that the milk of toda not the milk of yesterday.

Milk that has been heated to pasteurization tem ature in a vat that will allow the escape of vapors then cooled over open brine pipes will of course lo large part of the objectionable odor. The milk de should try to keep out of his supply such milk as h definite odor of some food that the cow has eaten as whiff of such is sufficient to undo the effort of mont building up an appetite for milk. Invalids and folk a milk diet are particularly "finicky" about odors— odors so faint that other folks cannot detect them.

Heat has the effect of increasing odors, while chi decreases them. Milk that is ice cold has quite a ferent odor and taste than milk that is warm. In connection should be mentioned the fact that odors c come from the icebox in which foods are kept. On fish, muskmelon, cucumbers, pickles and other hi aromatic foods will give the corresponding scent to milk in the same icebox. Stale, moldy, or spoiled is also bad in this respect.

If one wishes various desirable flavors may be g the milk by the addition of extracts of different s It is perhaps better if we learn to like milk "strai but if folks prefer it doctored up in some way the no serious objection and the whim should be sati if possible. A touch of cinnamon or nutmeg, a s tang of lemon or vanilla will certainly detract not from the food value of a glass, but will make it palatable for some.

A great many folks do not like cream, excellent though it is. In such case they may not like whole because of the cream which it contains. Skim mil

DE LAVAL DE LAVAL

Do you doubt this?

The New Series De Laval produces very heavy cream with less loss of butter-fat than was ever before possible and is particularly efficient in re-skimming gathered cream.

—from a recent De Laval advertisement.

Then read this —

The Augusta Creamery Company, of Augusta, Wis., recently installed the No. 71 New Series De Laval Separator shown in the illustration. In a recent letter they say:

"We are very well pleased with its operation. We are re-skimming gathered cream and find it economical and a very close skimmer."

New Series De Lavals skim clean at any reasonable working temperature and do it when run at their full rated capacity. Regardless of whether it is more economical for you to separate with milk at pasteurizing temperature or many degrees lower, or whether you want cream testing 10% or 60% butter-fat, a New Series De Laval will save you money.

Write for full information.

DO Your Customers Like Cottage Cheese

Are You Making It An Important Product In Your General Sales Program, Or Are You Just Supplying Whatever Demand Exists?

SOME milk distributors are content to make just enough cottage cheese to supply the occasional customer who asks for it. Others even go so far as to educate their milk customers to make cottage cheese in the home.

The latter figure that if the housewife can be trained to make good use of any surplus milk she may have from time to time that she will be more liberal in her milk purchases. We are not prepared to say what results in increased milk sales follow this latter policy.

But we are convinced that the dealer who supplies cottage cheese only on demand is making a mistake. It doesn't pay to do anything half heartedly and we strongly advise either making cottage cheese an important product in your sales program or leaving it entirely alone.

According to a recent survey made by us there are many dealers who are making nice money in pushing the sales of cottage cheese. They are not content with supplying whatever demand exists. They go out and stimulate demand.

This survey shows, however, that these men are in the minority. The great majority of dealers make cottage cheese, but comparatively few really appreciate the possible profits in the business.

The very few who do not make cottage cheese might well adopt the policy of one big Eastern firm that spends money to teach its milk customers how to use the surplus milk in the home by suggesting the making of cottage cheese. That firm emphasizes the ease by which it can be made in the following recipe:

How to Make Cottage Cheese.

When milk is sour and thick put in shallow pan, set in warm place; either on back of stove, warming shelf or in oven, leaving the door open. Let stand until it separates. Put in cheese cloth. Be sure the bag has been wrung out. First let it drain all night, then add a little salt and pepper.

It's just a case, we believe, of doing a job well, or not doing it at all. It is a mistake to just supply demand, because in doing so there is the temptation to kill whatever demand exists. A poor quality product is usually the result of a half-hearted sales program. The effect on organization morale is dangerous.

Why don't you folks who are making and selling cottage cheese as a side issue profit by the experience of those dealers who are making real money in big s of this product? Surely the palates of your custon are not so different.

Possibly you have tried pushing cottage cheese s and failed. If so, did the quality of your cottage ch measure up to the quality of your other milk produ Did you try to see how good you could make it or cheaply you could make it? Did you really believ your sales program or were you ready, right from start, to give up easily? Did you put on a real ad tising campaign?

We don't expect you to give us the answers to t questions. It will be sufficient if you will just ans them mentally. In these answers you may find the sons why you failed.

Just for the information of the dealer who may to go out after a real cottage cheese demand we are ing to publish a number of recipes that are being cessfully used by milk dealers who have built up a demand in their communities. These recipes are nished to their milk customers in printed form an other ways known to the successful sales manager.

Here are some samples:

Cottage Cheese Sausage.

1 cup cottage cheese.
1 cup dry bread crumbs, or ½ cup cold cooked rice, and ½ cup bread crumbs.
¼ cup peanut butter, or 2 tablespoons savory fat.
¼ cup coarsely chopped peanut meats.
½ teaspoon powdered sage.
½ teaspoon thyme.
1 tablespoon milk.
1 teaspoon salt.
¼ teaspoon pepper.
⅓ teaspoon soda.

1 to 2 tablespoons finely chopped onion.

The bread crumbs may be made from left-over corn, barley or other quick breads.

Cook the onion in the fat until tender, but not brown. Dissolve the soda in the milk and work into the cheese. Mix all other dry ingredients thoroughly with the bread crumbs. Blend peanut butter and onion with the cheese, and mix the bread crumbs with them. Form into flat cakes, dust with bread crumbs or corn meal, and fry a delicate brown in a little fat in a hot frying pan.

(Additional cottage cheese recipes appear on page 107

TS OF VERBIAGE, BUT AN INTERESTING DECISION AS WELL.

here is a law in Wisconsin which prohibits discrimi-
n in prices paid for milk. The attorney general of
tate was asked to give an opinion in a certain case
lawyer that he is, he used many words but his deci-
is of interest just the same. Here it is:

Harry Klueter,
and Food Commissioner,
ol.

ear Sir:—You ask for an official opinion with respect to
actions affected by the provisions of sec. 133.09 of the
nsin statutes. You have narrated the facts concerning
ansactions of two companies as follows:

A company which we will designate as A owns and oper-
manufacturing plant at a city we will designate as Z
milk is purchased and manufactured into various
odities. This company pays $2.20 per hundred for
testing 3.5 per cent milk fat, plus a ten cent hauling
ance, to all milk producers whether they deliver their
to the plant at Z themselves or whether they have it
d there. In other words, if they haul their own milk
receive ten cents a hundred for hauling it and if they
their milk hauled by another individual this ten cents
undred goes to the milk hauler. This same company
tes a receiving station at Y where milk is received,
and sent to the plant at Z where it is manufactured
arious commodities. The cost of transporting the milk
Y to Z is twenty cents per hundred. At Y this com-
pays $2.05 per hundred for milk testing 3.5 per cent
k fat or twenty-five cents per hundred less than it pays
which twenty-five cents represents the handling and
orting cost of milk incident to getting it delivered to
anufacturing plant at Z from its receiving station at Y.

company which we will designate as B owns and oper-
manufacturing plant at a city which we will designate
where milk is purchased and manufactured into vari-
ommodities. At X this company pays $2.25 per hun-
for milk testing 3.5 per cent milk fat delivered to their
This company also operates a receiving station at
er city which we will designate as W where milk is
ed and later transported to the plant at city X to be
factured into various commodities. At the plant at
V Company B pays $2.25 per hundred for milk testing
r cent of milk fat. The cost of handling milk at W and
orting it from W to X is approximately the same as
es for similar services from Y to Z."

c. 133.09, subsec. (1) provides as follows:

ny person, firm or corporation, foreign or domestic,
ed in the business of buying milk, cream or butterfat
e purpose of manufacture, that shall discriminate be-
different sections, communities, towns, villages or cities
s state, than is paid for the same commodity by said
y of this state, by paying for such commodity at a
price or rate in one section, community, town, village
, or to any person, firm or corporation in any locality
s state, than is paid for the same commodity by said
, firm or corporation, foreign or domestic, in another
, community, town, village or city, or to another per-
rm or corporation in any locality of this state, shall be
of unfair discrimination, which is hereby prohibited
eclared unlawful; provided, that it shall be a justifica-
or such a discrimination in price if the difference is
commensurate with an actual difference in the quality
ntity of the commodity purchased or in transportation
es or other expense of marketing involved in said pur-
"

is statute prohibits unfair discrimination in the pur-
of dairy products, but contains a proviso that it shall
justification for the discrimination in price if the dif-
e is merely in the transportation charges.

ter carefully considering the transactions narrated by
believe that the statute has not been violated, because
ifference in price in each case was in transportation
es, and this the statute expressly gives as a justification
discrimination. It is true that Company A has a dif-
system than Company B, while Company B takes care
transportation charges and pays the same price in both
ies for milk, Company A makes a difference in the price
pays and makes the patrons of each locality stand the
f transportation.

der the wording of this statute I believe this is justi-
This is a criminal statute and must be strictly construed

Clean Cans an Aid to High Quality

Sterile Cans Pay Big Dividends. Clean Utensils are the Keystone to Improvement and It Must Start on the Farm

By J. J. PUGH*

THE distributors of market milk have for several years recognized the importance of clean, dry cans at the farmer's barn for the collection of fluid milk. At the time our health boards began organizing milk inspection departments and records were made of the bacterial count of milk, distributors of market milk or fluid milk were astonished to find that their bacterial counts were running into the millions, and their milk was not in a satisfactory condition when it reached the plant. A great deal of money was spent in installing machinery in these plants for the purpose of pasteurizing or the killing of bacteria.

When the plant owners became more accustomed to the idea of bacteria and what it meant to their industry they went further in their investigations and soon decided it was a great deal better to keep the major portion of bacteria **out of their milk** than it was to depend entirely on pasteurizing equipment to reduce the count. They also found that milk of high-acid content or a poor product to start with made a very poor finished product and that sour milk was a total loss as far as the fluid milk plants were concerned.

A Typical Creamery Installation.

A large amount of money was then spent through the agencies of fieldmen, who were sent out to instruct the farmer how to properly produce his milk, care for his cows and cool the milk after it had been put in the can. This, of course, helped a great deal, but this did not do as much for them as they thought it would.

Cans Are Source of Contamination.

Upon looking for further causes of high bacterial count in the milk received they found that the milk cans which they were sending back to the farmers were a source of contamination as great as any other one thing. They immedately began looking around to see what they could do to overcome this condition. It was found to be practically impossible under ordinary factory conditions to have a man hand-wash cans and keep up with the work of getting the product into the plant anc the kind of a job that he would have to in order to nish a sterile can. Consequently mechanical can w ing equipment came into prominence, with the result quality was materially improved.

The butter industry is now going through the s thing that the milk men had to contend with a nur of years back. Modern methods of manufacture are upon the cream after it is received in the plant, and m an off-score is taken because the cream was in poor dition when it was received at the station, and dirty are causing a great loss to the butter industry all the United States, because the importanec of clean, cans is not recognized as it should be. The hand tank is a great source of contamination in the creame The cream that is gathered often, and near the plan in very fair shape. Cream taken in at stations shipped some distance to a centralizing station is alv very high in acidity. If cans from both classes of t are washed in the same hand tank, cans which brou in cream of high acidity or any can that has develo an off-flavor or odor through bacterial growth, cont inates the hand wash tank that it is washed in. temperature of such water is not high enough to kill teria of this type so that cans which are in a reason condition when put into this same wash tank pick large number of such bacteria. The steaming treatm as ordinarily used, is not severe enough to reduce bacteria that are added to the can through the wasl just mentioned; consequently when the can is relid sealed and returned to the patron it has one of the prolific starters in it of undesirable bacteria.

The average farmer is not equipped to properly his can when he receives it at his home. He simply ri it with cold water (some times not even doing that) starts putting in his gathering of each day. By the he has filled the can and started it back to the sta the cream has in turn multiplied the bacteria many, m times and an undesirable mass is the result. High ity in itself is very undesirable, as it causes exce neutralization which hurts the body and keeping qu of butter. It also causes high temperature to be in pasteurization which often causes a mealy butter.

A Magician Might.

With all the modern appliances in vogue in the ent butter manufacturing plant it is an impossible t to do when you try to make a good product out poor raw material. It can not be done any more suc fully than an expert workman could make a first- suit of clothes out of a shoddy piece of material. quality is not there and it will not stand up. Bu manufacturers are realizing that these conditions and are harmful to their finished products and are idly realizing that the receiving room and wash r of their plant is as important to them and the pro they put on the market as the churn room and refrig tion.

As an illustration of this point, the writer rece called on a manufacturer of butter in one of the Mi West states and was shown through a new plant very proud manager. We made a complete tour o

This little Booklet has saved thousands of dollars in interior painting

MANY plant managers are cynical about the claims made for interior paints. No wonder—in view of their costly experiences with paints that yellow—paints that flake—paints that get dirty and can't be washed!

It is difficult to prove in a short advertisement that any paint overcomes all these objections and yet actually *costs less* when applied.

But we believe that our booklet, shown above, contains facts and honest testimony of actual users, which do prove that Barreled Sunlight resists yellowing, will not flake, washes like tile, and can be applied at the lowest cost per square foot covered.

The manufacturers of Barreled Sunlight have been specialists in the industrial white paint business for over 20 years—long enough to know most of the problems and also long enough, if thousands of satisfied customers mean anything, to solve those problems pretty completely.

The coupon will bring you a copy of the booklet and a sample panel painted with Barreled Sunlight.

spection, starting at the office and going through the churn room, refrigerating room, boiler room and so on. It was a very pleasant sight to see the many pieces of sanitary equipment, the daylight factory, hard finished walls, perfect floors with good drainage and in fact everything to make a modern butter manufacturing plant. As we went along the writer made a mental account of the approximate prices of the machinery which we passed and on returning to the office remarked to the manager that he had a very wonderful plant and that he must have spent at least $60,000.00 in this building in order that he might turn out a good piece of butter for his trade. He very proudly assured me that his machinery, and the installation charge on it, had cost his company $71,000.00 to set the plant up as I saw it and assured me that every dollar was spent in order that he might manufacture a good grade of butter.

One thing I had noticed and immediately called it to his attention. Out of the great sum of money he had spent to build the modern plant to process the cream after he had received it, he had not spent over twenty dollars in his can washing room for a wash tank. This made it impossible for him to send back a clean, sterile package to his patrons, enabling them to send him a better grade of cream to start with. I think this illustrates my point very fully.

Can Washers Relatively Inexpensive.

A number of manufacturers recognize the importance of clean and dry cans for their patron but look at the first cost of such an installation and allow it to frighten them out of this very necessary investment. A number of other manufacturers make personal excuses to themselves by saying that they are too small for mechanical can washing equipment, when really the cost per can is ridiculously small, taking as a basis a can washing machine that would cost $1,250 in a plant washing 200 cans per day. Supposing that the can washer will only last five years and at that time be a total loss, we would find that it would cost him about 34/100 of a cent per can washed during the life of this machine.

So much for the cost of the equipment to do the work. The operating cost is not any greater, placing the running time of a machine to handle 200 cans an hour and figuring that it would consume approximately 20 boiler horsepower in steam in this length of time, taking coal at $6.00 per ton, we would find that it would cost three hundredths of one cent per can washed. This would make a total of 64/100 of a cent per can, figuring the coal consumption and the life of the machine on a five year basis as stated.

I am sure that there is not a manufacturer of butter in the country who would not be willing, on the basis of 200 cans a day, to spend $1.28 for machinery and operating cost in order that he might have a clean, dry, sterile can to send out to his patrons, and thereby greatly improve the condition of the cream which he receives in his plant. There are very few operators who do not spend many times this amount each year for improvements in their make room and refrigerating room, trying to get a better grade of butter, but they are putting the horse behind the buggy in cases of this kind as the damage is done to the cream before it arrives at the plant. It should be protected at its source instead of trying to make the improvement after the damage is done. There are very few plants where it is not possible to save a great many more dollars in the actual labor incurred by hand washing than the cost we have mentioned of mechanical washing.

The fact that a mechanical can washer will use
15 to 20 boiler horsepower per hour in steam in
shows the severe treatment to which the cans are
jected in mechanical washing. The water in whic
cans are washed and rinsed carries temperatures o
degrees or better; the steam jets are enclosed
hooded machine so that large openings at high pre

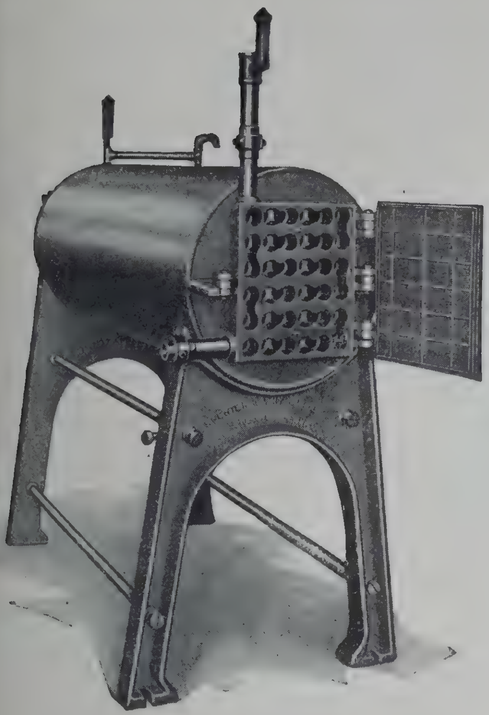
ANOTHER EXAMPLE OF THE VALUE OF MIL THE PERFECT FOOD.

Professor R. A. Peters, in an address at the Sc
Masters' Conference at Oxford, Eng., stated that
certain number of orphan boys who had been dr
to the Navy one pint of milk per day was given, i
dition to their basic food. In a specified period the
who were fed on the ordinary diet increased in w
by 3.85 pounds, but boys on a supplementary milk
increased in weight by 6.95 pounds. The latter boys
increased in height to a greater extent than the fo



The Hoosier Condensed Milk Co.

Bluffton, Ind.

Use

THE CHESTER BARREL HEATERS

By the installation of a 20,000 lb. per hour Chester Barrel Heater the Hoosier Condensed Milk Company have effected a saving in coal consumption of about 15%. All the milk going into the hot wells in this condensing plant first goes through the barrel heater and is brought up to a proper temperature which eliminates the necessity of condensing steam in the milk while in the hot wells. This eliminates the cost and time consumed in recondensing this condensed water out of the milk again.

Many condensed milk plants are using this type of installation with the best of success and we would be pleased to give you complete information concerning the installation of such a machine in your plant if you will advise us what your conditions are.

The Universal Milk Bottle

Milk Distributors in Southern California Find a Big Saving in Using the Same Bottle. Members of Their Association Must Use Universal Bottle Exclusively, and No One Else Can Use It

AT THE Oakland convention of the Southern California Milk Dealers' Association, Harry A. Walsh, secretary, reviewed the experience of his association for the past year in dealing with the bottle question. He said:

"At your meeting last year, my predecessor, Carl E. Winkley, addressed you, giving a full detailed statement of the adoption and use of the Universal bottle. At that time the Universal bottle had not been in use sufficiently long to prove its complete success, but after another year's trial, we have found it to be a great help in reducing an excessive bottle expense, both in the quantity of new glass bought and the bottle exchange cost.

"To give you a short resume of our method of handling the Universal bottle: All new bottles are purchased on requisition of the association and from bottle manufacturers who are licensed to make them. Each member is required to furnish us a record monthly of all bottles used and by comparing the number purchased with the number used, we are able to establish the number each dealer should buy to maintain his average and to carry on his business.

"The record is very necessary, as it is absolutely essential that each member buy his proportion of the whole, otherwise one member will be buying more than his share and others less. If any member consistently buys less than his share, he is in danger of losing his license to use the bottle.

"We have observed standard specifications as nearly as possible in the manufacture of our bottle and we use a number two cap seat. A good feature of this is that it has eliminated the different size caps and when the Universal bottle enters the filling room, there is no danger of a wrong sized cap going on the bottle.

"After compiling a year's figures we find that the average trippage has very materially increased over that of the privately owned bottle and that we get an average of thirty-three trips to the bottle. This includes three classes:

Combination Distributors.
Retail Distributors.
Wholesale Distributors.

"The man doing only retail business shows a very high trippage, this being due to his better control of his customers' returns, while the wholesale shows the reverse. The average retail trippage is forty-three and six tenths, while the wholesale shows only twenty-four and one-tenth.

"The Universal bottle bears the symbol of the Southern California Milk Dealers' Association, a series of dots around the neck, and a double cross on the bottom. It is easily distinguished in a case. The bottle is registered in the state and county, and the bottle exchange has full authority to prosecute any person using it who is not licensed to do so. Our members in turn are not allowed to use an outsider's bottle and they strictly conform to this ruling.

"The benefits from the Universal bottle to our members can not be listed in cold figures, because aside from the material gain, we have obtained a better understanding between our members. Many long, dry hours of
cussion and argument had to be gone through befo
unanimous workable plan to suit everyone could
established.

"Credit should be given to those men who evol
the idea of the Universal bottle and for the many sa
fices, both in time and money, which our members h
unselfishly made for the welfare of their associatio
a whole.

"We hope to reach a point where members' dri
will pick up only Universal bottles, the object of
move being to reduce sorting and handling expense

"Recently we have had to decline several appl
tions to join our association from dealers who have b
in the business several years. Our association is not s
ing any more members at this time for the reason
we do not wish to widen our bottle territory too f
This move on our part is not to make a closed shop
our association but we are proceeding slowly attend
to first things first and any widening of our bottle te
tory at the present time might entail a prohibitive su
vision cost.

"We do not wish to leave an impression that we
self-contained or selfish, but we wish to preserve
which we have built with a lot of effort. When we
over the names of our members, every one, without
ception, in our organization was a pioneer in the l
field, and his business success is the result of hard w
and long hours, on his part, every day in the year.
is entitled to the benefits that may come his way.

"The Los Angeles territory is well equipped
creamery plants, both old and new, for several y
to come.

"While the population in our locality was grow
faster than it is now, the bottle cost reached high fig
to take care of saturating new territories with bott
but with the showing up of new arrivals and the un
mous use of the Universal bottle, our members can
expect and look forward to a fair return for their lab

The address by Mr. Winkley, to which Mr. W
refers, was delivered at a previous convention of
association and explains the plan of using the Unive
bottle in detail. We quote from his address as follo

"The milk dealers of southern California decided
their bottle expense was excessive, and at once entered
plan to reduce the expense. A bottle charge of one cent
in effect, and the number of bottles recovered from the
dumps was increasing each month. A flat amount was
to those in charge of the principal dumps, and they so
out as many bottles as they could and turned them ove
the bottle exchange. There were large numbers of bo
that were not recovered, principally because of the low va
tion placed upon them by the dealers.

"About this time the Universal bottle was suggested
solution to the bottle problem, and a committee of Los
geles dealers was appointed to study the bottle question.

"The committee's efforts were directed primarily to
practicability of a bottle charge more in keeping with
actual cost, believing that if all who come in contact
milk bottles were brought to a realization of their va
that they would be more inclined to keep them movin
their proper channel.

"The principal factors to be considered in establishi
bottle charge are:

"First: The deliveryman.

BURRELL

SIMPLEX

Dairy Creamery Cheesery and Milk Plant Apparatus

When writing to D. H. BURRELL & CO., INC., *please mention The Milk Dealer.*

"Second: The wholesale customer which includes the grocer, the cafe and restaurant man.

"Third: Transient trade such as workmen on buildings and construction gangs.

"Fourth: The housewife.

"Of all those mentioned I believe the transient customer as designated, is the worst offender of all. Some of the reports that come to our attention of bottles being thrown in sewer and drainage ditches and of bottles lost and broken in buildings under construction, have caused us to feel certain of this. The bottle that is used by the housewife for other purposes than for milk service has some chance to be released and returned to the proper service, but the bottle that is broken or buried is gone forever. We therefore were agreed that our bottles should have a higher value.

"As the records of the bottle exchange showed an increasing number of bottles at the city dumps, and as the individual records of the dealers showed a continual shortage, it was evident that there was a large number of bottles out of regular service which must be brought in. This was done by paying the drivers an extra cent for all bottles over on their routes and extended for thirty days.

"The results were very satisfactory and the city was well cleaned up of stray bottles preparatory to the inauguration of a higher bottle charge.

"On a certain date a charge of three cents became effective on all wholesale trade. All bottle transactions are now recorded on the sales tickets, the same as any other merchandise sales, and apply to charge and cash business alike. The use of bottle deposit tickets for the retailer is recommended but is not compulsory with our dealers.

"One of the principal reasons advanced at this time in favor of a Universal milk bottle was the necessity of finding some way to reduce the expense at the bottle exchange. Formerly each dealer was using his own registered bottle and the turn-over of bottles through the exchange was expensive. By having one registered bottle that could be used by many plants, it was expected that a large proportion of this expense could be eliminated; and it has since been proven that such is the case.

"By this I do not mean to say that the bottle exchange can be eliminated by the use of a Universal bottle. A service of this kind is necessary in a metropolitan center where millions of bottles are handled each month, and in addition the necessity of picking up and returning cans and cases and ice cream equipment is of sufficient importance to require this service.

"At the time the Universal bottle was considered, there was an average of 1,070,208 bottles turned over to the exchange each month by the dealers in southern California. Last month the number was 759,912 or a decrease of thirty per cent. This was a saving, not only in the expense of hauling and sorting that number of bottles, but it reduced the normal breakage and chipping entailed in unnecessary handling.

"As the number of Universal bottles in circulation increase, the number of bottles going to the bottle exchange decrease, for the reason that there is a considerable number of branded bottles still in circulation that are sorted out daily by the dealers, and turned over to the exchange for return to their rightful owners.

"Every time a dealer's branded bottle is lost to service through loss or breakage, a Universal bottle replaces it. Our last survey of the number of our dealers' branded bottles still in service showed them to be approximately ten per cent. When the number gets down to five per cent or thereabouts, the remaining branded bottles will be taken out of service as the expense of sorting will offset any service value they have if they are still used.

"The saving in the plants, by the use of the Universal bottle, is considerable. The dealers in southern California for many years have been obliged to maintain sorting crews who have picked out all bottles bearing the brands of other dealers, and have turned them over to the bottle exchange. Under the present plan our forty-four dealers, doing ninety per cent of the business, all using the same bottle, reduced the number of bottles sorted thirty-seven per cent in the past year. The dealers also reduced their breakage and had the use of considerable storage space otherwise used for exchange bottles.

"We have several well defined provisions which govern the use of the Universal bottle. They are contained in a license agreement which specifies that all bottles must be purchased on requisition of the association, and from bottle manufacturers who are licensed to make them; also each licensee is required to furnish a record of the number of bottles used by him each month. By comparing the number purchased with the number of bottles used, we establish the number each dealer should buy to maintain a fair proportion of the bottles required in his business.

"This is very necessary and unless some check is made, it would be possible for one dealer to buy less bottles th his proportion, at the expense of other dealers.

"This record is closed every three months and a balar is shown that establishes the standing of each dealer, a if any discrepancies occur, an accounting is asked for and adjustment is made.

"We tried to observe standard specifications as near possible in the manufacture of our Universal bottle. It h a number two cap seat and the height and weight of t respective sizes follow.

Size	Height	Weight
Half pints	5½ inches	11 ounces
Pints	7¼ inches	16 ounces
Quarts	9¼ inches	26 ounces

"The bottle is registered in the state and county and bea the symbol of the Southern California Milk Dealers' As ciation. So that it can be readily picked out in a case, eith when filled or empty, we have a series of dots encircling t neck which can be easily seen and make the bottle stand o prominently when placed alongside other bottles. The b tom is well marked for convenience in sorting in the plan and at the bottle exchange.

"The bottle exchange has full authority to prosecute a person using the Universal bottle who has not a license use it, and likewise has power to prosecute our own me bers if they use bottles other than their own or the Univers bottle. This is all well understood by the dealers of sou ern California, and most of them are observing the law.

"There is considerable advantage from the manufactu ers' standpoint in using a bottle of this kind. They are e abled to make continuous runs of the one bottle witho frequent changes of moulds, and their expense of maki and maintaining a large selection of moulds is eliminate Their stocks of finished bottles, too, are more easily reg lated by having the one principal brand.

"Our September report, based on the total number bottles used by the forty-four dealers, shows that the avera number of trips per bottle was 40.7. Those having an exc sive retail business went beyond the average and those havi exclusive wholesale business fell below, and the plants doi both retail and wholesale run close to the general average.

"This record convinces us that we are making some pro ress in reducing bottle expense in Los Angeles, and we expe to reduce it still further as we continue with our program.

"To those who are interested in establishing the use of Universal bottle, we would admonish them not to expect have it in operation too quickly. There was a time when thought ninety days was sufficient to replace most of t branded bottles with our present bottle. It is true that the end of each ninety-day period, the results begin to felt, but it will take at least a year before the real saving made.

"The larger the group, the greater will be the saving using a bottle of this kind, and while we are not advocati the enlargement of our group at present, the time will con I believe, when all reputable dealers in our section will given an opportunity to enjoy its benefits.

"To summarize, then, the advantages to be gained using the Universal bottle, we find

"First: The manufacturer is well pleased because he c standardize his production.

"Second: The distributor enjoys a saving in his sorti expense, lower cost of exchange service, and eliminates cessive breakage due to duplicate handling.

"Third: The driver has no difficulty in collecting his b ties now as they all are of the same value and mostly of t same brand.

"Fourth: The wholesale customer likes the plan becau he can accept all bottles from his trade and there is no fr tion between him and the driver in the charge or credit empties.

"In conclusion, let me say, that co-operation, above all, the one thing that makes a movement of this kind possib A fine spirit of co-operation is always manifest by our deale and we feel that with this spirit existing, we can go far the solving of the problems that are always to be met with the dairy industry."

Efficiency Sticking Out All Over

California Milk Bottling Concern Adopts Labor Saving and Cost Reducing Methods to Push Sales and Handle Its Products

By JAMES V. MURRAY

QUIETLY, without flare of trumpets, yet steadily and according to the best business practice, has the milk and cream business of the California Milk Company, Inc., of San Francisco, grown until, within the short space of fourteen years, the concern has built up a fleet of 40 trucks, delivery and cargo, owns a large dairy of its own, with a fine herd of cows, at Alvarado, in Alameda County, and owns an entire city block of territory in the site where is located the present-day plant. This large property investment was made, although the plant now only occupies and needs half of the land for its business, with an eye to extension in the near future, and the buildings not now in use by the milk company are rented out to others on short leases.

The business is as closely knitted together an organization and layout as can be found in any line of food products receipt and distribution in the city, the company operating from its center at 529-567 Bay Street to cover the large Latin Quarter, without scattering delivery effort to distant portions of the city on an uneconomical hauling basis.

By reason of making most of its deliveries "close to home," with each driver doing intensive work on his route to try and get EVERY milk user and distributor in this quarter to patronize the California Milk Company, the concern uses for retail and small-store deliveries, for the most part, a fleet of 25 Ford delivery wagons which, despite their low value, to the "man in the street," the way they are kept up, seem to be among the best "milk wagons" traversing the city.

These little wagons are small because they never get far away from their base, and can quickly return for more milk, cream, butter, eggs and certified milk; the company handling all of these dairy products, chiefly of their own raising or manufacture; and get back on their routes handily and economically.

These delivery wagons are painted maroon, with the bodies open on both sides and the rear, and are equipped with chained stakes for holding the cases of bottled goods in place, with their low beds making them easy to load. There is a great deal of white appearing in the painting of the body, and above the roof is a long, white sign carrying the company name in large letters, the color scheme being blue lettering, flashed with gold, against a white background.

The trademark of the company is shown on all equipment, even the heavy trucks running supplies over to the city from the farm in Alameda County, across-the-bay. It consists of a baby nursing a milk bottle and the same figure appears in every form of advertising used by the company, including the colored slides thrown on the screens of movie houses, found to be a good means of advertising in San Francisco, especially on a product like milk.

For heavy hauling there is a fleet of trucks of local manufacture, ranging from two to four tons, and for the daily haul to the city depot from the dairy and depot at Alvarado, there are two 5-ton trucks.

With its own repair shop on the premises, and a force of mechanics to attend to repairs and replacement of parts, all of the automotive upkeep is undertaken by the milk company itself.

With the fleet "in" at the depot at around three each
afternoon, using a lubricating oil and a gasoline, ha
truck, buggy, a shopman goes through the fleet gi
service of oil and gasoline each evening, so that no t
is lost in the morning in obtaining these necessities.
the same time the shopman does more than this! Wh
a truck or delivery wagon has been reported faulty, a
servicing all of them, he attacks the "innards" of
offending unit of the fleet and endeavors to make an
the-spot adjustment, replacement or repair. If una
to do this, the vehicle is reported out of order and ro
over to the "bone-yard" as the shop is called, for at
tion of the mechanics at leisure.

At the same time, the management makes the ne
sary adjustments of delivery routes, or puts on
country run one of the 4-ton store delivery trucks
that the burden of hauling and distribution is equali
all around and the work of obtaining milk from the f
and delivering it to customers goes on unhindered.

"The day before" is the big day with this compa
It likes to know today just what it is going to do
morrow, and this forehandedness applies in the busi
all the way through.

For, although intending to put in, within the n
two years, a complete modern dairy-delivery plant on
city block on Bay Street, by keeping down the inv
ment on machinery and building up to this time, it
been able to apply its surplus to the acquisition of
land, thus settling for all time the question of lease.

And further, by such means has been built up
large dairy farm and depot at Alvarado, enabling
company to realize its profits as producer, jobber,
retailer, by supplying **itself** with necessities as far
practicable.

In addition to the fleet in the city, a small squad
of trucks is maintained "outside," in the country, wh
travel around daily "picking up milk," and other c
modities, from the surrounding farms. And by prod
ing the bulk of the merchandise itself, the company
a big say in what the purchase price shall be, instead
being at the mercy of others as would be the case if
much money had been expended in San Francisco w
the concern was building up its present-day structu

It was F. Borghi, now president and general mana
of this progressive dairy products corporation, who, w
a single proprietor, fourteen years ago, making deli
ies to "friends" on a small scale, conceived the idea
surrounding himself with "key men" with capital,
reaching out into the city for the services of the bes
his compatriots capable of building up milk routes
their own. Each man is really a partner in the en
prise, wagon driver as well as the stockholders, w
each retail delivery man wholly responsible for his
route.

Adding to the organization D. Cordoni, corporat
secretary and plant manager, G. Lombardi, treasu
and outside superintendent, and J. Nicolai, assist
secretary, office manager and cashier, with the serv
of the wagon "milkmen" available, routes were quic
added to the business until, up to this time, twenty-
large ones have been obtained.

And intensive work in each neighborhood has
sulted in a close-woven network of customers, with
Bay Street depot as hub of the half-wheel, which grea

PEVELY

A two-and-one-half-ton tractor with six-ton Fruehauf Semi-Trailer carrying 1500 gallon tank—one of a number of such haulage units used by the Pevely Dairy Company of St. Louis.

IAULING 1500 GALLONS OF MILK AT 50% LOWER COST

THE type of haulage unit pictured above—a 2½-ton tractor with a 6-ton Fruehauf Semi-Trailer—carries a 1500 gallon glass-lined tank. It is being adopted by leading Milk Dealers throughout the country on milk-collection hauls from rural districts—daily trips varying fron 40 to 125 miles each way.

With pneumatic tires, this unit usually averages a speed of from 25 to 27 miles per hour. Taking all kinds of delays into consideration, such as waiting at railroad crossings, the slowest time shows an average of at least 18 miles per hour.

As a result of 7-days per week performance records now available, it is estimated that the cost of operating this high-speed unit is approximately half of what it costs to use a 5-ton motor truck on solid tires with a 1250 gallon tank. The investment on equipment, too, shows a saving of from $500 up in comparison with the first cost of a 5-ton truck with tank. And a long haul with the big truck becomes a much shorter haul, in point of time, when you use the unit shown above!

simplifies customer problems and reduces cost of maintenance and delivery of fleet to low proportions.

Everything in the Bay Street plant is closely coordinated and small space for each department is the rule. **Space**-saving devices and machinery, rather than labor-saving, have been the rule, thus far, in line with the general policy of the company to keep its precincts "narrow" until ready to put in the new plant.

When the trucks return with the glass in cases, the bottles are checked in, and care is taken that credit has only been given for those bottles belonging to the company. This, because, with some delicatessen and grocery stores, the proprietors are not always as careful as they might be about taking in the right bottles for credit. And with some housekeepers not as scrupulous as they might be about the return of bottles to the right store, the company would stand considerable loss if this feature were not kept under control.

Cases are then put through an opening in the partition wall which is the mouth to the wash-rack. There is a Berg universal washer right to hand, with an attendant ready to wash out the bottles. Where there is a caked bottle here and there, it must be cleaned out by hand. As fast as a case and its bottles is washed and is clean, onto a conveyor it goes and travels through the steam tunnel to the roller-equipped incline leading into the filling room.

Piled high on floor trucks equipped with large wheels, the cases are hauled by hand to a point where are stacked the clean bottles, in their wooden containers, ready for the use of the "fillers." Three men work at the revolving, electric-driven Milwaukee filler, one taking clean bottles from cases and dropping them onto the machine, the other, in front, controlling and watching the fill of bottles, and the third removing filled bottles and dropping them into their compartments in the wooden cases. A fourth man supplies empty bottles by hauling cases as needed from the tiers, and also assists in any other work that may be required.

The general scheme on working the three "fillers" is to have them change about in their duties, from time to time, to relieve monotony and to change the burden onto other muscles. The job at the front of the machine, requiring sitting down, gives an almost complete rest to each man for a spell, from time to time.

The supply installation is a Jensen, with the fresh milk pumped overhead to the cooling bath. Here are two coolers through which flow the streams of milk, with sufficient head on hand to insure complete cooling before bottling.

Milk awaiting handling is kept in cold storage and there are two ice machines to supply refrigeration.

Cans are kept dry after washing by being suspended on racks of galvanized iron piping, and there are mechanical arrangements for the complete washing and sterilization of cans as well as bottles.

The groundwork has been laid for a business twice the size of the present one, by the past policy of the company, and when the new plant is opened, intensive work can then be done on the other end of the business; the acquisition of new accounts and the increasement of the sufficiency of the fleet.

INTERNATIONAL ASSOCIATION OF MILK DEALERS TO HOLD TWENTIETH ANNUAL CONVENTION.

The twentieth annual convention of the International Association of Milk Dealers is to be held in Columbus, O., on October 19, 20, 21 and 22. The headquarters will be the Neil House.

Executive Secretary R. E. Little has arranged for an attendance of 1,500 members.

MACHINERY AND SUPPLIES ASSOCIATION WI MOVE TO LARGER HEADQUARTERS.

The Dairy and Ice Cream Machinery and Suppl Association which for some years has had its offices 1328 Broadway, New York City, will move some time April to larger headquarters necessitated by the gro ing scope of its membership service and general tra development activities, in one of New York City's m recent new large office buildings, the Pennsylva Building, 225 West 34th Street.

The Pennsylvania Building is less than two blo distant from the present quarters of the association, j opposite one of the entrances of the Pennsylvania R way Station, and within ten minutes of New York Cit other great mid-town terminal, the Grand Central S tion. It is within brief walking distance of the Pe sylvania, Herald Square, McAlpin, Martinique, Impe and Waldorf-Astoria hotels, and within ten minutes' tance of the Hotel Astor, Hotel Times Square and Grand Central Terminal district's hotels.

NEW PLANT IN OWENSBORO, KY.

Ground was broken recently for the Evansville P Milk Company's $40,000 plant at Eleventh and Loc Sts., Owensboro, Ky., which is expected to be comple within 90 days.

It will be a one-story brick building and will equipped with all modern conveniences for receiving handling cream and whole milk, making ice cream pasteurizing milk.

When finished the company will vacate the build on East Fourth street and concentrate its activities at new plant near the Union station.

The business is owned by the Evansville Pure M Co., Evansville, Indiana.

MILK BECOMING POPULAR IN BRAZIL.

Under the supervision of the Food Control Board the Ministry of Commerce, during the first six mon of 1926 there was a total of 1,878,401 liters (ab 1,991,000 quarts) of fresh milk sold in Rio de Jane The milk thus sold was offered at forty-eight statio A fair amount of milk is sold without the supervision the board.

According to a report to the department of comme by Assistant Trade Commissioner D. Duval Brown, Sorocabana Railroad, of Brazil, has just put into serv a refrigerator milk car with carrying capacity of 6, quarts of milk in cans. This car is carried in fast frei and passenger trains, carries two tons of ice and deliv its contents, milk, in Sao Paulo and Sorocaban at the of the 190-mile journey in good condition.

NEW MEASURE INTRODUCED IN INDIANA SENATE.

A measure was introduced in the Indiana state sen by Senator Claude S. Steel which would make it unla ful to discriminate in the purchase price of the c modities in different localities of the state.

This measure would provide that firms or pers buying milk, cream or butterfat who shall discrimin between different territories or localities by buying c modities at a different price or rate in one locality t is paid for the same commodity in another locality, a making due allowance for the difference, if any, in act cost of transportation, shall be guilty of unfair crimination and provides a fine of $100 or thirty days jail, or both. Meeting a price of a competitor is construed as discrimination under the terms of the

ARE YOU COURTING COURT EXPENSES?

(Continued from page 28)

often told me that they "wouldn't have given the fellow a ticket if he hadn't been so nasty about it." I know of several concerns that have found it pays to pass on the idea to drivers that a "gentlemanly, good-natured attitude will accomplish far more than all the arguments in the world."

I think many concerns make a mistake when they let a driver appear in court to answer his own traffic summons. In most cities the judge in traffic court has a leeway running anywhere from a suspended sentence or a five dollar fine all the way up to fifty or seventy-five dollars and his decision for the amount of the fine depends on probably three things: The case, the way the case is presented and his good or bad humor at the time. There is no question about the fact that the person who appears to answer the charge and the way in which he handles the situation has a lot to do with the amount of the fine.

Drivers, of course, should be penalized or docked in some just way when they are fined for traffic violations. It is not altogether possible to make the driver pay his own fines although some concerns are making this rule and paying slightly higher wages to cover it. Drivers generally consider this unjust and will not stand for it. At best, it is always a cause for argument and ill-feeling. The driver is certain to have plenty of excuses and he is certain to feel that if the summons was for speeding, he was going fast only so that he might give better service to his employer.

The most satisfactory way to handle court fines, expenses and accident prevention is in connection with other driver incentives in a contest or bonus plan with merits and demerit points. A thing of this kind is not difficult to put in operation. Pay the standard wage for the type of man you want. Keep an individual account of each driver's record. Pay the standard local wage for the type of man you want and allow a bonus of so much per month payable to the driver if his merit and demerit points are within a specified average.

How Demerit Plan Works.

The following is a description of the way in which one firm has successfully carried out a plan of this kind: An individual record is kept on each driver, to which the employee may have access in the office of the assistant general manager. Credits are allowed for commendable acts, deeds of heroism and loyalty, good judgment in emergencies and courtesy. Demerits are provided for an absence of these factors. An accumulation of 75 demerits results automatically in discharge from service. If extenuating circumstances exist and under proper authority reinstatement is approved, it will be with 50 demerits against the employee's record. A second accumulation of 75 demerits will result in permanent discharge.

The company sets aside a fund equivalent to $5 per month for each driver, which is credited to the record of the individual and paid to him on December 1st of each year if he has sufficient merits to his record to justify it. Employees must be with the organization continuously for 6 months to participate in the bonus. There is one exception to this rule. Employees laid off on account of reduction of force, through no fault of their own, are entitled to receive bonus pro rata for the period worked.

The merits are assigned on the following basis:

For meritorious service in avoiding accidents or unusual assistance or good judgment in emergencies, or any commendable act out of the strict line of duty, 10 merits are credited, on authorization of the head of the department. A clear record for 6 months wins 15 merits. The demerits are given for the following
fenses:

		Offenses
	1st	2nd
Missing route or reporting late for work....	1	3
Discourtesy or altercation with customers..	5	10
Smoking on duty.........................	1	5
Reading on duty.........................	1	5
Inattention to duty......................	1	3
Careless driving	5	10
Failure to report accidents or defects coming to the attention of those whose duty is personnaly to report such.............	5	10
Criticising management or policy of the company except to superiors..............	10	10
Lack of neatness........................	2	5
Signals imperfectly given and respected....	3	5
Violating speed regulations..............	3	5
Rough handling	5	10
Failure to have proper lights, and in working order	3	5
Violating overloading regulations.........	3	5

Court fines and accident expenses demerited according
expense incurred and nature of case.

The garage superintendent of this company sa
"As an indication of how our demerit system works
in one important respect, it may be interesting to n
that 80 per cent of our drivers last year had no accide
of any variety—not even the scratch of a fender.

Five Means of Protection.

Besides the bonus demerit plan, there are four ot
good ways in which you can protect yourself agai
heavy court costs. The five means of protection are:

1. Bonus demerit plans.
2. Careful selection of drivers.
3. Driver educational meetings.
4. Bulletins and posters.
5. Insurance.

The selection of drivers should be handled carefu
and systematically. And remember that a cheap
may be easy to get, but he can do enough harm to y
business to more than make up for his lower wag
The best policy by far is to set a wage a little above
average for your locality. Then you can afford to
mand more of the applicant.

In one company every applicant who makes a fav
able impression in an interview with the personnel
ficer of the company and gives surface indications of
ing likely material, must submit a list of his previous
tivities as far as employment is concerned for a period
5 years. The personnel officer, through letters and p
sonal inquiry, checks up on the record of the applica
not in a general incidental way, but in a systematic a
thorough manner. Preference is invariably given
married men.

The two salient things that are looked for in
analysis of an applicant center around the questions

1. "Is he of a nature to yield to training and
cipline, and to recognize and assume responsibility?"
2. "Does he actually want permanent employmen

Experience as a driver is a minor factor in consic
ing an applicant's qualifications. The company's
tem calls for a thorough course of schooling befor
man is given charge of a truck, and while any previ
experience in handling automotive equipment is of va
to him it is not essential.

When an applicant has been found, after inquiry
be worthy of employment he then is required to pas
complete physical examination.

Safety Meetings Reduce Risk.

Several concerns are finding that they can cut do
their accident liabilities by holding what they
"safety meetings" for their drivers. These are usu

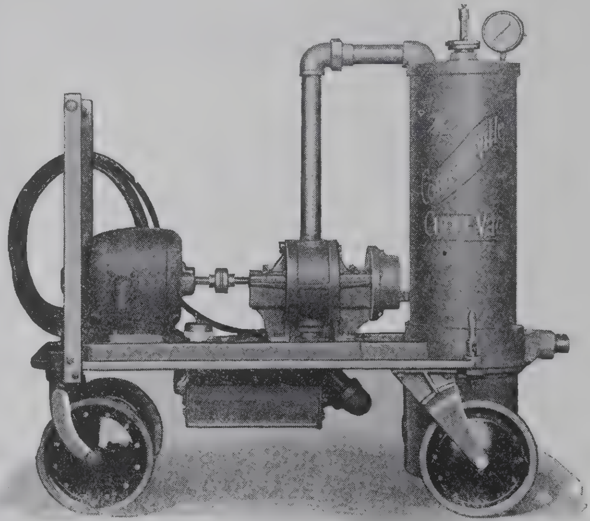
Makes 500% with a Curry-Vac

The Wilson Creamery Company, Detroit, Mich., was able to operate with one less stable man after installing a Connersville Curry-Vac. This one saving makes 500% on the investment in one year.



Consider that The Wilson Creamery Company's horses are more healthy, can do more work and that they present a better appearance, although the cost of cleaning is reduced.

Is there a Dairy or Creamery that couldn't profitably use a piece of equipment that makes 500% on the investment in one year?

A Curry-Vac will do as much for you. Try one and see. Write today.

(Agents in All Principal Cities)

dinners held in the evening during which saf measures and methods of avoiding accidents and tra violations are discussed. The H. C. Bohack Co. Brooklyn, N. Y., recently held such a meeting at wh the drivers met a traffic court judge and heard his s of the story on traffic troubles. This company is h ing safety meetings once a month and they have down accidents from the start.

Here is another good idea that helps to reduce accident liability. Any police officer will bear witn to the fact that no two stories of the same accident agree in detail. Experienced truck operators likew know how difficult it is to get a clear idea of what curred from the description of the driver involved. overcome this and arrive more or less at the true fa of the case, J. A. Henley, the well-known delivery sup intendent of the Hudson Store at Detroit, has had m a model of a street intersection incorporating a vari of corners and crossings, with street car tracks an traffic tower.

On this are placed miniature street cars, automob and tracks which can be located as desired. When driver is reporting an accident, this board is placed fore him so that he can demonstrate the conditions relative positions of the obstacles involved and a tr comprehension of the facts of the case obtained. several occasions this model has been of great value court.

Keep Drivers Posted.

Recognizing that the problem is largely in the ha of the drivers, one concern in Los Angeles puts the lowing message over to all drivers in the form o printed card in the truck cab:

"Most accidents are avoidable. We will not exc accidents which are plainly your fault.

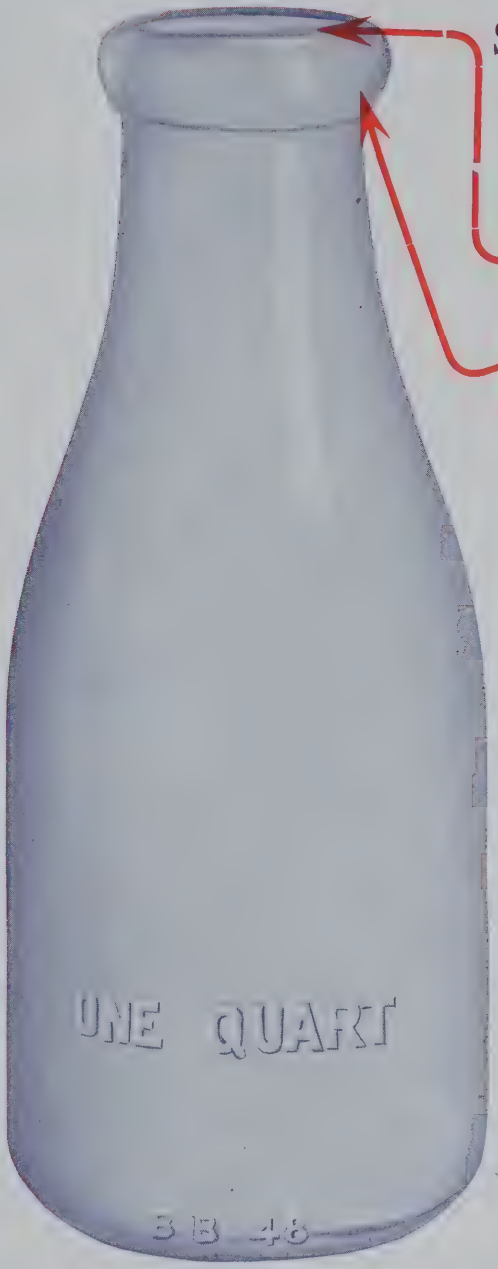
"You are instructed to report any accident damage to property of any nature. Violation of t rule will not be excused.

"Avoid all arguments with officers, pedestrians drivers of other vehicles. You gain nothing by th and they may react against you. If an argument of nature develops, hold your temper; explain in a gen manly manner, your side of the argument, if your planation does not satisfy the other party, inform h that you are not authorized to settle these questions, are instructed to deliver your load and return; give h your name, truck number and truck license number, ask him to report the incident to the transportation m ager. If the occurrence or accident is liable to be o nature at all serious, obtain names of all witnesses p sible, and then be on your way."

Insurance is a thing on which the opinions of tr owners vary greatly. Although many truck owners not agree, it is the writer's unqualified opinion that concern can afford to run a truck unless it can afford have that truck insured on both personal injury, liab ty and property damage policies. The risk is entir out of control of the owner of the business. It is in hands of the vague human element which is always v able and as such, it is too great a risk for the owner take.

The only other safe alternative in the writer's perience is for a concern to carry its own insurance this is sometimes done successfully where the fleet large one. An interest department bank account opened and **at regular periods,** semi-annually, a dep is made to this account, drawn from the business, equ lent to the amount of the premiums if they were p to an insurance company. This fund is used to losses much as an insurance company would pay th and very often, over a period of time, the idea will sh a profit.

Automatically Processed Milk Bottles of Quality



Six Little Details All Big

1. Round cap seats that hold the cap
2. Well formed heads designed to obviate chipping

KOKO-MALT

It's Making a Big Hit !

for their

Chocolate Malted Milk Drinks

HERE is a new product which is blended from a special Dutch-processed, double milled cocoa and pure barley malt extract with special flavoring to intensify the full chocolate flavor and absorb the bitterness of cocoa.

DAIRIES bottling chocolate milk should be interested in this new preparation. It means a great saving in your syrup purchases. The cost of one gallon of delicious chocolate malted syrup made from KoKo-Malt, which is sufficient to flavor 10 gallons of milk, is 75 cents.

We will be glad to send a sample of KoKo-Malt sufficient to make one gallon of syrup to those interested in this new hit.

TEACHING THE PUBLIC TO LIKE MILK.

(Continued from page 30)

er the contents of a bottle from which the "top
" has been poured is still a very valuable food and
well be used by those who do not like the richer
s.

specially is skim milk to be recommended to people
are afraid to drink milk because they have heard
it is fattening, and they are very anxious to stay
A great deal more milk would be drunk if it were
or the fear of the bulging waistline, or that the fair
er might lose the dimensions of a clothes horse.

hysicians are sure that a great many women are in-
g themselves by a too scanty diet. They eat a very
lanced ration and as a result are particularly in
of a "protective" food. Milk is commonly con-
ed out of the question in such diets because it is so
tening." Skim milk has lost a considerable part of
protective" substances, but is still very much better
no milk at all.

Milk tastes flat" say some of its detractors. But
so do meat and most other foods taste flat until salt
lded. Friend wife forgets to salt the oatmeal or the
mbled eggs occasionally, and is very soon reminded
e fact by the members of the family. Most of us
milk without salt, and can hardly understand why
want salt in it, but some even want salt with water-
n, apple, peaches, and other things so good that it
s they couldn't be improved. There is no accounting
astes, so if they like their milk better with salt in
ere can be no reasonable objection.

n excellent way to get the salt into the milk is to
soda crackers with it. A glass of high grade milk
ed to the right temperature, and a dozen fresh soda
kers is as tempting a layout as a king could desire.
dentally there is no better way to take milk than in
this manner. Nature intended that her ideal food
ld be taken slowly rather than be gulped in great
lows. The baby gets its milk through tiny holes in
nipple; the adult should sip his milk mixing it with
r foods as he chews. When taken in this way and
oughly mixed with the crackers, the curd formed by
action of the gastric juice is fine and easily digested.
am crackers with milk makes an ideal lunch for
ing children. A glass of milk and a couple of
kers in the middle of the morning and afternoon is
ty hard on small boys as we used to speak of sum-
showers being hard on little potatoes. It makes
nes out of 'em.

ome will like milk better if it is sweetened, others
has chocolate added as in cocoa or in other chocolate
drinks that are on the market. It was formerly the
tice to give children coffee for breakfast, but milk
e cocoa is far better if it is felt that they need a hot
k. Malted milk, malted grape nuts in milk, choc-
malted milk, milk with various kinds of fruit
ps, even milk mixed with Coca Cola is served to
ons at the "stand in" lunch stalls, and no better
lunch can be found though it is probably better if
flavoring is not carried to excess else the natural
r become distasteful.

lmost everyone eats milk with cereal, and certain
r foods as coffee or fruit. In case a given individual
says that he does not like milk, this makes an ex-
nt starting place. It is a comparatively easy matter
ir a couple of tablespoonfuls of applesauce into a
of milk, and then eat it as if it were all applesauce.
ous fruit juices mixed with milk make pleasing
ks. If the juice cannot be had in liquid form a
nful of jelly can be stirred into a glass of milk,
ing an agreeable beverage.

t was formerly supposed that acid fruit juices

The Old Way—*Dragging*

The *Nutting* Way—*Rolling*

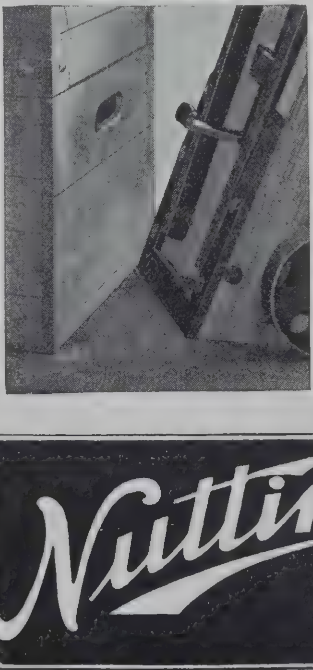
Quick Handling—the Key to Greater Profits

By far the quickest, easiest way to move milk cases short distances about the plant **is with the Nutting Milk Case Truck.**

It's the key to greater profits. While a man drags one stack of cases across the floor he can roll two or three stacks with this milk case truck. It does away with delays at the bottle washer; ends "traffic jams" at the inclined runways. Saves wear on case bottoms. No other truck is like the patented

Nutting Milk Case Truck

You simply grab and go! No nose to pry under a stack. An adjustable hook slips into the hand-hole of the bottom case. The rack supports and balances the load. Easily moves 6 to 8 cases of quart bottles.



Fits any milk case made. Thousands in use. Ask your jobber or write us for catalog C showing this and other floor trucks for the dairy industry.

Nutting Truck Company
1287 Division St.
FARIBAULT, MINN.

Nutting Floor Truck Specialists Since 1891

should not be mixed with milk, but now we know that this idea is entirely erroneous. "Give the baby milk, and also give him orange juice, but never give them together" is an old adage which is all wrong. It has been proved beyond argument that organic acids added in proper amount to milk makes it easier to digest. Orange juice may properly be mixed with milk or taken just before or just after it quite properly and safely. The wonderful new way of feeding babies with lactic acid milk is in principle identical to that just stated. The acid helps the acid of the gastric juice to digest the milk. It has been claimed that President Andrew Johnson died after eating cherries with milk over them, and we have no reason to doubt the statement, but we do not believe that the cherries or the milk had anything to do with the death. Even if there were any significance in the yarn a glass of milk with a little cherry juice in it would make a man take a chance.

Folks with delicate appetites for milk can be utterly upset by the finding of a speck of dirt in bottom of the glass, and we must confess that it isn't a very pleasant experience for any of us. It's up to the milk dealer to be sure that it doesn't happen. Until the public is educated to know that many of the bacteria of milk are quite harmless or even beneficial the dealer will have to be very careful about giving the wrong impression. A milk man of the writer's acquaintance was jubilant when he got to the place where his raw milk was under a count of 10,000 and every man can understand his feelings if he has tried sometime to produce that kind of a milk. He talked and talked about it with the result that his trade fell off perceptibly. It is true that he gained several well informed families who understood his claims, but he lost five times as many other families who thought that even a single germ in milk was too many.

Emphasis upon the superior qualities — the positive aspects of the argument—of milk will have a better effect upon the man or woman of the fickle appetite. Attention should be called to the sun-flooded dairy barn, the "contented cows" grazing in green pastures beside stony brooks, and all that sort of thing. Of course, we physicians and health officers must keep tab on all phases of the work, but if the milk dealers will handle the milk as it can and should be handled in these modern days, it will not be necessary for us to be calling the attention of the public to the various negative phases of the subject. Practically all physicians recommend milk to their patients and their families and they are all very willing to pass up mentioning the possible dangers of the milk supply if they think they dare do so. So again the responsibility goes back to the producer.

Nearly every one likes ice cream. What is ice cream? Roughly speaking, it is milk that is cold, sweet, flavored, and eaten with a spoon. Very well then, here is our cue. Consider milk as a food—a food to be eaten. It is far more than a mere beverage like coffee or tea. It has high fuel and nutritive value. Let's EAT our milk, cold, sweetened, and flavored—if we like it that way. Anyway, it's worth a trial by those who profess not to like milk.

Many folks will like milk if it is drunk from a bottle through a straw. In that way they avoid the odor almost entirely. Children think it is fun to drink through a straw, and make the milk fly. By the time the novelty has worn off they will usually have learned to like milk. Some even prefer to drink milk with a spoon rather than from a glass.

Of course, it will hardly need be mentioned that the bug-a-booes concerning the dangers from the drinking of milk are pretty much out of date. There is hardly more danger with good milk supplies than that sea serpents or dragons should come up out of the ocean and
eat us. Folks used to believe such stories, of co
Tuberculin testing of cows, clean dairies, promp
frigeration, health examinations of the hired help,
teurization, delivery in the bottle, and careful co
of the various stages of production have taken ca
that and there is no reason why these things should
be frequently mentioned as they point out the pos
phases of the industry rather than the possible dan

After children have been weaned from the b
they are commonly given a bottle with cows' milk.
a few months they are given the milk in a glass bet
meals and at the table. This is the crucial time.
easy enough to allow the child to turn away from
milk to the other new found delights of the table, bu
should not be permitted to do so. At least a pint,
preferably a quart of milk a day is the birthrigh
every child. He needs the milk and he also need
keep continuous his natural appetite for the only
that Nature has especially prepared. If in later lif
should develop tuberculosis, malnutrition, gastric u
certain forms of intestinal disease, nervous disor
kidney disease, or other fairly common complaints
very likely that his physician will recommend a
diet. If the patient likes milk he is all set, but i
doesn't, he is set back. It's a poor time to learn to
milk when one is ill, and unless one likes a given
it doesn't do him much good in a time like this.

When Mrs. Smith complains to the milk man that
Johnny doesn't like milk he should be able to ma
few pertinent suggestions that will help the harra
mother to get her children to drink the milk that
knows they need. Milk companies might do well to
lish pamphlets instructing parents in such matters t
end that the next generation may be a "protect
generation, and the milkmen be prosperous milk
It is not unlikely that the consumption of milk in a g
city could be nearly doubled if every one liked mil
the same way that they like the other good thing
life. A man, a woman or a child converted to the li
gospel of the use of milk is a life-time customer of
milk company.

If milk were an article of food that might go o
vogue the expense of propaganda urging its use m
not be justified, but milk is a food that we always h
There is no substitute for milk, and for this reason t
is no more stable—or important—industry than th
milk production. The dairy community is practi
always progressive and prosperous, and the milk d
ing community is healthy. The "synthetic milk" wi
a certain noted industrialist has proposed to make i
feel safe to predict, several thousands of years in
future.

And in the meantime let's talk milk, teach foll
drink milk, and give 'em good milk to drink. H
to a glass of good cold milk, and may we live long
prosper—by drinking it!

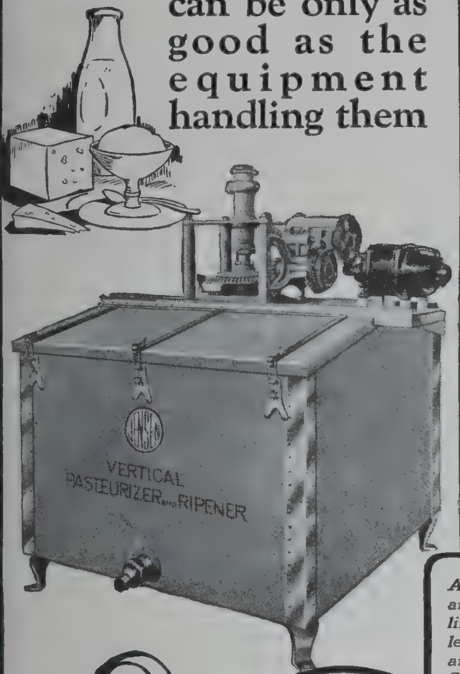
WINS NATIONAL DAIRY EXPOSITION CUP F THIRD CONSECUTIVE TIME.

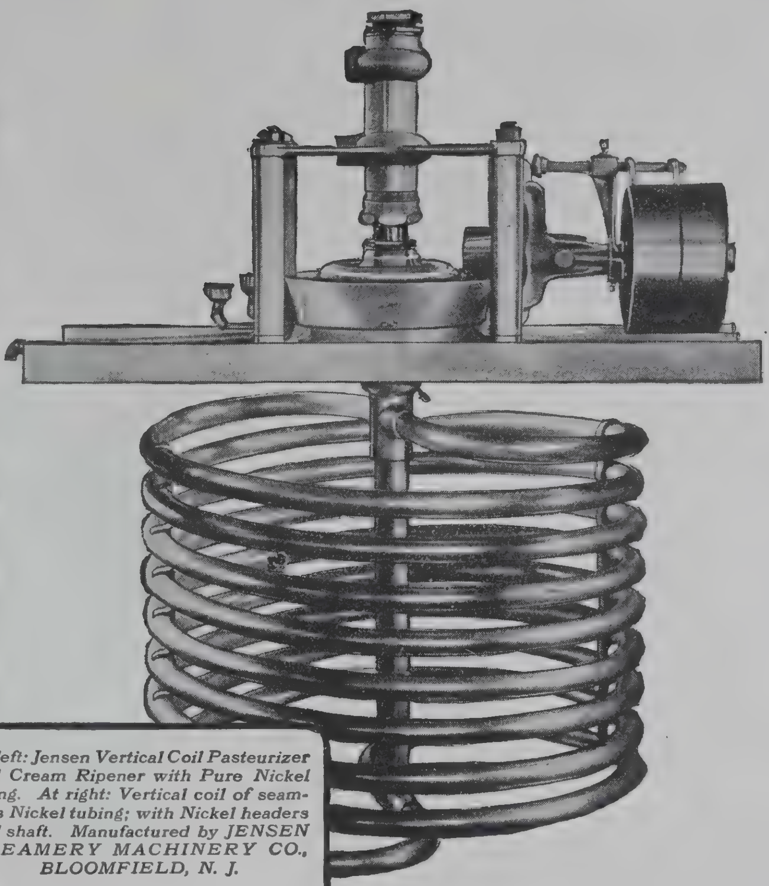
The 1926 Dairy Products Judging Team of the
State College, competing at the National Dairy Ex
tion at Detroit, Mich., brought the National Dairy
position cup for judging dairy products to Ames
for the third consecutive time, thus becoming perma
owners of the cup. The team came highest on bot
cream and milk in the various products judged.

J. W. Tatum was awarded the gold medal for the
est individual score in judging all products and the s
medal for second place on milk. George L. Myers
silver medals for second place on all products and se
place on ice cream. J. A. Earle took the bronze
for third highest individual score on all products.

Dairy Products

can be only as good as the equipment handling them





At left: Jensen Vertical Coil Pasteurizer and Cream Ripener with Pure Nickel lining. At right: Vertical coil of seamless Nickel tubing; with Nickel headers and shaft. Manufactured by JENSEN CREAMERY MACHINERY CO., BLOOMFIELD, N. J.

So JENSEN has adopted Pure Nickel

THE goal of the dairy industry is the increased consumption of dairy products. Authorities say that this expanded volume of business will come with a better product--a product handled in better equipment.

Realizing that conditions call for a metal that is easily cleaned, yet strong and durable, the Jensen Creamery Machinery Co. has adopted Pure Nickel for the coils and linings of its quality line pasteurizers.

The same properties that make Pure Nickel the SAFE metal also make it the ECONOMICAL metal for dairy equipment; for it combines long life and easy cleanability.

You can now obtain Pure Nickel equipment from YOUR manufacturer. Ask him about Pure Nickel, or write us for more detailed information.

Are Milk Products Paying Their Share?

Report of Freight Rate Committee of International Association of Milk Dealers at Detroit Convention. Chairman H. S. Van Bomel, Sheffield Farms Co., New York

Presented by GEO. E. CLINTON, Sheffield Farms Co., New York

YOUR Freight Rate Committee submits herewith its report for the past year. You are, of course, all aware that for the past two years the carriers in Trunk lines and Central Freight Association territory have proposed to cancel the special commodity rates applying on glassware, and apply the regular fifth class rates. Many conferences have been held between the railroad companies, manufacturers and assocations representing the users of glass bottles, and the railroads have submitted propositions, none of which to date have been acceptable to the glass manufacturers, glass buying public or to your committee.

A proposition has been presented to the carriers which, if accepted by them, will make certain advances and certain reductions, and will in the main afford the carriers practically the same revenue as they are securing at the present time. We are not at this time prepared to deal with the subject finally. The main object in my appearing before this group, in lieu of the chairman of the committee, is to endeavor to impress upon the minds of the members of this organization the fact that the railroads throughout the East, and in some parts of the West, have evidently decided that milk and milk products are not paying their proper share of the transportation charges of this country, and in a number of instances have filed tariffs providing for radical increases in rates, and if these tariffs had been allowed to become effective without opposition, they would have created a precedence which, no doubt, would have resulted in increases throughout the country, particularly in the principal cities of New England, in New York, Philadelphia, Baltimore, Chicago and all other Western cities where the present C. F. A. scale of rates applies.

As a practical illustration, I would like to submit what has recently happened in New England. In January, 1925, the New England roads, including the Boston & Maine, Maine Central, Central of Vermont and Rutland railroads took up with the New England Producers' Association and the Boston milk dealers the question of advancing rates on milk and milk products 20 per cent, claiming that the cost of handling milk in New England exceeded the revenue derived therefrom to the extent of 34 per cent. After this proposition had been presented to the shippers and distributors an organization of shippers and distributors was formed to combat this action on the part of the carriers, and wide-spread publicity was given to the program, as arranged by the railroads. When the railroads ascertained that they were to meet a great deal of opposition, Garrett Fort, vice president of the Boston & Maine Railroad (and this railroad was the railroad that agitated the entire proceedings), advised both the distributors and dealers that the carriers had abandoned the proposed action for the time being. In January, 1926, the Boston & Maine Railroad again presented a proposal for an increase in milk rates in New England, and this time the matter did not appear to be taken seriously by the dealers and producers, and at first no effort was made to combat the proposed action on the part of the carriers. This appeared to be due to the fact that there was no one sufficiently interested to act as a leader and was further due to the fact that milk in the Boston market was purchased on a delivered basis, and the producers had no funds to enter a fight. After some agitation by outside inter
who felt that inasmuch as the rates in New England
been set by the Interstate Commerce Commission,
as a result of the New England so-called Milk Rate (
—the commission had adjusted and set the rates in N
York, Philadelphia, Baltimore, Chicago and other C
A. cities, that any increase in New England would
turally be followed by an attempt to increase rates
both trunk lines and Central Freight Association te
tory by the railroads carrying milk into these points

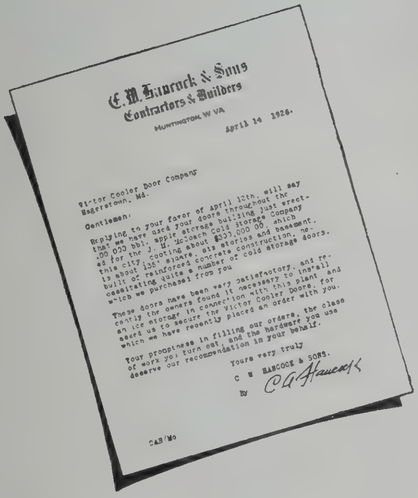
The New England Milk Producers' Association
the dealers in Boston finally held a meeting to dis
the proposed action of the carriers, and as a resul
this meeting, committees were formed representing b
the dealers and the producers, and a plan of finan
the fight was arranged between them. Several of
New York dealers were interested in the rates in cer
parts of New England territory, and for this reason,
for the reason that they felt any advance in New E
land would be immediately followed by advances
New York, together with the New York Milk Confere
Board, retained counsel, filed a petition for suspens
with the Interstate Commerce Commission, the ta
were suspended, and the first hearing was held in Bos
Mass., on May 5, 1926, and at this hearing the prot
ants took the position that they would only listen to
railroads evidence in support of their request for a
tional rates, would not cross-examine nor would t
put in evidence until they had an opportunity to
what they had to combat.

The carriers presented as their first witness, P
J. E. Slater, professor of transportation of the Univer
of Illinois, who had until Sept. 1, 1925, been assistan
the general manager of the New Haven Railroad,
who presented as his first exhibit, a composite cost st
of all of the roads mentioned above, as well as the N.
N. H. & H. and Boston & Albany Railroad, which
study was supposed to show a very large deficit in
carriers' revenue as a result of the handling of milk
the New England carriers. This cost study was uni
and instead of dealing with the adopted theories
transportation, dealt with milk purely from a passen
baggage and U. S. Mail standpoint, and presented
facts based on car foot mileage which heretofore
never been given consideration except in the case o
S. mail and in a case presented against the exp
companies.

In addition to the cost study presented by the
riers, their traffic witnesses presented facts and fig
to indicate that from a traffic standpoint, milk sh
have a regular classification, their theory being that
carload shipments should be classified as 125 per
if the first class rate, this to include what he ter
special features of icing less carload shipments and
turning empties, or without these special features,
less carload shipment should take the first class rate
return empties one-half of the rule 26 rate (the rul
rate is 20 per cent lower than the third class rate,
not lower than the fourth class rate), the carload s
ments he claims should be classified as fourth class.
of these figures would produce tremendous increase
rates, in fact far in excess of the rates actually prop
at this time, indicating very clearly that the carr

THE STANDARD VICTOR AUTO CLOSE DOOR

AND A LETTER THAT TELLS ITS OWN STORY



C. W. Hancock & Sons
Contractors & Builders
Huntington, W. Va.

April 14 1926.

Victor Cooler Door Company
Hagerstown, Md.

Gentlemen:

Replying to your favor of April 12th, will say that we have used your doors throughout the 400,000 bbl. apple storage building just erected for the J. W. McCoach Cold Storage Company this city, costing about $300,000.00, which is about 135' square, six stories and basement, built of reinforced concrete construction, necessitating quite a number of cold storage doors which we purchased from you.

These doors have been very satisfactory, and recently the owners found it necessary to install an ice storage in connection with this plant and asked us to secure the Victor Cooler Doors, for which we have recently placed an order with you.

Your promptness in filling our orders, the class of work you turn out, and the hardware you use deserve our recommendation in your behalf.

Yours very truly
C. W. HANCOCK & SONS.
By C. W. Hancock

CAB/Mo

The letter to the left is but one of the many commendatory letters that we have received from contractors as well as actual users of Victor Standard Refrigeration Products.

The reason for this unqualified popularity of Victor Products is their unfailing dependability to do the work they are manufactured to accomplish.

The Victor Auto Close Door (illustrated above) is especially adapted for storage anterooms and vestibules.

Bring your refrigeration problems to our attention. We employ a corps of refrigeration engineers who will be glad to advise you with regards to your needs. Of course, this service will not obligate you in any way.

not expecting the opposition they found, were mak the 20 per cent increase merely a preliminary incre This traffic witness presented a series of comparisons prove that his contentions were sound, and we theref had not only an elaborate cost study but a most ext ordinary traffic study to combat.

The hearing in Boston lasted for three days dur which time part of the carriers' evidence was heard, a case was then adjourned and came up for re-hearing Plymouth, Mass., on July 26th, 1926. We believe July 26th hearing was the most important milk hear that had ever been handled by the Commission. T case ran from July 26th to August 7th without a bre and was then adjourned in order that the railroad mi secure additional data as requested by the protestar which data the railroads figured would require ab ten days to secure, and the case was to be set for furt hearing thirty days after the railroads had furnis the protestants with such data. At this writing a gr deal of the data has been supplied by the carriers, there is some additional data that is required and case will porbably come up for a hearing again in Bos some time the latter part of October.

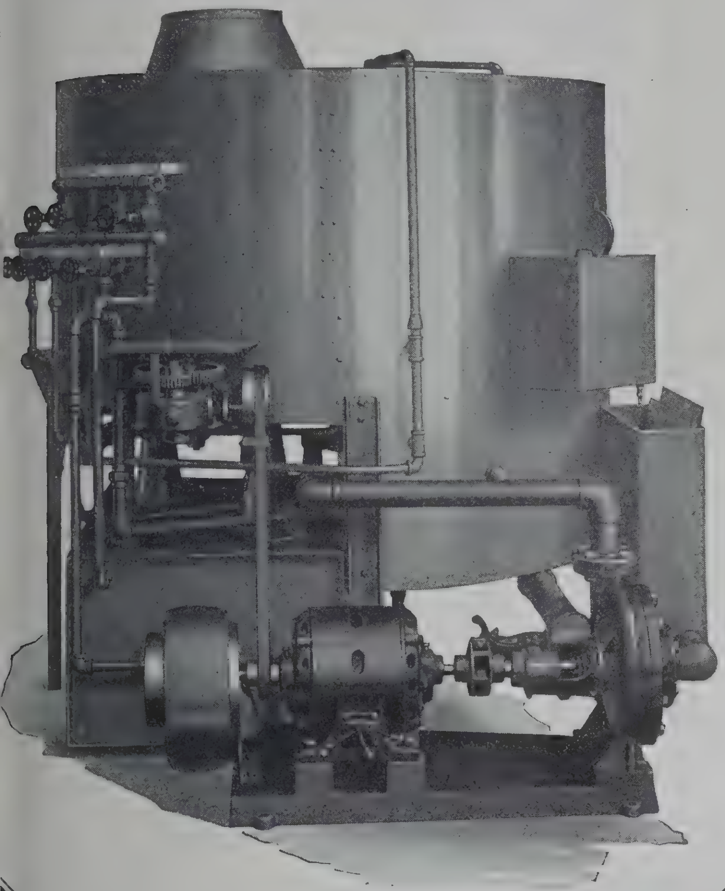
The car foot mileage theory as advanced by the r roads is the most dangerous theory that has ever b advanced against a milk interest. It is, as stated abo the same theory that was used in connection with U. S. mail pay case and is based on the material be piled 6 ft. high and with an aisle between. As an ill tration: If a combination car, that is, a mixed car, sta out from a point 400 miles from destination, the car f mileage is computed on the basis of the actual milea from the first point of origin to ultimate destinati and the space occupied is based on the material pi 6 ft. high across the car, but with an aisle between. the Boston hearing the carriers claimed that this wo mean 8 cans of milk per foot, but at the Plymouth he ing they revised this to 18 40-qt. cans of milk per fo The carload was to be on the basis of the length the car; that is, if a 60-ft. car was used, the revenue to be derived on the basis of mileage from the first po of origin to ultimate destination, even though part the contents of the car might be picked up at an int mediate point. At the first hearing in Boston, the c riers showed in their rate exhibits, rates applying i New York, Philadelphia, Baltimore and Chicago m kets, to prove that the rates in New England were o lower basis than the rates in other territories, with giving the Commission any information to indicate value of the services in New England as compared w the services in the other markets.

The case itself is so complex as to be almost imp sible to present intelligently to this group. Our m thought in presenting it is to warn the milk inter of this country of the great possibility of all the carr in the country seeking increases in their rates on m and presenting, in support of their plea for increa rates, a fallacy in the guise of the car foot mile basis.

In order to show how important the proposed i crease in New England would be, it is only necessary state that the revenue of the carriers on milk and cre into New England is approximately $5,000,000 per y therefore a 20% increase in rates would effect the m dealers in that territory to the extent of approxima $1,000,000 per year. When we stop to consider t the amount of milk and cream entering the New Y market brings with it revenue to the carriers of p proximately $15,000,000 per year, it can be readily s that if rates were advanced in New York to the sa extent as they propose to advance them in New E land, it would mean an additional burden of $3,000,0 per year to the milk interests. We have no direc

ractical, Efficient, Scientifically Correct

Complete front view of Oakes & Burger Purity Rotary Can Washer. Very solidly constructed of high-grade materials throughout. Economical and practical, the result of years of careful experimentation.



THE Oakes & Burger Purity Can Washer is not an untried experiment. Its designing engineers were intimately familiar with all other makes, and worked to combine the virtues and eliminate the known vices of existing models.

The Purity Rotary is at present the only washer with a two-speed capacity. It will deliver six freshly emptied milk cans, or three cream or condensary cans per minute. It, therefore, possesses a much wider range of usefulness than the average Rotary Washer.

The O. & B. Purity Rotary operates very simply and efficiently. Possesses many advantages. Gives a very thorough washing, sterilizing, and drying action, delivering cans bone dry and sterile. It is economical to operate; possesses a one-piece hot air coil; is easily cleaned; attractively finished; and shipped completely assembled, ready for immediate service.

You ought to investigate the Purity Rotary. Write at once for our proposition.

authentic figures to show the revenue the carriers receiving to markets such as Philadelphia, Baltim Pittsburgh, Chicago, Detroit, St. Louis or Cincinnati, probably many of you have an idea of the magnitude the increase, if a 20% increase in milk rates was put force in all of these different cities.

Your secretary, Mr. Little, knows that some of carriers entering Chicago market feel that the rates distances of more than 100 miles are on too low a ba and should be advanced. My experience in the last y is that the majority of carriers, at least in the East, f that the rates on milk and milk products should be vanced. Just recently the Great Northern, North Pacific, Minneapolis, St. Paul and St. Ste. Marie r roads proposed to increase rates on milk, cream a buttermilk transported on the passenger trains in cert territory in Montana, North Dakota, Minnesota a other Northwestern States. These rates were protes and the Commission disallowed them. If they had been protested by the shipper, they would have beco effective and there would have been another burc placed on the milk interests.

The C. & E. I. Railroad previous to June 14th, 19 carried the C. F. A. or so-called "authorized scale" rates on milk between points on its line, but carried so-called "Beatrice scale" of rates which was lower th C. F. A. scale on cream. They increased their rates cream to the C. F. A. scale, and while the increased ra were protested, the Commission allowed them, and revised tariffs became effective as of September 15, 19 These two cases are presented to you to show you th the carriers have under contemplation increased rates the commodities you are interested in, and indicate ve clearly that the carriers are not satisfied with th present revenue on milk, cream and other related ar cles. It would therefore appear, to the interest of eve member of the association, to be on the lookout for a proposal on the part of the carriers to increase rates his shipments, and I believe some action should be tak to insure the secretary of this association being advis of any contemplated increase in rates, so that your Ra and Transportation Committee can be advised, and m give consideration to the subject.

If a case is apt to develop into one which will crea a precedent, and will have as its end a possible increa in other territories, your Rates and Transportation Co mittee should be authorized to use the best possil means to prevent such an increase. This, of cour would necessitate expense, and the question of exper is a question that rests with the officers of this assoc tion.

This matter is being presented for such action in t premises as your association may deem necessary to ta and is meant to serve as a warning as to what may expected in our business in the immediate future.

⁂

MORE MILK PER PERSON IN ALTOONA, PA.

According to the records of the bureau of health, consumption of milk in Altoona, Pa., is steadily incre ing. Figures show that in 1926 the average daily c sumption was 7,120 gallons, as compared with 6,756 g lons in 1925. These figures apply only to consumpti of milk in the homes.

⁂

MILK RATES SUSPENDED IN NEW ENGLAND

The Interstate Commerce Commission has suspend the rates on milk from certain points in New Engla from February 1st to June 1st, pending the establi ment of rules regarding the icing of cars.

The Key to a Perfect Product!

NEVER since milk pasteurization has come into general use has the question of "the proper method of holding" required such serious attention as right now. Many so-called positive holders were found during the Endicott tests to be absolutely incapable of proper holding. In some cases they delivered to the cooler milk held only eight to twenty minutes. As a result of these tests you, as a manufacturer of dairy products, must feel the need for a machine that will always and positively hold the milk the required thirty minutes and at the required temperature. The Jensen-Horton-Davis Holder does just that thing. It is truly an exception as it always and accurately holds the milk. It is a "positive — positive holder" —to differentiate the Jensen-Horton-Davis Holder from any and all others yet produced because it not only holds at the temperature and during the required time, but while so doing it is physically and mechanically impossible of a single drop of milk to either by-pass or short circuit.

Losses of Fat in Buttermilk

Huge Sum is Lost Every Year to the Industry From This Source. Can Be Due to Many Factors

"Mistakes are gentle reminders that we are becoming too confident of ourselves."
—Philosophy of the Street.

IN a recent address given by G. L. McKay, secretary of the American Association of Creamery Butter Manufacturers, before the association, he stated that "it has been estimated by one writer that in one of our large dairy states, the loss of fat in buttermilk would amount to between one and three million dollars annually." Dr. McKay has pointed out that the writer was probably taking the entire loss of fat in buttermilk into account, and that there would always be some loss of fat from this source.

In making this estimated loss, the writer to whom Dr. McKay referred, only took one state into consideration, while there are, at the present time, 16 states producing in excess of twenty million pounds each. What would be the figure for the entire group? Certainly, it would mount to staggering proportions.

It is true that some loss of fat in buttermilk can not be avoided under our present system of manufacture, but it is also true that in a very great number of factories that the losses of fat in buttermilk are far out of line with good management. Losses of fat ranging from one-half of one per cent to one per cent are not uncommon. Dr. Larson in his recent address made this quite clear when he said: "Some years ago, after carrying on some investigational work on the loss of fat in buttermilk, I made the statement at one of our annual meetings that the loss of fat in buttermilk would amount to about what would make one pound of butter in every hundred pounds of buttermilk. Some of our members thought that I had made a mistake. Some time after this one of our members reported that he had checked on the loss of fat in their buttermilk for a period of two months, during the flush, and he found the loss to be nearly one per cent."

Daily Testing Important.

Undoubtedly, therein lies the trouble in many cases. Many creamerymen perhaps have the impression that their fat losses in the buttermilk are small, because an occasional test is taken and no alarming loss is shown. However, no real definite conclusions can be drawn from spasmodic testing, for there are too many factors entering into the losses which are apt to occur from day to day and give a mistaken idea of the percentage of fat in the buttermilk. Daily fat tests of the buttermilk are, of course, to be desired. They involve very little additional work, and they are apt to be very profitable as a means of checking the losses in the creamery.

To repeat, there are many factors which are apt to be responsible for large fat losses in buttermilk, but as it was pointed out by Dr. McKay, "there are two kinds of cream that are inclined to cause a heavy loss of fat in buttermilk; namely, cream that has developed a very high per cent of acid and sweet cream. Cream containing a high per cent of acid seems to precipitate some of the casein into fine lumps or granules, which may not always be visible to the naked eye. When such cream goes through the pasteurizer, these lumps are hardened to such an extent that the concussion of the churn does not break them up. Hence, considerable fat is carried off between the meshes of the casein. Sweet cream does not give an exhaustive churning due to its viscosi unless special temperatures are used."

Avoiding Losses With Sweet Cream.

In the latter case, an excessive loss of butterfat m be avoided by churning at a lower temperature. Mortensen, head of the department of dairying at Io State College, states that in Ireland a large loss of is overcome by holding the temperature of the cream 33 degrees Fahrenheit and holding until it is churn In this connection it might be pointed out that losses frequently incurred, due to the fact that the cream not held for a sufficient length of time before churni at churning temperature. Ordinarily, the cream shou be held for at least two hours at the temperature that is to be churned. Butterfat cools very slowly, and less it is held for a sufficient length of time, it will not reduced to the churning temperature, despite the f that the serum may be at this temperature.

Another factor that is of extreme importance in ducing butterfat losses is the richness of the cream. general, it may be said that cream testing from 30 to per cent fat is the most satisfactory, and one that is l prone to produce large fat losses. Thin cream, besi being more difficult to churn, is also more likely to p duce large butterfat losses. This is due to the gr amount of serum present, which is not conducive to haustive churning, and as a result there will be a la amount of buttermilk with accompanying large fat los in the buttermilk.

Seasonal Temperature Changes.

During the winter it is also somewhat difficult churn exhaustively due to the dry feeds which are to the cows which result, very often, in small, h globules of butterfat. A remedy for this, of course, is raise the churning temperature, although care must taken in doing this because if it is raised too much body of the butter will be injured and a slushy prod will result. No definite temperature can be given churning, but in general it will lie between 55 to 60 grees Fahrenheit. Perhaps the only way that the corr churning temperature that will fit the individual con tions is to determine the temperature at which exha tive churning can be made in a period ranging from to 50 minutes. No hard and fast rule can be made reference to the temperature that cream should churned for there are so many factors which enter with different creameries and what might be good one might not hold true in any other creamery.

One point that is common knowledge to every ma facturer of butter, but is very often disregarded, is factor pertaining to the fullness of churn. Usually, reason given by so many in the creamery for loading churn too heavy is that they did not have enough cre for two full size churnings and the time that would lost in splitting the batch and making two churni would be too great. Usually, those who advance t argument find that they could make two smaller chu ings more rapidly than the time that it takes to ch an overloaded churn. In addition to the time elem

Shifting from Wood to

Improve the Quality of Your Buttermilk

and Prevent Wheying Off!

THE addition of a very small amount of good gelatine to commercial buttermilk effects a wonderful improvement. Gelatine prevents wheying off, softens the curd through keeping it finely divided, retards excessive acid, making a smoother, creamier product that will please your customers and bring them back for more.

ESSEX GELATINE

Sx, the Gelatine used by manufacturers of the highest grades of ice cream, is highly recommended for cultured or natural buttermilk. The slight additional cost for small quantity of gelatine used is more than offset by increased sales through highly improved quality.

Let us send you instructions for its use, with a sample and prices.

there is the loss of fat that should be considered in r
ing a large churning. When a churn is filled too
there is too little room for concussion, and as a result
small fat globules do not have an opportunity to u
and consequently they pass off in the buttermilk.
results can be obtained when the churn is filled f
one-third to one-half full.

Fat Losses are of Vital Importance.

The speed of the churn is also important in obtai
exhaustive churning and decreased fat losses in the
termilk. A churn that does not revolve rapidly en
will result in greater fat losses inasmuch as the co
sion is not great enough to cause the smaller fat glob
to adhere. Too great speed will, of course, cause a
creased agitation, for the cream will not fall from
to side of the churn.

Dr. McKay stated: "This loss of fat in buttermi
a very important question that should claim the a
tion of everybody interested in the butter busine
From the figures that Dr. McKay quoted, there is a
proof offered that the loss of fat in buttermilk is
vital to the butter industry. It can "break" the s
creameryman, and to the large manufacturer the l
can reach a staggering sum of money each year. A
checking of the losses that are being suffered from
source should be made, and the manufacturing o
tions followed through to determine the cause of
leak.

* * *

QUANTITY OF MILK BOTTLED AT CITY MI PLANTS.

The accompanying table shows the percentage of
bottled at each of 92 milk plants. These figures
obtained in the course of labor studies made at
plants.

It will be noted that on the average 80 per ce
more of the milk received is bottled. Some of the p
in three of the groups went considerably below
figure, but these particular plants handled a
amount of wholesale milk.

Although many milk plants handle a much sm
percentage of bottled milk than the ones included i
table, the figures given more nearly represent tho
the average milk-bottling plant. Apparently no rel
exists between the size of the plant and the rat
bottled milk to total milk receipts.

Per Cent of Milk Bottled at 92 Representative Milk Plan

Group	No. of gallons handled daily	No. of plants	Aver. total gallons handled per plant	Per cent of receipts bo	
				Aver.	Vari
1	2,000 or less	13	1,407	81.0	70·
2	2,000 to 5,000	21	3,308	88.2	73·

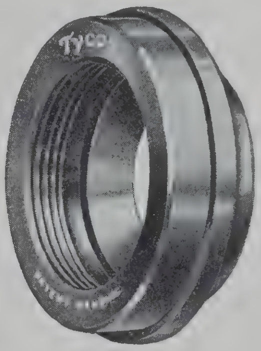
Tycos Industrial Thermometers with Sanitary Ferrule for Milk Lines

The dependability of ***Tycos*** instruments for use in the milk industry is well-known. To further their usefulness and to show a new standard of cleanliness and sanitation, the ***Tycos*** Sanitary Ferrule has been developed and placed on the market. It is another example of the thoroughness with which the ***Tycos*** engineers, with their knowledge of your industry, solve and anticipate your needs.

Tycos Sanitary Ferrule for Applying Thermometers and Regulators to Milk Lines

(PATENTED DEC. 7, 1926)



This Ferrule can be installed on all milk pipe lines. It is furnished for any size tee or cross of I. A. M. D. specifications.

All ***Tycos*** Indicating, Recording and Controlling instruments with connections for this sanitary ferrule are interchangeable in any size of ferrule.

The ***Tycos*** Ferrule has no thread to come in contact with the milk, consequently it offers no dead pocket for the propagation of bacteria. By its use the bulb of the temperature instrument is directly in the milk flow, where true temperature conditions exist.

Write for additional information on the **Tycos** *Sanitary Ferrule and for milk plant calalog No. 500-A.*

Try this
easy Oakite way
of cleaning equipment!

ONE of the toughest jobs in dairy plants is removing hardened casein from pasteurizers. Heretofore, it has meant energetic, vigorous scrubbing, and many concerns have resorted to abrasive cleaners to remove this tenacious casein film.

But there is no need or reason for doing this now. Because Oakite so easily and quickly softens casein and other adherent film or deposits that it can be removed with comparatively little effort. And most important, at LOW COST and SAFELY. Whether for removing casein from pasteurizers, or for cleaning cans, bottles, churns, strainers, or other dairy equipment, the remarkable detergent action of Oakite makes all cleaning EASIER and does work other materials cannot do.

You can get the facts about this remarkable material and its money saving possibilities by writing for the booklet "Oakite in Milk Plants and Dairies", mailed free on request. A post card will do. Write today.

OAKITE IS MANUFACTURED ONLY BY
OAKITE PRODUCTS, INC., 30B Thames St., NEW YORK, N.Y.
(Formerly OAKLEY CHEMICAL CO.)

HOW ONE OPERATOR WENT ABOUT IT TO G
GOOD MILK.

Oregon, Wis., Jan. 30, 1927

Editor The Milk Dealer:

I received your letter some time ago saying that P
C. E. Lee had told you of the improvements that we h
made in the quality of milk and cream received at
creamery.

Regarding sanitation, I do not believe it right
me to insist that the farmers clean up their prem
unless my own plant is in such a condition that it
pass inspection. The first thing I did on taking cha
of the creamery was to clean the entire plant. Sho
after that the Gridley Dairy Company and the Milw
kee Board of Health made an inspection of the cream
and gave it a score of something over 81 points. I
much as 75 is a passable score, I felt very pleased.

Then I began going out on the routes, as 95 per
of all the milk is delivered in that way and the only
to see the farmers was for me to visit them. I m
rather slow progress, due to the fact that my helper
I handle 40,000 pounds of milk daily and cream enc
to churn five to eight thousand pounds of butter a mo
It was possible for me to spend only a few hours
day on my inspection tour. I loaded a can brusher
Wyandotte into my car and started out on my inspec
tour and got very good results, and the hearty co-op
tion of all the farmers I called on.

Later I found that my inspection and lecture
was evidently not thorough enough because when I
sediment tests I could not get the results I expecte
sending out the discs, so I had to cover all the ro
again. I took the sediment test on a certain route
then with their pads proceeded to call on the pat
taking along a strainer and cloth which we secured
the Gridley Dairy Co. I also tried to impress on
farmers the necessity of cooling and stirring their
After this trip the results were very satisfactory.
patron told me that he liked the way we started o
namely, cleaning up the creamery before trying to
the farmers improve their product.

William Rehm of the Gridley Dairy Co. mad
inspection of each farm and aided us materially in
work and the suggestions he made to the farmers
taken very good naturedly.

But still we found that there was more to be
complished as our bacteria would be too high at ti
and as we receive a premium when the bacteria c
is below a certain amount, I got a methylene blue
to assist us. I found that some milk would run up
millions of bacteria while the bacteria count in
milk would be very low. I got one farmer inter
in the methylene blue test and he experimented wi
He cooled one can in water and the other can he c
only slightly, and the result was surprising. The
that was cooled at once, and the pails and str
rinsed with a good disinfectant, stood up 7½ hou
this blue test while the other would neutralize in
hour. Therefore, this proves to us that the whole
lies in about two things—cleanliness and proper co
of the milk.

We expect to have a dinner soon and invite al
farmers to this dinner at which we will demonstra
them what is necessary to obtain good, clean milk.
hope to have Prof. Lee here to assist us in convi
the farmers of the advantages in producing only
milk. We will advise you definitely when this d
is to be held and would like very much to have yo
tend it.

Yours very truly,
H. E. GRIFFIN.

Water

A Blessing and a Curse to Your Business

A Blessing in view of its use to flush and clean machinery, floors, etc. In view of its conversion into steam to heat with, to pasteurize with, to obtain power from. In view of the fact that it represents 87% of milk by volume.

A Curse in view of its presence in the form of condensation on the walls, ceilings, floors, machinery, pipes, belting, etc., with the resultant unnatural depreciation of these things.

In view of its effect on the health of your workmen when they are exposed to a high relative humidity, wet floors, dripping ceilings and cold drafts.

In view of its effect on the quality of your product when it causes mold due to a water saturated condition of the air.

This Curse Can Be Removed From Your Business

Removing the excessive moisture from the air of your plant will effect a tremendous saving in depreciation of building, machinery, pipes and belting. It means more efficiency from your workmen as well as a more healthy working condition. It will help you produce a higher quality product because of improved sanitary conditions.

Knowledge of the types of machinery and equipment used in your plant together with a thorough knowledge of the "handling of air" in milk plants and creameries by the King Ventilating Company's engineers puts us in position to render you a most valuable service.

THE year of 1926 was the greatest year in the history of the Edison Storage Battery Company. Despite its higher initial cost, the Edison Battery stands *first* in volume of motive power and train lighting sales. The provable economy in buying Edison quality and Edison performance is alone responsible. The Edison Storage Battery Company is the largest manufacturer of industrial storage batteries in the world.

Edison Storage Batteries today are standard equipment on nearly two-thirds of all the street trucks, industrial trucks, tractors and mine locomotives in service throughout the country. Lower final costs and constant dependable service have made this record possible.

There is a very unusual booklet containing a full report of ten storage battery cost investigations by the A. C. Nielsen Company, an independent firm of engineering accountants. May we send you a copy? If you are a battery user, it will prove most interesting.

Alert
ew Jersey Dairy
Jumps Sales 19% This Way

CAN you point to this record, made by the Keystone Dairy Co., Hoboken, N. J.:

> *"Finding that Thatcher national advertising had increased public interest in milk from a health standpoint, we decided to use Thatcher Posters on our hundred or more wagons. The result, after one year of these attractive moving advertisements, was an increase in milk sales of 19%."*

Being identified with the celebrated "A Bottle of Milk Is A Bottle of Health" pays. If you are not identified with this popular slogan, you are missing a real money-making opportunity.

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher Bottles that Superior quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown on every Thatcher Bottle for your protection and guarantee. Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

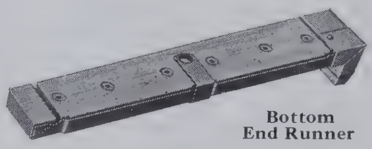
BOTTOM RUNNERS on your BOTTLE CRATES

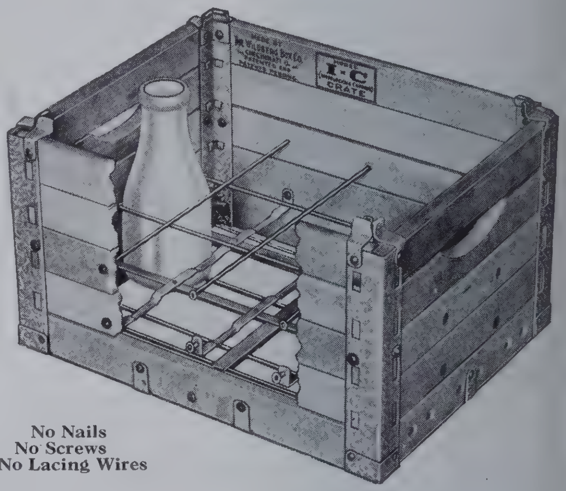
The Bottom Runners on

The MODEL **I-C** (Interlocking Corner) **CRATE** are the only runners on the market which provide the crate with a perfectly smooth surface [with nothing to catch on conveyors or floors], yet at the same time take nothing away from the strength of the bottom slat.

To apply all other runners the manufacturers either wood-work away part of the thickness of the lumber of the bottom slat and weaken it to the point of splitting at the first hard blow it receives, or have numerous rivets, holes for which are bored against the grain of the wood, also greatly increasing the likelihood of splitting and breaking off.



Bottom
End Runner



No Nails
No Screws
No Lacing Wires

Ours is the only Bottom Runner to *actually strengthen the bottom slat,* due to the *Patented Clips that reinforce bottom, inside and outside* of the slat above the bottom row of wires on the ends and above the brace wires on the sides.

And—if you use hand trucks in your plant, you will find that the nose of your truck will slide under the I-C bottom runner at any angle at which it strikes the crate. It won't with most others.

IFORM SYSTEM OF MILK GRADING FOR WISCONSIN.

ıt a uniform system of milk grading should be d in Wisconsin was the general opinion expressed earing held at the request of leaders in the move- for better milk before Commissioner of Markets d Nordman. The purpose of milk grading, ac- g to Mr. Nordman, is to bring about a condition which the consumer will know what he is getting e producer will receive a higher price for superior product. The system should be uniform but not lsory.

the conclusion of the hearing the following com- of seven was appointed to devise a milk grading

th Michels, Department of Markets, Chairman.
H. Bryant, Gridley Dairy Company, Milwaukee.
Wayne A. Munn, Janesville.
C. Burchard, Wisconsin Dairymen's Association.
lo K. Swanton, Madison Milk Producers' Assn.
H. Kramer, Kennedy Dairy Company, Madison.
F. Dineen, Milwaukee Milk Producers' Association.

* * *

PROPOSED SYSTEM OF GRADING TO BE REJECTED.

was decided at a meeting of the department ad- board and Milwaukee (Wis.) milk shippers that ilwaukee health department will oppose changes milk inspection and grading procedure advocated state marketing commission.

e new system of grading would take into account nditions at the farm where the milk is produced, acteriological content and numerous other condi- which Dr. J. P. Koehler, commissioner of public ı, Milwaukee, does not believe materially affect the y of milk.

e new system would cost the city approximately 00 a year for inspection and would result only in crease in the price of milk. There are only ten in the state which are able to make the tests needed the proposed system of grading and the costs of ional personnel for these cities would be prohibitive.

C. A. DESHELL RETURNING TO AMERICA FOR A VISIT.

C. A. Deshell, inventor and former president of the Deshell Laboratories, Inc., Los Angeles and Chicago, and now a resident of Paris, France, is returning for a visit to the United States, arriving early in March.

C. A. DESHELL.

Many connected with the ice cream and dairy business will remember that Mr. Deshell was head and founder of a firm which had branches all over the world, and that he sold his interests, both in the United States and abroad, to the Stirling Products Co.

Recently he has become associated with the Esquimaux Brick organization of Paris, ice cream manufacturers, purchasing an interest and being president and general manager. He explains his mission in the United States as one to purchase additional machinery and equipment, and to raise money to establish his ice cream business more fully. In writing about the possibilities of the ice cream industry in France, Mr. Deshell says: "I am absolutely confident that France is offering wonderful possibilities, for this is absolutely an undeveloped business."

YOUNG MEN, FOLLOW HIS EXAMPLE!

Even in our present high-speed era of living there are to be found outstanding business careers which should inspire the ambitions of every young man.

Francis J. Kullman is an example of this type of career. Mr. Kullman was born June 5, 1871, at Somerset, O., and came to Chicago in 1891, shortly after which he began to work for the Bowman Dairy Co.

From that time to the present, Mr. Kullman has been associated with the Bowman Dairy Co., now located at 4149 South State St., Chicago, Ill.

Mr. Kullman is now vice-president of the company.

"ASSOCIATION CATALOG" OF MACHINERY A SUPPLIES.

Within the next two months the Dairy and Ice Cr Machinery and Supplies Association announces, it pects to have in printed form a directory of associa houses and their products, relating to the whole r of requisites of all of the manufacturing dairy indust

As reported by officers of the association at it cent annual meeting in New York City, preparatio this inclusive directory which will have a circulatio several continents, has been necessitated by the l number of inquiries which regularly come from thro out the dairy products industries concerning source supply for various types of dairy products manufa ing and merchandising materials, equipment, accesso processes, etc.

The association announces that it hopes to be ab supply a copy of this inclusive directory to every sponsible dairy products plant executive throughou United States and Canada, without charge.

CARBONDALE, PA., TO HAVE NEW MILK PLA

Mr. Russell, of The Russell Farm Dairy, Carbon Pa., announced that plans have been prepared for erection of a new and modern dairy plant and that ations will start as soon as the weather conditions permit.

The property recently acquired by the compan ideally located for a dairy on account of the conve switching facilities.

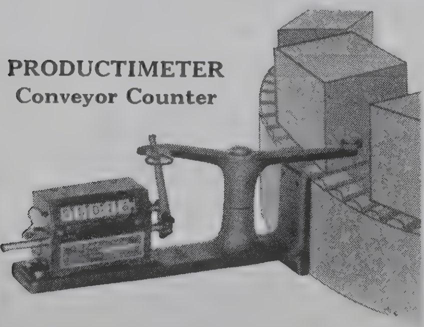
The new dairy will have a frontage of 174 fee Belmont Street and the depth to the Ontario & We Company right of way is about fifty feet, a triang shaped plot, the long sides of which are most sui for the new business enterprise. The dairy and building will be a two-story structure, 30 by 70 The stables and garage will be erected on the rema space.

NORWAY'S MILK PRODUCTION.

Commercial Attache H. Sorensen reports to th partment of commerce that according to semi-o sources the total production of milk in Norway d 1924 was 291,000,000 gallons. Of this total 119,00 gallons were used by the farmers themselves and 000,000 gallons for feeding calves and hogs, 95,40 gallons were sold as milk and cream, 31,800,000 ga for the production of butter, 21,200,000 gallons cheesemaking, and 10,600,000 gallons for condensed making and for other industries.

Since 1924 the production of milk has increased idly and at present it is estimated that the total duction amounts to roughly 330,000,000 gallons.

COUNT 'EM ACCURATELY—BOTTLE or CAS



PRODUCTIMETER
Conveyor Counter

Productimeters recording daily volume on important machines or operations give you an accurate count, in plain figures, quickly and dependably. They tell you at a glance just what has been done in a given period of time; make it easy to figure costs, bottle and case requirements, etc.

Built in various models—to fit washing, filling, sealing machines, conveyors, and to tally bottles, cases, packages, boxes. Our Service Department advises you which model is best for particular applications. Write for the Productimeter Catalog, telling us what you wish to count.

NICIPAL PASTEURIZATION REQUIREMENTS.

A study of 250 municipal ordinances relating to mar- milk, reported as having been in effect in 1925, shows t a wide variation existed in temperature and time re- rements of pasteurization. The maximum and min- m temperatures were 175 and 140 degrees F., respec- ely, a large majority ranging from 140 to 145 degrees The time varied from 30 minutes to momentary ex- ure (flash). A 30-minute holding period was pre- ibed in approximately 80 per cent of the ordinances.

In 39 ordinances pasteurization temperature require- nts were not stated, and 40 prescribed no definite ding time. A large majority of the cities which did state pasteurization requirements had a population 25,000 or less.

In several instances an ordinance allowed two, three four different combinations of temperature and time pasteurization. Such regulations, however, were te rare, the tendency being to prescribe but one defi- e temperature and holding period.

The following table gives the temperature and time uirements found in the ordinances studied. In the rch letter similar tables will be given for various pop- tion groups.

unicipal Requirements for Temperature and Time of Milk Pasteurization (1925).

	Number cities	Average time	Maximum time	Minimum time	Time	Number cities	Average temperature	Maximum temperature	Minimum temperature

KROHA WINS AWARD.

In a recent contest, sponsored by the John P. Smith inting Co., Rochester, N. Y., for the best essay on rect mail advertising, George F. Kroha, advertising nager of the Pfaudler Co., was awarded first prize th his essay, "Direct Mail, the Dominant Motivating rce in Modern Selling."

It was pointed out by Mr. Kroha that direct mail ad- rtising "looms as the most powerful single influence modern selling and daily shows further instances of right to an equal share with its running mate—maga- e advertising. These two allies are working in close rmony and making advertising history in many com- nies today. Magazine advertising is busy getting in- iries—and direct mail advertising is converting these quiries into orders."

The contest was judged by Frederick C. Kendall, edi- r of "Advertising and Selling," New York, and the ize carried a cash value of $50.

WN FINE MILK PLANT IN MARSHFIELD, ORE.

H. W. Sanford and Ellis Selander operate one of the est milk plants in the Bay region. The plant is thor- ghly modern in every respect.

For Covering Pipe

DISCRIMINATING plant owners are rapidly learning that wherever there are cold pipe lines it pays to cover them with

Mundet Jointite TRADE MARK Cork Pipe Covering

Cork is ideal because of its remarkably low heat transmission, its natural waterproofness, its limitless life, and low cost of installation. It is a very simple matter, with the half sections of perfect-fitting covers, to PROPERLY insulate many more feet of pipe per day with cork than is possible with any other covering.

Our Practical Refrigerating Engineers cover the entire United States. They will gladly help you with any cold insulation problem. No obligation whatever. We manufacture, sell and install complete.

L. MUNDET & SON, Inc.
Hillside, - New Jersey
Established 1865
New York Office: 461 Eighth Ave.

Also Manufacturers of Jointite Pure Cork Board for all cold insulating purposes.

The New Mark Hopkins Hotel, San Francisco, Cal., nearing completion. Mundet Jointite Cork Pipe Covering was used throughout on the cold pipe lines and fittings.

CALIFORNIA MEN PLAN FOR 1927 SHOW.

Oakland, Calif., Feb. 1, 1927.—Several meetings of dairy industry people from all parts of the Pacific Slope were held at the Hotel Whitcomb, San Francisco, January 24 and 25, inclusive. This gathering brought together the membership of the Pacific Slope Dairy Show Association, California Dairy Council, State of California Milk Dealers' Association, a committee of the California Creamery Operators' Association and the joint committee on California dairy development.

Preliminary plans for the seventh annual Pacific Slope Dairy Show were made by the membership of the association. The dates were tentatively set as November 14 to 19, 1927, inclusive.

The organization returned the same officers and directors as last year with the exception of three new directors, namely, C. O. Hagen of Los Angeles, A. J. Cowell of San Francisco, J. R. Murphy of Fresno. The officers and directors are as follows:

Dr. C. L. Roadhouse, Davis, president; Albert Meister, Sacramento; Robert E. Jones, Oakland; D. M. Dorman, Los Angeles; Geo. E. Platt, Los Angeles; A. Jensen, Los Angeles; P. H. Davis, San Anselmo; Frank M. Helm, Fresno; Emile J. Etienne, San Francisco; Wm. M. Regan, Davis; E. A. Green, San Francisco; Geo. W. Prising, San Francisco; W. E. Haley, San Francisco; C. E. Gray, San Francisco; Geo. R. Frampton, Artesia; Sam H. Greene, San Francisco; M. H. Adamson, Los Angeles; J. W. Coppini, Ferndale; R. A. Condee, Chino; J. J. O'Neil, Oakland; F. J. Bowden, Hanford; J. N. Gilman, San Francisco; C. O. Hagen, Los Angeles; J. R. Murphy, Fresno; A. J. Cowell, San Francisco.

The annual report of Secretary-Manager Robert E. Jones was received. It showed that the 1926 show was the most successful in its history, not only in attendance and exhibits, but also financially. A surplus of $3,000, income over expenditures, was indicated by the financial statement.

A total of 100 new life members have been added during the year, making a grand total of 200 life members.

President C. L. Roadhouse announced that he expected to spend a year of study in Europe, and will be leaving about the first of May. Vice-President W. E. Haley of San Francisco was directed to act as executive head of the show during his absence.

The secretary-manager made a complete report on his activities in the East Bay district, where he has been acting as "peacemaker" in an effort to settle the differences between Oakland milk dealers and the Co-operative Dairymen's League. This report brought out considerable discussion, and the secretary-manager was authorized to continue his work and report to the executive committee at a later date.

The committee on California dairy development was appointed jointly by the California Development Association and California Dairy Council. Its purpose being to outline a plan to bring more dairymen to California. Members are: Geo. R. Frampton, Los Angeles, chairman; R. N. Wilson, Calif. Development Assn., San Francisco, secretary; O .W Jarvis, Sacramento; E. C. Gordon, Prof. E. C. Voorhies, University of California, Berkeley; C. E. Gray, San Francisco; J. R. Pickett, editor Pacific Rural Press, San Francisco; T. R. Brice, Los Angeles, and Robert E. Jones, Oakland.

This committee held its organization session. It was generally agreed that the parts of California which offered opportunities for dairy development were the Sacramento and San Joaquin Valleys, and that the committee's energy should be directed to further settlem of these areas.

It was voted to name a sub-committee to prepar list of reasons why California offered opportunities dairymen from other states The secretary was instru ed to get in touch with land companies having eith completely equipped dairy farms for sale or which w willing to erect dairy buildings on their lands and of the complete plant for sale. It was brought out t there are many applications for dairy farms, but th is a shortage of farms and also of cows. The commit then adjourned to meet again shortly at the call of chairman.

Milk Dealers Elect.

At the state of California milk dealers' meeting following officers were elected:

President, D. M. Dorman, Los Angeles; 1st vice-pr ident, W. E. Haley, San Francisco; 2nd vice-preside Frank Helm, Fresno; secretary-treasurer, C. A. Fieweg Oakland.

Practically the entire session was devoted to the cussion of the advisability of a publicity campaign acquaint the consuming public with the meaning of word "Pasteurized." It was brought out that this wo is considerable of an enigma to the housewife. The m ter was left in the hands of the board of directors to f ther develop the act.

The association voted to provide a fellowship at University of California, College of Agriculture, Da (dairy industries division) in the amount of $800.00 year. This grant was accepted by Dr. C. L. Roadhou on behalf of the University, with warm thanks.

A legislative committee of the California Creame Operators' Association, composed of Fred Abbott, sec tary; T. E. Day, San Francisco, and C .L. Mitchell of Angeles held a brief session to discuss legislative matte

Profound sorrow prevailed at all of the meetings to the sudden death of E. F. Moran, attorney for State of California Milk Dealers' Association and San Francisco Milk Dealers' Association, and a life me ber of the Pacific Slope Dairy Show Association. Re lutions of sympathy were adopted and the visitors, well as home people, attended the funeral, which held Monday, January 24.

GOLDEN RULE FOR BUSINESS.

To visualize the aim of the California dairy indust a code of ethics was adopted at the last meeting of California Dairy Council. Here, in brief, are its sali points:

California Dairy Council Code of Ethics.

To take pride in our business.
To produce and handle dairy products of high quality.
To place California Dairy Council foremost among business activities.
To believe in California Dairy Council as the heart the industry.
To strive to correct abuses and unethical practices in business.
To treat alike both old and new customers.
To guarantee the same price, quality and service to
To strive to retain the good will of our own and our c petitors' customers for the benefit of the industry
To recognize the right of the producer to a fair price his product.
To apply the golden rule to every transaction.

It's the EXTRA Years of Service that return the big profits on Conveying Equipment

Note the features briefly described at the right. There are some of the important reasons why

LAMSON SANITARY CONVEYORS

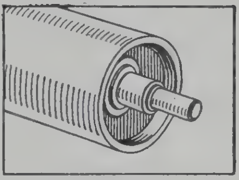
last longer

There, too, are some of the reasons why these modern labor-saving devices are easier to keep clean—provide continuous, trouble-free service—soon pay for themselves in any milk plant.

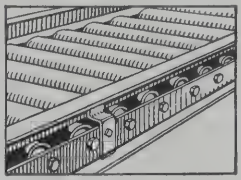
Send us the coupon — let it bring further information that shows why so many prominent plants are Lamson Equipped.

THE LAMSON COMPANY
SYRACUSE, N. Y.

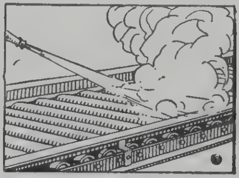
LAMSON
SANITARY
CONVEYORS



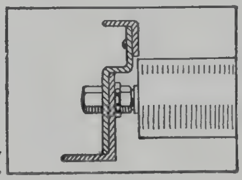
1 *Moisture can't get in.* Corrosion comes with moisture. Keep moisture out and you prevent corrosion. Lamson Rollers extra-heavy throughout, have heads *welded in.* No joint through which moisture can enter. No inside corrosion. Remember that.



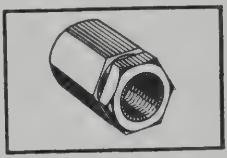
2 *Special guard rail over roller ends.* This heavy angle iron guard rail, setting in over the ends of the rollers, prevents can-chimes from dropping off and blocking the conveyors. *And this saves wear.* Sliding cans over rollers that can't turn wears out the rolls and the cans, both. The Lamson conveyor never stalls or blocks.



3 *Stands up under flushing and steaming.* Turn the hot water on it as often as you please. Steam it often as you want. You can't harm the bearings, you can't force any moisture into any part where it will be harmful. Lamson has designed this conveyor to stand a limitless amount of cleaning.



4 *Practical mounting.* The frame is so designed that it forms a cup-like protection to keep moisture and milk away from the shafts and bearings. This mounting maintains dryness of the moving parts, even in conditions where a great deal of moisture is present. It adds greatly to the service of Lamson conveyors, and helps to prevent rolls from sticking.



5 *Non-corrosive bearing of special design.* The bearings are cast of non-corrosive alloy. They are extremely resistive to all corrosive action. They are hexagonal in shape, so inserted in the frame that they can never turn with the shafts. Consequently they cannot freeze, and always operate.

The Lamson Co.,
Syracuse, N. Y.

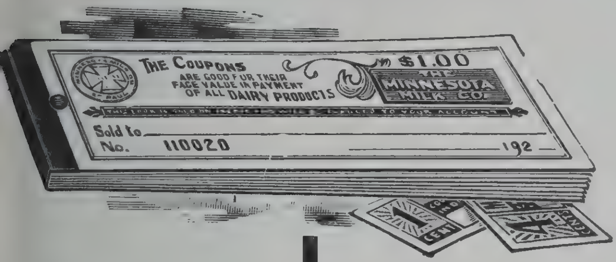
Are National Dairy Coupons a Success?



THE COUPONS
ARE GOOD FOR THEIR FACE VALUE IN PAYMENT OF ALL DAIRY PRODUCTS
$1.00
THE MINNESOTA MILK CO.
Sold to
No. 110020
192

They reduce customer turnover.

They increase sales.

They wipe out the bad debt item.

They simplify collections and reduce drivers' working hours.

They avoid disputes with customers and consequent lost accounts.

They concentrate purchases through your regular routes.

They solve the problem of handling transient accounts.

They simplify accounting records.

They cost very little to use.

They can be used for all products regardless of price changes.

Users will be glad to tell you how National Dairy Coupons have overcome many of their greatest business problems.

They have pulled many a milk dealer out of a rut through the ability of National Dairy Coupons to put his business on a *cash basis.*

Think what it would mean to you if you could have the use of cash now tied up in customers' accounts. Then add to this one dollar a customer for advance payment on National Dairy Coupons.

Is the prospect of releasing and raising that amount of capital not worth the small cost of trying out National Dairy Coupons?

You will find encouragement in the success of users. Let us tell you about them.

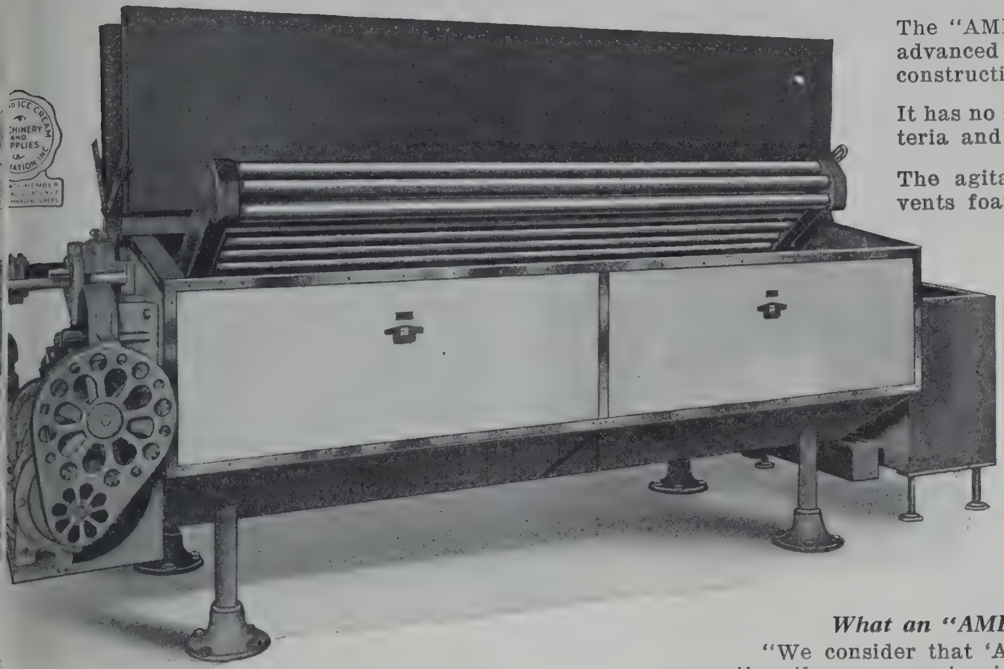
AMERICO” THE PASTEURIZER WITH A PURPOSE



The new “AMERICO” with improved coil control

The “AMERICO” embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an “AMERICO” User Says:

“We consider that ‘AMERICO’ is nearer perfection than any pasteurizer we have ever used.”

HUNDING DAIRY COMPANY
HUNDING'S BEST MILK

Since 1880—

We have been making special dairy wagons and truck bodies built to order.

Guedelhoefer Wagons for milk delivery are not only built with every detail of good looks and advertising qualities in mind, but also with the one thought of sturdiness and practicability.

Representative users in the milk industry have shown their approval of Guedelhoefer quality through repeat business for years.

The new Guedelhoefer Silent Wagon

These new Guedelhoefer low down milk wagons have
Timken Bearings and Rubber Tires
That Outlast Steel!
They handle large loads conveniently, silently and with extremely light draft for the horse.

Let us tell you more about these wagons and their cost.

THE POLK SANITARY MILK CO.

Regular Style

John Guedelhoefer Wagon Co., Inc.

202-220 Kentucky Ave. Indianapolis, Indiana

NO OTHER THING

can make a cleaner of more value to the Dairyman, Creameryman or Cheesemaker than the fact that its superior qualities are uniform and dependable and barrel for barrel will perform the same consistent sanitary service.

This dependable, superior service has been performed for over twenty years and is being performed today by

Wyandotte
Dairyman's
Cleaner and Cleanser

It isn't any wonder then that every day the demand for this unequalled cleaner increases.

Moreover, its thousands of users are proving beyond doubt that Wyandotte Dairyman's Cleaner and Cleanser is also the most economical cleaner for the dairy industry.

NEW MILK CODE ACCEPTED BY DAIRYMEN OF LEXINGTON, KY.

The Lexington Dairymen's Association, Lexington, Ky., at a special meeting, endorsed and accepted the proposed milk ordinance, as modified at a recent conference of the City Board of Health and a committee appointed by the association.

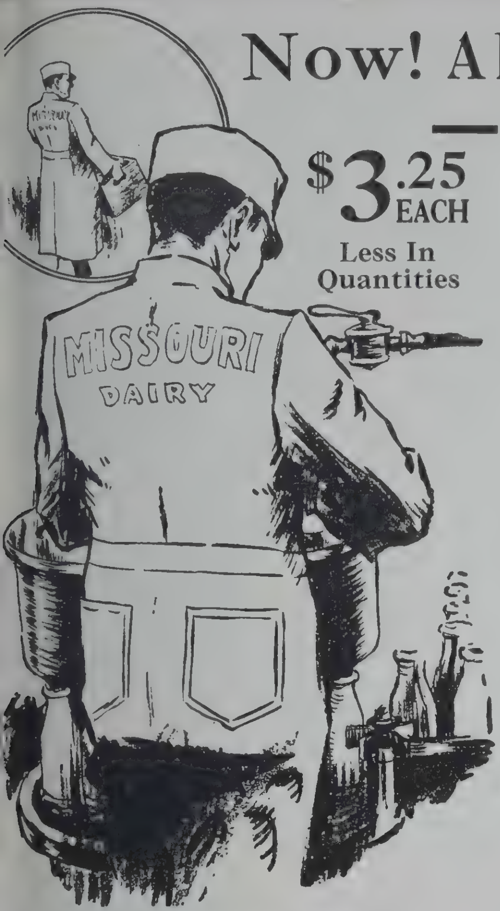
The revised ordinance next goes to the Board of City Commissioners, which is expected to give it favorable action at an early date.

The original ordinance provided that all milk be classified in three grades, A, B, and C, depending o bacterial count and standardized equipment neces for its production. Pasteurization was to be empl to improve the quality of the lower grades.

Instead of allowing the raw milk to be advanc grade by pasteurization, as set out in the original nance, the draft was modified at the last conferenc tween the board of health and the dairymen's commi so that raw milk could not be raised in grade by teurization process.

Prof. W. S. Anderson is president of the associa

Now! ALLOVA Garments in New Fabrics —*Stronger and Heavier*



$3.25 EACH

Less In Quantities

We have waited three years to make this announcement. Meanwhile, one of the finest cloth mills in the United States has been working diligently in our behalf, perfecting an overall cloth made according to our own standards and specifications.

And now it's ready! The Allova Work Suits, Work Coats and Caps you buy after March 1 will be made of our new material, with the name "Allova" at frequent spaces along the fabric. Thus you can identify the genuine "Allova Cloth."

These new fabrics are eight-ounce cloths, closely woven, and stronger, heavier, longer wearing! In order to guard against the inevitable shrinkage, we cut all garments oversize, and make them two inches longer than ordinary work clothes. Measure an Allova Suit against an ordinary work suit and see for yourself!

These precautions make Allova Work Clothing the outstanding value for the money—in comfort, in service, in long-wearing satisfaction!

Yes, Sir! These new Allova Work Garments are built for real service—"he-man" suits and coats, made in attractive colors, and lettered with the *individual name, trademark or monogram of the wearer!* Advertising that walks and talks!

Workmen take a new pride in their appearance and the appearance of the premises, when they are outfitted in Allova Garments. Snappy uniforms give an air of "class" to any place of business—and yet cost but little more than nondescript, shabby overalls.

Sturdy, one-piece, Allova Garments wear long and well. Cut big and roomy. Every seam stitched to stay. Pockets reinforced with double thickness of material. All buttons covered. Your choice of many colors: solid blue; solid white; solid khaki; blue and white striped; blue and khaki striped. Sizes 34 to 56.

$3.25 Each—*for Suits or Coats*

12 Suits or Coats	**$3.00** each
25 Suits or Coats	**2.88** each
50 Suits or Coats	**2.75** each

Sizes 46 to 56 are 10% additional.

Caps .... **40c** each

One Suit or Coat FREE with each dozen ordered at above price.

Your dry goods, department or clothing store can supply you ALLOVA suits at the above prices. If not, order direct from the Motor Suit Manufacturing Company.

We embroider names, trademarks or monograms in fast colors for 25c per garment. Choice of any color embroidery. 24 to 72 hour service.

Order Allova Work Garments from your Jobber.

ASSOCIATION NOW HAS 3,350 MEMBERS!

According to the announcement of C. E. Hough, ge eral manager of the Connecticut Milk Producers' Ass ciation, that organization has made a marked increase membership, volume of milk sold, a slight improveme in the average price of milk, and a very marked improv ment in the morale of the membership and standing wi the trade that purchases their milk.

The association now has a net membership of 3,3 Connecticut milk producers and the volume of busine in 1926 represented by their members at wholesale mi values was twelve million dollars. Ten million dolla of this milk was sold by contract through the associ tion and the remainder was sold either to small deale without contract or retailed by those who produced

Several resolutions were passed at the annual me ing, namely, one endorsing an area T. B. test law f Connecticut, another to continue support of the Connec cut Dairy and Food Council during 1927, another endo ing the sale of their milk by the pooling, or classifi plan, as well as several others on other subjects.

The following officers and directors will guide t affairs of the association during 1927: Robert C. Mitch president; Charles P. Viets, vice-president; George Harris, secretary, and J. Arthur Sherwood, treasur B. B. Norton, Cheshire; Philo T. Platt, Bethel; C. Pomeroy Willimantic; John Rankl, East Hampton; L. Thompson, Woodbury; George W. Treschman, Midd field; C Daniel Way, Andover; W. L. Wetmore, Winst Lester E. Williams, Northford; R. J. Averill, Washingt Depot; Jacob Beisegel, Woodbridge; S. McLean Bu ingham, Watertown; G. A. Collins, Broad Brook; C. Fieneman, Farmington; A. H. Gardner, Middletown; Samuel Gillette, Bristol; H. A. Healey, Seymour; Ned Kendall, Granby; Chas. N. Le Geyt, Barkhamsted; T man B. Miller, Farmington.

MANISON ANNOUNCES RESIGNATION.

G. N. Manison announces his resignation as prod tion manager of the Pfaudler Co. of Rochester, N. and advises he has joined the ranks of the Nickel F ricating Corp., with headquarters at Philipsburg, Pa. the capacity of manager of that firm's New York off

The many friends of Mr. Manison will be pleased hear that he has entered the sales field, and officials the Nickel Fabricating Co. have expressed confide that Mr. Manison's long experience will be a real vantage in his new work.

MIDDLESBORO MILK PLANT OPENED.

The most modern equipment available has been stalled in the plant of the Middlesboro Sanitary M Co. at Middlesboro, Tenn. The company expects to s be in a position to take care of a large trade. The p cipal owners of the business are W. S. Jaynes of T well, Grant of Tazewell, and W. G. Meador of Horrog

According to the present plans of the company, W Meador will be manager of the plant.

NORTHFIELD PLANT TO BUILD ADDITION

Plans have been completed for an addition to Northfield plant of the Twin City Milk Producers' A ciation, St. Paul, Minn., to be used as a sweet milk buttermilk drying unit. An accumulation of 40 pounds of skim milk necessitated the action.

The new addition will be 42 by 42 feet and machin will be installed to take care of from 40,000 to 80 pounds of milk daily.

Ice and Moisture Can't Harm a SEALRIGHT CAP

HOLSTEIN DAIRY
BUTTE, MONT.

1. The New Sealright Liftright Cap. Patented groove makes it easy as ABC to insert finger nail under tab and remove cap in a jiffy.

WM. J. BURBECK
COMPANY

2. The Improved Sealright Pouring-Pull Cap. Has same patented groove as new Liftright Cap. Opening in Cap for pouring or inserting straws. Ideal in home, school and restaurant.
3. Sealright Regular Standard Cap. The best and biggest selling regular standard cap in the world.

DEARY BROS.
DB
MILK

Note: The special Sealright Process drives hot paraffine into every fibre

NO milk user likes a soggy, leaky, delapidated cap on opening a bottle of milk. Such caps are unsightly, unsatisfactory. Sealright Caps protect you and your customers against such bugbears.

By a special process, which assures perfect sterilization, hot paraffine is driven into every fibre of the world-famous Fulton Board from which Sealright Caps are made. This treatment, plus the natural toughness of the Spruce made Fulton Board, makes Sealright Caps impervious to ice or moisture. They have the strength and firmness to resist the most severe conditions.

Sealright Caps print clear and bright. Uniform thickness and clean cut edges insure a perfect, liquid-tight seat in bottles as well as perfect operation in capping machines. There is a Sealright Cap for every need. (See illustrations and descriptions at left.)

And Sealright Caps are nationally advertised and nationally preferred. No wonder it pays to use them. Write today for *Free Samples* of the three greatest caps in the dairy industry.

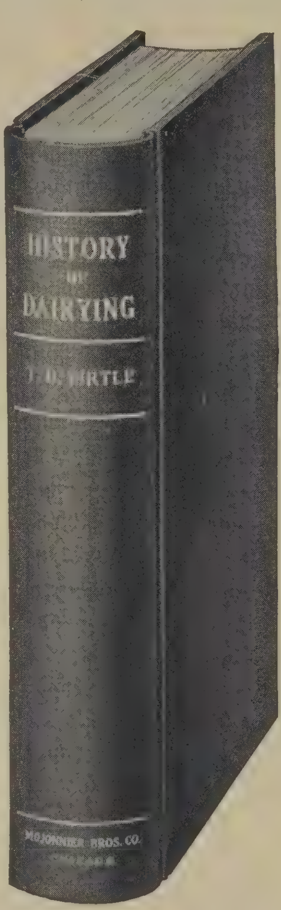
THE HISTORY OF THE DAIRY INDUSTRY.

A CONTRIBUTION to dairy literature of outstanding importance is the new book, "The History of the Dairy Industry" (of the world), published by Mojonnier Bros. of Chicago, just off the press.

The author of the book, T. R. Pirtle, assistant marketing specialist, bureau of agricultural economics, U. S. Department of Agriculture, Washington, D. C., has used exceptional brevity in treating each subject, and at times he covers many years in a single paragraph or sentence.

Few authors have attempted to handle a subject so broad and intricate covering all countries and reaching from the beginning of written history to the present time, and it is especially difficult as the dairy industry is so full of technical phases and has an ever changing application of great scientific discoveries. The undertaking is stupendous.

The book opens with a general resume of dairying in all countries, swinging rapidly from one country to another, briefly and connectedly picturing the cattle and dairy products, methods, trade, extent, and peoples of each country and bringing it connectedly down to the present time. In a word, showing the world trend in dairying down through the ages and its present status.



It is divided into five chapters: 1, United States; 2, Europe; 3, Australia, New Zealand and Asia; 4, Africa; 5, South America, Mexico, Central America and West Indies.

The book covers more than 600 pages and is profusely illustrated, having more than 200 pictures, covering various breeds of cattle, and prominent buildings, in foreign countries, and of interest in the United States. The pictures bring up many new points.

The style of the book follows an outline, giving first a picture of the natural conditions of the country and people, a picture of the cattle, then a picture of the development of cattle, and industry, with the extent of the industry at the present time closing the written portion. This, however, is followed by a table of the chronological events of the country and the statistics, with some special references.

Each country is treated singly but it is handled in such a way that there is practically no repetitions in the book.

Possibly the most interesting feature is the recording of the development of breeds of cattle, the methods of feeding, care and breeding, all to no purpose until the breeds were established and standardized, then the progress became permanent. This is followed by the cow testing associations to further develop the breeds of cattle and increase the milk yield and this in turn is followed by the co-operative association work to economize in the handling and selling of the product.

The chronological events are tabulated at the end
each country to show the trend and time of various pe
ods of development and the agents to which they w
principally due. An international table is also giv
which shows the trend of the world, placing the eve
in order of time regardless of country of origin. T
table is a new departure and corrects many false i
pressions and will be a great saving of time as a rea
reference.

The facts are noted often without a hint of the e
nomic urge behind them and yet they are usually c
nected in such a way that the reasons are visible with
giving the "ready-made" impression.

The general impression of the book is to make
feel that he has visited the countries and become
quainted with the people, the cattle and the industry.

The vast quantity of information brought toget
in this volume has been possible only by the autho
connection with the U. S. Department of Agriculture
many years. The author's connection with the dairy
dustry for years gives the weight to the volume and
doubt it will have a large place in the dairy indust

⚜

DETERMINATIONS OF FREE CAUSTIC IN PR ENCE OF OTHER ALKALIES BY MEANS OF TH NAFIS AUTOMATIC CAUSTIC TEST.

By M. E. Parker.

The analytical methods employed by the Nafis Au
matic caustic test as originally designed and descri
in a past issue have been found to be limited to
analysis of detergents containing caustic soda and s
ash (sodium carbonate). A modification developed
the result of recent research permits the analysis
washing compounds and detergent solutions contain
caustic soda in the presence of other alkalies such
tri-sodium phosphate, silicates, carbonates or alumina
This development gives this apparatus greater uti
for it can now be used for the determination of cau
soda in the presence of any other alkali or alkalies.

The new technique is as follows: Fill the dou
scale burette to zero. Add approximately 10 c.c.
saturated solution of barium chloride to the meas
sample by means of the measuring pipette. A w
flocculent precipitate will be formed. Add 3 drop
indicator No. 1 to the mixture, which will render
mixture a deep pink. Add neutralizer to mixture s
ly with constant stirring. Continue the titration u
an end-point is reached comparing with the color st
ard for indicator No. 1 contained in the stirring
The point on the "T" scale gives the percentag
caustic soda directly. Refill the burette to zero.
indicator No. 2 to the mixture. This will render
mixture a deep yellow. Run out neutralizer from
burette into the mixture with constant stirring.
tinue the titration which dissolves the precipitate
an end-point is reached comparing with the color st
ard for indicator No. 2 contained in the stirring rod.
fore end-point is reached, the mixture becomes a
solution. The reading on the "T" scale divided by
gives the percentage of residual alkali as soda ash.
reading on the "T" scale is added to reading obta
with indicator No. 1 in the first titration to give the
centage total alkalinity as caustic soda.

This modification is a technique developed from
well known analytical method of C. Winkler.

a real Soaker-Hydro at a price you can afford!

TO grow! To make more money! That's the ambition of every progressive dairy owner. *And right there's where the R & A Little Soaker-Hydro fits into the scheme of things.*

It gives the smaller plant the same type of bottle washing equipment that larger plants use, at a fraction of what the bigger machines cost.

It provides all the advantages of combined soaking and hydraulic washing methods—made exceptionally effective by the way the machine is designed.

It supplies a strong selling argument to use in soliciting new customers — "the most modern type of bottle washing equipment that the market affords." And, best of all, right back in your plant, the Little Soaker-Hydro will be living up to the best you can say about its performance!

It guarantees, through its utterly simple, tremendously strong construction, that your bottle washing difficulties are definitely at an end. It will give you 365 day a year service for years into the future with a minimum amount of maintenance and expense.

It is compact—16 feet long, slightly over 6 feet high. It is easy to install, easy to care for; and is so carefully designed that *only one safety-stop is required on the entire machine.* Three rows of pockets are always ready for loading. Feed and automatic discharge at one end of washer.

Every piece of metal, every mechanical unit in its construction is the best that money can buy for the purpose. One 5 H. P motor operates the entire machine, including the pumps.

Two sizes: 4 wide—32 bottles per minute; 6 wide—48 bottles per minute. Chlorinating attachment can be added if desired.

This is the kind of bottle washer you should have in your plant! Let us give you complete information with exact prices. The obligation will be all ours.

M-W Milk Can Jackets

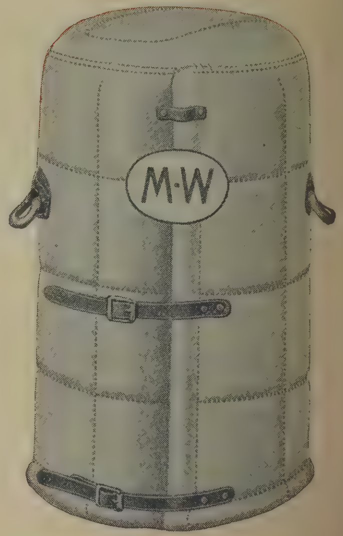
Protect Milk, Sweet Cream and Ice Cream Mix from extremes of temperature while in transit, insuring shipments arriving in good condition.

Increase your sales by reaching new territory and add to your profits by eliminating adjustments caused by shipments spoiling.

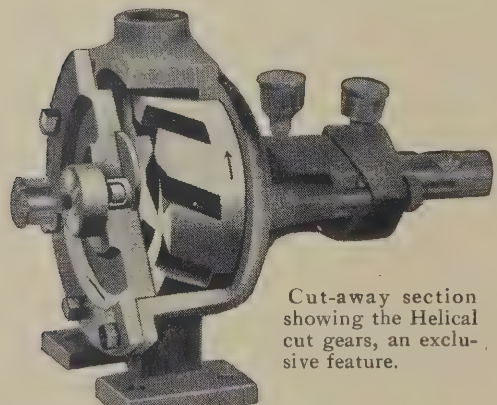
Milk or cream shipped in "M-W" Jackets is kept at a temperature that complies with requirements of the Health Authorities. Their use will please your customers.

Made by the manufacturers of the original
"M-W" Iceless Delivery Jackets
"The Jacket That Defies Heat"

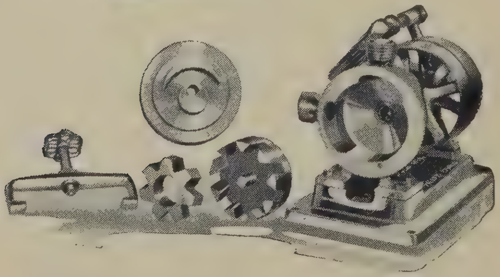
Montgomery - Washburn Co., **Saugerties, N. Y.**



The Perfection Rotary Pump



Cut-away section showing the Helical cut gears, an exclusive feature.



The Perfection Rotary Sanitary Pump
(Disassembled)

Note the extremely smooth inside finish and the accessibility. Open pockets, easily cleaned. Note, also, that there are only two moving parts, the internal gear rotor and the pinion. The rotor is supported by a bearing on both sides.

The Pump with the Shearing Cut

THE teeth of the rotor in the Perfection Rotary Pump work like a pair of scissors on an angle instead of head on like so many splashing buckets. Because there is no shock or strain it runs more smoothly and delivers a uniform flow.

It is the ideal pump for milk or cream because the smooth running helical gears prevent excessive churning. And it is a **real sanitary pump.**

Made in Iron or Bronze, finished in gray enamel. Bronze pumps nickel plated if desired. Capacities 8 to 90 gallons per minute. Industrial types for water or brine. Mounted on base with tight and loose pulleys or with reducing gear for individual motor.

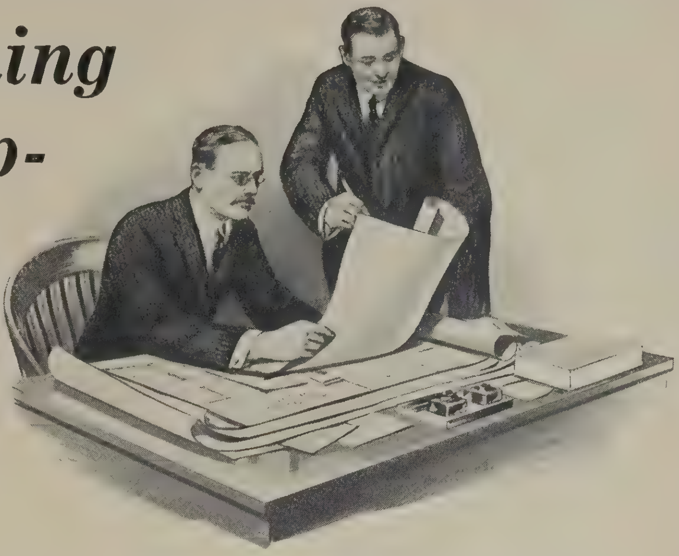
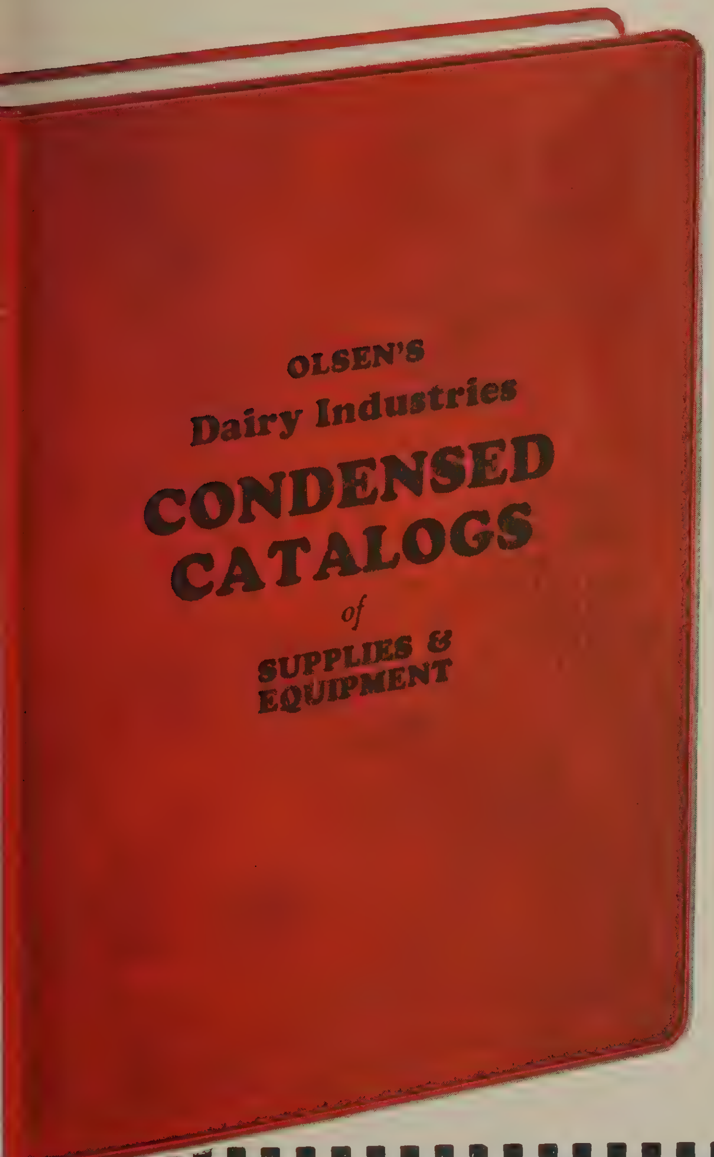
hen You Are Planning Build, or Buy Supies and Equipment



NO matter what you need in machinery or supplies, you can find detailed information on the products of the best and largest manufacturers and suppliers in *Olsen's Dairy Industries Condensed Catalogs.*

Here in one heavily bound book, you will have complete *data and specifications* in standardized form of every important article or service used in the manufacture and distribution of butter, ice cream, milk, cheese, evaporated and powdered milk, etc.



A DATA BOOK for Your Desk

Always within reach, *Olsen's Dairy Industries Condensed Catalogs* is a valuable reference volume. It is completely classified and cross-indexed — a room full of individual catalogs condensed into one large book.

Every purchasing agent and buyer in the Dairy Products Industries should have a copy of this important and helpful book. It will be sent out on a registered loan basis only, free of charge, to be recalled each year and replaced with a new copy.

Olsen's Dairy Industries Condensed Catalogs will be completed within a few months. To reserve your copy, write a letter on your business stationery, stating your position. You will then be sure to receive a copy early, free of charge.

COTTAGE CHEESE RECIPES.

(Continued from page 32)

Variations.—To utilize leftover cereals use one cup of cooked rice, oatmeal or corn meal mush with ¾ cup of bread crumbs.

Dry corn meal or finely ground oatmeal may be used for stiffening the mixture above, but in such case it is better to form into a loaf and bake it in the oven about 25 minutes.

Other seasonings may be used in place of those shown above.

The quantity of liquid will vary in every case. The mixture should be very stiff, as the cheese tends to soften it during the cooking.

Suggested breakfast menu. — Orange or grapefruit; cottage cheese sausage; corn bread or toasted Victory bread; coffee. For a heartier meal, include creamed potatoes.

* * *

Cottage Cheese Loaf No. 1.

1 cup cooked rice (dry and flaky).
1 cup cottage cheese.
½ cup ground peanuts.
1 cup bread crumbs (or more).
1 tablespoon chopped onion.
1 tablespoon savory fat or drippings.
¼ teaspoon soda.
1 cup strained tomato.

Mix well and form into a roll. Brush over with melted butter and bake in a moderate oven 25 minutes. Serve with a medium white sauce to which may be added 2 tablespoons minced pimientos.

* * *

Baked Bread and Cheese.

4 medium slices of bread, or 2 cups cold cooked rice (dry).
1 egg.
1 egg yolk or an egg white.
2 cups milk.
¼ teaspoon salt.
Cayenne pepper.
Butter.
1 cup cottage cheese.
¼ teaspoon soda.
½ teaspoon onion juice.
Parsley and pimiento, or piccalilli or chili sauce; nuts if desired.

Butter the bread and cut the slices in squares or triangles. Place a layer, buttered side down, on the bottom of a large shallow buttered baking dish. Dissolve the soda in a little of the milk, and with it mix the cheese to a soft cream. Add parsley and pimiento or sauce if desired. Spread a thick layer of the cheese lightly over the bread, and cover with the rest of the bread, buttered side up. Beat the eggs well, mix them with the milk and seasonings, and pour them over the bread. Bake in a slow oven till a knife blade thrust into the custard comes out clean. If the milk is heated and added gradually to the beaten egg, and the baking dish is set in a pan of hot water, the custard cooks more quickly and is less liable to curdle through becoming overheated.

Variations.—Corn muffins, barley or oatmeal bread may be used instead of white bread. This dish may be made into a hearty sweet pudding by omitting the onion juice and other seasonings, and substituting two to three tablespoons of sugar, or an equivalent sugar substitute, and raisins or dates, nutmeg or cinnamon, with other spices if desired.

Supper or luncheon menu. — Baked bread and cheese, green salad or crisp fresh vegetable, toasted corn muffins, coffee or Russian tea. fresh or canned fruit. For a heartier meal add baked or hashed brown potatoes.

* * *

Cottage Cheese and Potato Croquettes.

1 cup cottage cheese.
2 tablespoons chopped parsley.
1 rounding teaspoon chopped green pepper.
¼ teaspoon soda.
½ teaspoon salt.
Dash of cayenne.
Dash of paprika.

Mix these ingredients very thoroughly and form into small rolls. Then embed the rolls in mashed potatoes which have been seasoned with salt and pepper, forming a larger roll of each. Roll the finished croquettes in egg and bread crumbs and fry in a pan containing about one tablespoon of hot fat, or brush with melted fat and brown in a hot oven.

* * *

Hashed Brown Potatoes with Cottage Cheese.

Chop cold boiled potatoes fine and season them well with salt, pepper, and onion juice. Turn upon a hot frying pan lightly greased with savory fat, and cook the potatoes slowly without stirring till they are browned next the pan.

Meanwhile soften a generous quantity of cottage cheese with cream or milk till it will spread easily. Mix with it any desired seasoning, such as chopped parsley or pimientos, a little leftover ham or bacon, chili sauce or piccalilli, and spread it over the potatoes. Let the mixture stand long enough to warm and soften the cheese; then fold over the potatoes, like an omelet, turn it upon a hot platter, and serve at once.

Many persons enjoy the slight acid flavor of the cheese with this dish. If desired, however, the acid of the cheese may be neutralized by adding ¼ teaspoon or more of soda for each cup of cheese.

Suggested supper menu. — A little cold meat, thinly sliced; hashed brown potatoes with cottage cheese; salad; tea or coffee; warmed-up corn muffins; apple or berry pie.

* * *

Creamed Potatoes and Cottage Cheese.

Reheat cold diced or sliced potatoes in medium white sauce with cottage cheese. The best seasoning for this sauce is a slice of onion added to the milk while heating and chopped parsley and pimientos; ⅔ cup of potatoes and ⅓ cup of sauce make a generous serving.

Boiled new potatoes may be served whole with this sauce.

* * *

Cottage Cheese Dressing.

½ cup milk.
¼ cup vinegar (not too strong).
1 egg.
1 cup soft cottage cheese.
1 cup sour cream, whipped.
1 teaspoon salt.
1 teaspoon mustard.
½ teaspoon paprika.
2 teaspoons flour.
1½ teaspoons melted butter.

Method.—Mix the dry ingredients together and cream them with the melted butter. Add the creamed mixture to the heated milk and stir until very thick. After the mixture has boiled, add vinegar slowly, stirring all the while. Cool slightly and add beaten egg. Put the cottage cheese through a sieve if necessary to break up lumps. Using an egg beater, beat the cottage cheese gradually into the dressing until smooth. Lastly fold whipped cream into dressing.

* * *

Fried Bread With Cottage Cheese.

Spread slices of stale bread thickly with cottage cheese, with which pimientos, nut meats, or some marmalade or jelly has been blended. Dip in a mixture of egg and milk, and fry quickly in butter or other fat.

Variation.—The egg and milk may be omitted, and the bread may be fried lightly in a very small quantity of bacon fat.

Cottage Cheese Pie.

- 1 cup cottage cheese.
- ⅔ cup sugar.
- ⅔ cup milk.[1]
- 2 egg yolks, beaten.
- 1 tablespoon melted fat.
- Salt.
- ¼ teaspoon vanilla.

Mix the ingredients in the order given. Bake the pie in one crust. Cool it slightly and cover it with meringue made by adding two tablespoons of sugar and ½ teaspoon of vanilla to the beaten whites of two eggs and brown it in a slow oven.—New York State College of Agriculture.

[1] One tablespoon of cornstarch stirred smoothly into the milk will prevent the custard from separating in the oven.

* * *

Old Dutch Cheese Cake.

The rule is the same as that for the filling of the cottage cheese pie, except that the milk should be reduced to ½-cup, two tablespoons cornstarch should be used, and the flavoring usually is of lemon juice and rind with mace or nutmeg. White corn sirup may be substituted for part of the sugar if the milk is reduced in proportion. Bake 25 minutes in a moderate oven, or until brown. This makes a very firm custard.

* * *

Spiced-Cheese Pudding.

- 2 slices stale bread.
- 2 eggs.
- ½ teaspoon salt.
- 1 cup milk.
- 1 cup cottage cheese.
- ¼ teaspoon soda.
- ½ cup sugar.
- ¾ cup seeded raisins.
- ½ teaspoon allspice.
- ¼ teaspoon mace.
- ¼ teaspoon cloves.

Cut the bread into cubes and place in a greased baking dish. Beat the yolks and whites of the eggs separately. Blend with yolks the milk, salt and sugar, and cheese, to which the soda has been added. Add the spice and chopped raisins and lastly fold in the stiffly beaten whites. Pour this mixture over the cubes of bread and bake like a custard in a moderate oven.

If desired the white of one egg may be beaten separately, sweetened wih one tablespoon of sugar, and spread over the top of the pudding just before removing it from the oven.

Corn muffins or cold rice cooked dry and flaky may be substituted for bread.

* * *

FOUR SANDWICH SUGGESTIONS.

Cottage cheese, tomato, lettuce and mayonnaise dressing.

Spread layer of cottage cheese and then layer of jam generously on brown bread.

Grind few stuffed olives, add two tablespoonfuls walnut meats; blend with one-half pound cottage cheese and mayonnaise to taste.

Hard boiled egg, ground; cottage cheese, mix with salt and mayonnaise.

* * *

COTTAGE CHEESE-RAISIN SANDWICH.

Raisins, dates or prunes softened by soaking and then mixed well through cottage cheese and spread on Boston brown bread makes another delicious sandwich filling.

* * *

COTTAGE CHEESE OMELET.

A luncheon dish that's different. Two eggs beaten separately; to yolks add two tablespoons milk and two tablespoons ground pimentos, one-half teaspoon salt, and two heaping tablespoons cottage cheese; fold in egg whites. Cook in frying pan with one table-

This Gasket makes all lids fit like new!

Don't throw away perfectly good cans or lids because of a few dents—use **Paterson Vegetable Parchment Gaskets.** They make all lids fit like new and prolong the life of every can. Millions used yearly by leading milk shippers.

But that is not all! Parchment Gaskets save hundreds of dollars worth of "spilled milk and cream"; they prevent churning of cream in the lid and help keep the bacterial count where it belongs.

Parchment Gaskets are easy to use. They come cut to size in packages of 1000. **Soak them thoroughly in clean water,** place over neck of the can and jam down the metal cover.

spoon butter; brown on top in oven. Serve hot.

* * *

COTTAGE CHEESE-NUT SANDWICH.

Chopped nuts and cottage cheese, to which a little mayonnaise has been added; mixed well and spread on thin slices of graham bread make a delicious sandwich.

* * *

COTTAGE CHEESE CLUB SANDWICH.

Toast three slices of bread on one side only. Butter and cut in triangles. On the untoasted side of two triangles spread cottage cheese thickly and dot with jam. Lay two more toast triangles on, and on these lay strips of crisp bacon, a slice of tomato and a bit of cress or lettuce, and spread lightly with mayonnaise. Put other two triangles of toast on top and serve with garnish of dill pickle and ripe olive.

* * *

COTTAGE CHEESE PINEAPPLE SALAD.

On a nest of lettuce leaves place a slice of pineapple. Heap cottage cheese in the center and cover with mayonnaise or whipped cream. A dash of paprika adds much to the appearance of the dish.

* * *

COTTAGE CHEESE IMPERIAL SALAD.

Mix chopped pecans with cottage cheese, form into balls, roll them in finely chopped nuts, and place in cavities of pears. In forming cheese balls add pinch of cornstarch to each ball and they will shape much easier. Serve on lettuce leaves with either French dressing or mayonnaise and garnish with strips of pimento.

* * *

COTTAGE CHEESE PIE.

Line a deep pie plate with pie crust, and add the following: Three well-beaten eggs, one cup cottage cheese, one cup of shredded cocoanut, nine tablespoons of sugar, one teaspoon of nutmeg, two cups of milk or enough to fill the pie plate. Bake as you would custard pie, being careful to reduce the heat to prevent it becoming watery.

* * *

OLIVE AND NUT SALAD.

To a cup of ground olives and a half-cup of nut meats chopped fine, add one pound of cottage cheese combined with mayonnaise. Heap on crisp lettuce leaves and garnish with mayonnaise—topped with stuffed olives.

* * *

COTTAGE CHEESE RAREBIT.

1 cup cottage cheese
1 tablespoon butter
1 egg
4 tablespoons skim milk

Put cheese and butter in saucepan, add pepper, salt and a dash of mustard to taste, then add milk and egg; stir until cheese melts. Pour over hot buttered toast. Do not heat very long, as cheese will become stringy.

* * *

COTTAGE CHEESE FRUIT COCKTAIL.

1¼ cups cottage cheese
¼ cup diced pineapple
¼ cup diced orange
¼ cup shredded dates
1 tablespoon sugar
½ cup whipped cream
juice of one lemon

Mix the diced fruit, sugar and lemon juice together. Fill sherbet glasses quarter full, add heaping tablespoon cheese and fill with fruit, top with whipped cream and add a maraschino cherry.

* * *

STUFFED CELERY.

Cut small can pimentos very fine and mix with one-half pound cottage cheese. Add mayonnaise to taste. Spread on celery, arranging three slices of stuffed olive on top.

TOMATO AND COTTAGE CHEESE SALAD.

Choose medium sized tomatoes, peel and slice very thick.

Drain well and wipe each slice. On top of each slice put a thick layer of cottage cheese mixed with chopped green pepper. Cover all with French or mayonnaise dressing and serve on lettuce. Pimento may also be chopped in with the cheese.

* * *

CELERY AND CARROT SALAD.

To two cups of cottage cheese mix one-half cup of raw carrots and one-half cup celery minced or ground. Pile on lettuce leaf. Add tablespoon of mayonnaise and dash of paprika. Serve with brown bread.

* * *

COTTAGE CHEESE SUNDAE.

To a serving of cottage cheese, pour over it sweetened, crushed fresh fruit. Jam makes a lovely combination. Serve with crisp wafers.

* * *

COTTAGE CHEESE GOLDEN WEST SALAD.

Drain and chill halves of peaches. Place halves on hearts of lettuce and fill centers with chopped celery, salted almonds and cottage cheese with which mayonnaise has been mixed. Garnish top of each with a dash of mayonnaise and a whole almond.

* * *

STUFFED EGGS.

To the yolks of three hard boiled eggs, add three tablespoons cottage cheese. Season to taste with salt, pepper and mayonnaise. Fill cavity in egg whites, letting stuffing mound high. Garnish with fine strip of pimento laid lengthwise.

* * *

COTTAGE CHEESE TEMPTATION

12 slices bread
¼ teaspoon salt
¼ pound cottage cheese
1 large green pepper
1 can condensed tomato soup
6 teaspoons butter, pinch of pepper

Trim crusts from bread and spread one side of each with cottage cheese. Place two slices together with unspread sides out. Put three tablespoons of butter in frying pan, brown the sandwiches on both sides in it. Remove to platter and keep hot. Then melt one tablespoon butter in same pan, add green pepper, seeded and chopped fine and cook until it is tender. Add tomato soup, salt, pepper, and pour over the sandwich. Sprinkle the top with cottage cheese and serve hot.

* * *

COTTAGE CHEESE CAKE

1 pound cottage cheese
½ pint whipped cream
1 cup sugar
3 eggs
2 tablespoons flour
vanilla

Beat these ingredients to a smooth paste. Line a bake tin about two inches deep with a crust made of one package of zweiback rolled to a flour, mixed with one-half cup melted butter, three-fourths cup sugar, one teaspoon nutmeg and cinnamon mixed. Fill this crust with the first mixture, and cover top with some of the crust sprinkled over. Bake in slow oven until the filling is firmly set.

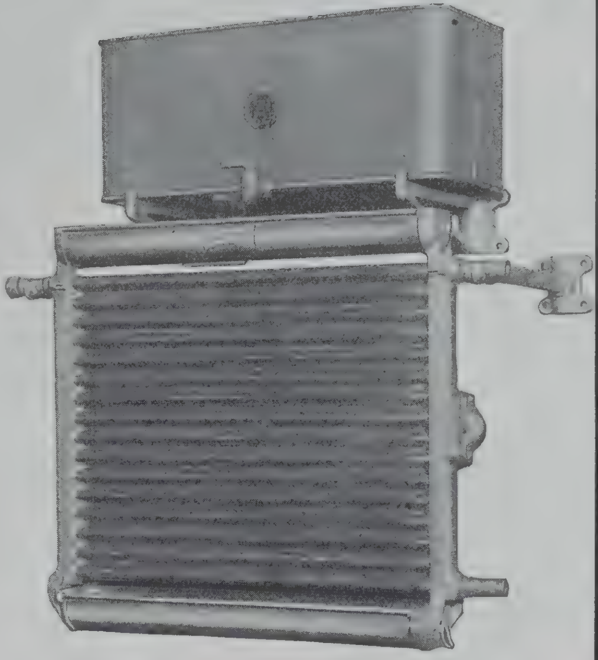
Many progressive milk dealers are buying Bestov Farm Coolers IN QUANTITIES



If you endeavor to maintain a high quality standard for your bottled product, it is necessary to work with your producers and encourage them to supply clean, sweet milk.

Warm weather is approaching and proper cooling methods on the farm will be imperative.

Why not take a constructive part in this cooling problem, as many progressive dealers are? Furnish your producers with the finest type of dairy cooler made—there are several ways of getting them in use throughout your country district, and there are many advantages for you to have efficient, sanitary coolers in use.

Bestov Farm Coolers are built of copper and bronze to last a lifetime. They are easy to keep clean and to use. Brine or spring water or both under pressure, may be used. Built just like the coolers in your own plant, they cool milk down to within a degree or so of the cooling medium.

Guaranteed
against
a pressure of
150 Pounds
water or brine

Several capacities are offered with or without pump, stand, reservoir, covers, etc. A BULLETIN will give you all details. Ask for a copy from your nearest DAIRY SUPPLY HOUSE —or direct to Cherry-Bassett Company, manufacturers of Bestov equipment for handling milk products.

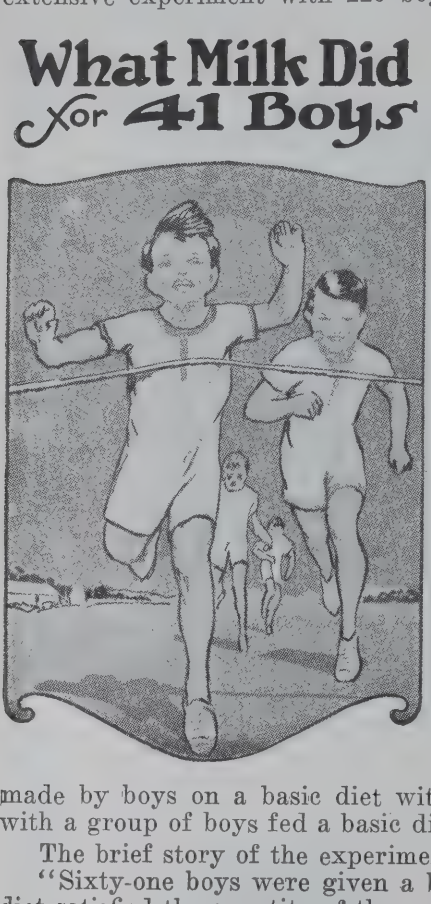
ENGLISH EXPERIMENT ON VALUE OF MILK IN BOYS' DIET PRINTED IN LEAFLETS FOR MILK DEALERS.

Experiments showing the food value of milk and the growth and health promoting qualities of nature's nearest to perfect food have been conducted with animals for a good many years in America.

However, doctors who have been studying undernourished children and the lack of proper diet among children in industrial sections of London, England, decided a few years ago that the best means of teaching parents the proper value of foods and of impressing upon them the value of dairy products was to outline an extensive experiment with 220 boys, covering a period of four years. The results of this study of child diet have just been published in leaflet form by the National Dairy Council, Chicago.

This leaflet, small enough to make an excellent enclosure with statements sent by milk dealers or for special mailing to their customers or prospects, has been regarded as so important that several thousand of them are now available from the National Dairy Council. It is called "What Milk Did for 41 Boys" and contains a brief story of the experiment, along with charts showing the rapid gains made by boys on a basic diet with milk, as compared with a group of boys fed a basic diet only.



The brief story of the experiment is as follows:

"Sixty-one boys were given a basic diet. The basic diet satisfied the appetite of these growing boys and **apparently** was all that was needed. During the first year these boys increased in height 1.84 inches and gained an average of 3.85 pounds.

"Another group of boys, forty-one in number and as nearly like the group of boys fed the basic diet as possible, were fed a pint of milk a day in addition to the basic diet. As a result their gain in height was 2.63 inches and their gain in weight 6.98 pounds. In other words their increased gain in height, because of milk, was 42 per cent, and their increased gain in weight, because of milk, was 81 per cent over the basic gain.

"The basic diet varied from day to day and consisted of selections from the following: Potatoes, bread, beef, pork, herring, kipper, sausage, dumplings, cabbage, beets, beans, peas, porridge, "Hoosh," lettuce, molasses, sugar, cheese, cocoa (containing a total of two to four ozs. of milk daily), margarine, jam, raisin suet pudding, rice pudding and cake.

"It is to be noted that no preference was shown in selecting the groups of boys. They were as evenly balanced as was possible to make them. The entire experiment was planned and conducted under the supervision of the Medical Research Council, under the Privy Council of England.

"The differences in gains were the result of the fo and nothing else, inasmuch as the housing conditi were the same for all the children, their activities w the same, and the same factors prevailed in all cas except with respect to food.

"Apart from the marked gain in weight and heig which is shown by the boys who are receiving the ex milk ration, there is also a general improvement in th physical condition.

"There was absence of illness during the winter 1923 and 1924 among the boys with the milk ration, though in other houses in the village the sickness r has been somewhat higher than usual.

"After eighteen months observation a casual visi entering the dining hall where the boys of ninete houses sit at table would never fail to recognize the ta of that house which was alone receiving the extra rati of milk, the boys of that house being obviously more than those of any other house."

We are informed that dealers may secure these le lets in any quantity at cost prices by writing to the N tional Dairy Council, 910 S. Michigan Ave., Chica More than half a million of them are being printed national distribution.

* * *

RATES RULED REASONABLE.

In a report to the Interstate Commerce Commissi Examiner Bronson Jewell states that commodity rates canned goods and canned milk from Central and Illin territories to New Orleans, Memphis and other points the lower Mississippi Valley are neither unjust nor reasonable. The rates were assailed as unjust and reasonable in complaints filed by the National Canne Association and the Carnation Milk Products Compa The report reads in part as follows:

Nominally the complaint in No. 17776 brings in issue rates on canned goods from all points in Central and Illin freight association territories to the Valley, but the evide was directed to the general level of rates under attack not toward the question of the proper relationship of ra within the originating territories. Accordingly this rec affords no basis for a disturbance of this present adjustm or, for the same reason, any change in the existing relati ship between points in the territory of destination. U these questions no opinion is expressed in this report.

The commission should find that the rates assailed canned goods, including canned milk, in carloads, from poi in Illinois association and central territories to Mempl Tenn., New Orleans, La., and other points in the lower M sissippi Valley are not unjust or unreasonable.

Upon consideration of the record the former finding t the rates from Middleton should not exceed the contem raneous rates from Madison by more than two cents sho be reaffirmed. The commission should further find that rates from Richland Center, Chilton, Berlin, Sparta and Nei ville, and any other points no further distant, figuring m ages through Madison where less than through Chicago, and for the future will be unreasonable to the extent t they exceed the contemporaneous rates from Madison a Milwaukee to the same destinations by more than eight ce per 100 pounds; and that rates throughout the balance of territory here considered are not unreasonable or otherw unlawful.

An appropriate order should be entered.

* * *

THE REASON WHY.

Little Freddie, an only son, was having a childish ar ment with Billy, youngest of a neighbor's family. The cussion seemed to be about which of the two was the bet fighter. Billy, thus far, had the advantage of the word bat

He said: "Why, Freddy, you're seven years old and can't lick Buddy Gordon; and I'm only six and I've lick him twice!"

Freddy was silent for a few seconds, then exclaim "Yes, but the milkman brings you four bottles of milk a us only two!"

The DUMORE-JUNIOR Bottle Cleaner

To the milk plant operator we offer this highly developed and highly efficient, modern bottle cleaner. We are the originators of the only successful out-of-the-case bottle-cleaning machinery. We pioneered the Dumore milk bottle cleaner. Over 350 of these are now in use.

The Dumore Junior, which has been in use for over 10 years, is a typical Meyer product. It embodies all the well known Meyer bottle-cleaning principles, and offers the same dependable service as its big brother—the Dumore Bottle Cleaner. The machine illustrated here, equipped with pre-rinse loader, is made in two sizes, and delivers 24 to 60 clean bottles per minute.

And we guarantee that every bottle is bacteriologically clean!

Dairy and Ice Cream Machinery and Supplies Association Inc.
Associate Member National Association of Ice Cream Manufacturers

The Dumore Junior should be in your plant! It can give you a quality and amount of service that will exceed your greatest demands. We can confer with you and offer you the services of our experienced dairy plant engineers. Write for Bulletin B-36, and we will be glad to send you complete information regarding all the practical advantages of the Dumore Junior.

MIKE THE MILKMAN

MILK BOTTLE STORIES

Milk bottles tell me stories and secrets, yes they do, revealing inner natures of people, through and through! I may be just a driver who makes a morning drive, but you can bet my brainlet is very much alive. One woman on her doorstep leaves bottles sleek and clean; day after day no dirt-streaks are ever, ever seen. That woman is a dandy as mother and as wife; her husband and her kiddies must have a happy life! Another leaves the bottles with curdled milk inside, a place for germs to gather, and speculate, and hide. I'm sorry for HER husband, and for her kiddies too; she's slovenly, I'll warrant, and careless, through and through! Another places bottles in orderly array, and is as prompt as taxes, the very best of pay. I'll bet her home is nifty, I'll bet it's spick and span; if hubby minds his knitting he'll be a wealthy man. Another drops her bottles at random, here and there. She's inexact in business, her husband needs a prayer; her money must go slipping the great toboggan plank; she does not watch her pennies—I hope that I am frank! Another KEEPS the bottles, some two or three per week. She may not be dishonest, but has a scad of cheek! She takes them to the grocery and turns them in for tea, and feels she's cute as Cupid and much too sleek for me! Poor soul! Her kids, I'm certain, will learn that mother steals, so shout a might "ditto," and tackle crooked deals! Yes, bottles tell me stories, they whisper in my ear, they tell me who is honest, they tell me whom to fear; they tell we who is shiftless, and who is prompt and neat; they tell me who's an angel, they tell me who's a cheat! By harking to the stories that bottles have to tell, I serve my boss, I'm certain, one hundred times as well!

⚜

ANNUAL LOSS OF MILK BOTTLES ESTIMATED AT $15,000!

Members of the Superior Milk Dealers' Association, Superior, Wis., are optimistic as to the results of their campaign to round up and keep a check on all lost milk bottles.

According to President G. H. Davis, the annual loss from bottles unrecovered in Superior is placed at over $15,000, which is a staggering loss for the business in that vicinity.

MUNICIPAL TUBERCULIN TEST REQUIREMEN

Milk Inspector Letter No. 112, Bureau of Dairy Indust

With the development and increased accuracy of t tuberculin test as applied to dairy cattle for the det tion of tuberculosis, sanitarians and health officials ha advocated its use as one of the desirable features co nected with the control of municipal milk supplies.

A study of milk ordinances of 250 American cit shows that both the large and the small cities appre ate the value of this test. The following table giv a summary of the tuberculin test requirements of th cities.

As shown by this table, 69, or 27.6 per cent, of t city ordinances studied required that all milk, wheth sold as raw milk or to be pasteurized, should be fr tuberculin tested cows.

Many ordinances require that all milk sold to t consumer as raw milk be produced from tubercu tested cattle, permitting milk which is to be pasteuriz to come from nontested cattle. One hundred and eigh eight, or 75.2 per cent, of the cities have this provisi It will be noted that a greater percentage of the cit in the two largest population groups require that r milk be from tuberculin tested cattle than do the cit in the smaller population groups.

Sixty-two, or 24.8 per cent, of the cities studi make no mention in their ordinances regarding the berculin test. A big majority of such cities have a p ulation of 50,000 or less. In this tabulation certifi milk requirements are not included. The tuberculin t for cattle is one of the requirements for certification milk no matter in what locality it is produced.

Tuberculin test requirements for market milk in 250 citie

Population group	Cities requiring tuberculin test				Cities stating requirements		To cit
	All milk*		Raw Milk*				
	No.	Per cent	No.	Per cent	No.	Per cent	
500,001 and over	1	10.0	10	100.0	0	0	1

ALFRED PURE ICE CREAM COMPANY BUILD ADDITION.

The Alfred Pure Ice Cream Co. of Los Angeles, Ca are constructing a new addition to their plant wh will be equipped for the making of condensed milk, b ter and cheese. A mill, which will have a daily out of 10,000 pounds of milk powder, will also be instal according to the announcement of M. U. Alfred, g eral manager of the company.

The new creamery addition and improvements expected to cost $150,000.

⚜

VALUE OF THE MILK CROP.

It has been brought to our attention that the valu the milk produced in this country last year was grea than that of all the gold and silver mined in the Uni States during the past twenty years.

OUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

139 NORTH CLARK STREET, CHICAGO

Whatcom County Dairymen's Association Plant at Lynden, Washington

Plants in Operation — 7 Under Construction

BECAUSE WE GUARANTEE:

FURNISH A MARKET FOR ALL SKIM-MILK POWDER MANUFACTURED ON OUR PLANTS.

COVERY EQUIVALENT TO 100% OF SOLIDS IN THE MILK.

PRE-CONDENSING NECESSARY.

OM LIQUID TO SOLID IN 30 SECONDS,
and deposited in barrels or containers immediately as manufactured. The low heat and short time the milk is exposed to heat insures highest grade of powder, readily soluble in cold water.

LY ONE MAN NECESSARY TO OPERATE PLANT.

ONOMY IN FUEL, LABOR AND POWER,
compared to other processes, makes it possible to pay for one of our plants in from one to three years.

Write today for booklet describing the Douthitt Milk Powder Plant

When writing to DOUTHITT ENGINEERING COMPANY *please mention The Milk Dealer.*

ANTICIPATIONS OF AN ALERT MILK DEALER.

While one of our staff reporters broke in upon the even tranquility recently of the busy morning routine at the Gabel Creamery Company of Detroit, Mich., a little lesson in forethought was taught which might be a suggestion for some other company entering the milk business who some day hopes also to enter the butter business.

The question was put to C. F. Sielaff, of why a dairy company, operating 137 wagons and catering to 38,000 customers, should be named a "creamery" and not a "dairy." He answered that future plans were laid for going into the butter business and that it would save changing the name of the company at that time.

The thought came to Mr. Sielaff that serving 38,000 customers with milk, cream and cottage cheese, ought to be a very legitimate reason for also serving them with butter on certain days of each week. He has investigated the possibilities of companies as far away as Maryland who are buying Minnesota butter and distributing it on their milk routes and he has decided that if Maryland dairies can make money serving their customers with Minnesota butter, that the Gabel Creamery, located much closer to Minnesota, can also do the same. It is managers like this who are a real value to a firm.

Ground has been purchased adjoining their plant of 100x300 feet and it is the plan some day to build an addition and to manufacture their own butter.

THE ADVANTAGES OF ROOF INSULATION.

By John E. Gray, Sales Engineer, Federal Asbestos a Cork Insulation Company.

Our present era of prosperity is carrying with i very noticeable era of efficiency and conservation. Co petition in every line of business is causing all industr and investment projects to conserve in every manner means possible.

Up to very recent years, little consideration has b given to the great waste of energy due to the conduct of heat through roofs. The roofs of industrial buildin office and store buildings, institutions, etc., represent erally millions of square feet of radiating surface, all ing valuable energy to escape and be dissipated into atmosphere.

At present, however, progressive architects are spe fying some form of roof insulation. It remains only the builder to realize that roof insulation is a sound vestment to cause the insulation of roofs to be a univ sal practice.

The fuel saving due to roof insulation represent return which more than justifies the investment. It also possible to save on the original cost of the heati system, as less radiation is required in an insula building.

Condensation of moisture on the underside of an insulated roof is a very common condition in c weather. An ordinary roof conducts heat so rapidly t the underside presents a surface that is much colder th the air within the building. As the warm air strikes t cold surface, it contracts and drops its moisture. T "sweating" is objectionable in nearly any building, a is very detrimental in many classes of buildings, such textile mills, paper mills, etc. Nearly any case of "swe ing" can be remedied by proper insulation.

Insulation greatly reduces the rate of heat flow, the by causing the temperature of the ceiling or wall to more nearly that of the inside air.

Warm weather benefits are also many. Investigati have shown that insulation, by keeping a plant at cooler temperature has increased plant efficiency by per cent. This is due to the increased comfort of t employees. Roof insulation makes the top floor of office building just as comfortable and valuable as a of the lower floors.

A good insulator should be primarily a poor c ductor of heat. It should further be a permanent, lig weight material, capable of resisting moisture. It shou be low in cost and fire-resisting. The ease with whi it can be applied is also a factor to be considered.

There are many insulating materials on the mark at the present time. Some are applied in a plastic for There are several fibrous materials applied in sheets rolls. There is corkboard, a cellular material applied sheets.

A builder who does not adopt roof insulation is act ally passing up an opportunity of making an investme that will pay a larger return than the building as whole. He is giving his competitor an opportunity gain an advantage over him.

AMERICAN FAMILY SHOULD SPEND 30 PER CEN OF FOOD BUDGET FOR DAIRY PRODUCTS.

According to Dr. E. V. McCollum, of Johns Hopki University, the American family should spend thirty p cent of its food budget for its dairy products. Th now spend only twenty per cent.

The Dairymen's Slide Rule

A Little History Pertaining to the Invention of the Slide Rule.

By B. I. MASUROVSKY, Consulting Dairy
Chemist and Technologist

The Dairymen's Slide Rule is a derivative of the engineer's side rule and the history of the latter will apply in so far as the logarithmic scales are concerned.

Modern computation owes largely to John Napier (1550-1617), Baron of Merchiston, Scotland, who invented a table of logarithms and gave it to the world in 1614. This invention was welcomed by England and the European countries on the continent. The invention of the engineer's slide rule is based upon logarithms and the first interpretation of logarithms to the slide rule was made by Edmund Gunter (1581-1626), Professor of Astronomy in Gresham College, London. In the year 1620 he designed the logarithmic "line of numbers" which is simply a straight line with the digits 1, 2, 3 . . . 10 arranged upon it from one extremity to the other and in such a way that the distance on the line from the end marked 1, to the figure 2, is to the distance from 1, to any other number as the logarithm of 2 is to the logarithm of that other number. In other words, distances along the line were not taken proportional to the numbers on it but to the logarithms of those numbers.

The first invention of the straight edge slide rule was made by Edmund Wingate and explained by him in several publications, the earliest of which appeared in 1630.

The slide rule was used much more in England, during the 18th century, than in Germany or France.

It is not generally known that Sir Isaac Newton ever referred to the slide rule or discovered how it could be used in the solution of numerical equations. For that reason the following translation of an extract from a letter of Oldenburg to Leibnitz, dated June 24, 1675, may be of interest:

> "Mr. Newton, with the help of logarithms, graduated upon scales by placing them parallel at equal distances, or with the help of concentric circles graduated in the same way, finds the roots of equations. Three rules suffice for cubics, four for biquadratics."

The "runner" is claimed to be the idea of Newton, as the first to have thought of such an attachment to the slide rule.

It was not until about 1850 that a French army officer in Metz, then only about nineteen years old, designed a straight slide rule with a "runner" and with a disposition of the logarithmic scales, such as experience has shown to be admirably suited to the ordinary everyday uses of a slide rule. This officer was Amedee Mannheim (1831-1906) and his slide rules are known everywhere as Mannheim rules. Not until 30 or 40 years after its invention did it come to be used in England and the United States.

Great activity has been shown during the last forty years in the direction of perfecting the mechanical execution of slide rules. In America celluloid rules were introduced and being sold by Keuffel and Esser as early as 1888. The Keuffel and Esser are still improving on the slide rule and stimulate the use of same in high schools as well as in colleges.

The Dairymen's Slide Rule has logarithmic scales adapted for figuring dairy problems. It also bears an interpretation of the American Standard Babcock Formula on a straight edge rule. This makes the Dairymen's Slide Rule a standard device for computations and its history is that of the Mannheim Slide Rule described above, except the additional dairy scales which will be described in a later article.

The Dairymen's Slide Rule is patented by B. I. Masurovsky, Consulting Dairy Chemist and Technologist. It is manufactured by the largest manufacturers of high grade slide rules, to be sure of uniform accuracy.

CALIFORNIA FOLKS MAKE MERRY AND PLAN BIG.

On Tuesday evening, January 4, the Southern California Milk Dealers' Association met at a dinner in the banquet room of the Los Angeles Creamery Cafeteria, Los Angeles, for the purpose of installation of officers and to enjoy a little social intercourse and addresses by various speakers. There were about one hundred present including members of the association, executives of various creameries and salesmen. Everybody was in a happy mood and a lot of jokes were passed around prior to the dinner hour which was scheduled for six o'clock. The call for the opening of the evening's entertainment, however, did not occur until six twenty when President R. D. Weaver asked everybody to take seats at the table and the trouble began.

I say trouble, there was trouble for some of the guests, and joy for others. It was found necessary to raise funds for the purpose of passing cigars around to the crowd so the fertile mind of President Weaver conceived the idea of introducing the End Man at the first table and requesting that man to introduce his next neighbor which procedure was carried clear round the room. But when an introdution was made in an inaudible voice or could not be heard across the room the man who was remiss in this respect was fined fifty cents. The inimitable and retiring, modest Robert St. John Gardner of the Jersey Farms Dairy volunteered to collect the fines and proceeded to do so. Bob claimed to have kept count of all fines collected which amounted to $12.00 which he immediately turned over to the incoming president, Ed. Sullivan, who after counting the money, however, claimed there was $1.50 short. Ed. being Irish, and Bob Scotch, there was immediately started a very warm debate as to where the money had gone. The question is still ''up in the air'' as to what became of the $1.50. The debate between Bob and Ed. provided much merriment for the crowd and it is still a matter of doubt whether or not all the fun that was produced by this pair originated in a milk bottle!

After the dinner was finished President Ross D. Weaver addressed the meeting in a serious vein and expressed the satisfaction over the progress made in bringing together those engaged in the dairy industry and the better understanding there was between them. But Mr. Weaver forgot, or rather was too modest to even hint at the splendid service he has rendered in the office for three years, and his splendid conduct of the affairs of the association and his kindly manner in helping to settle disputes. He leaves office with the respect and affection of all those who have been associated with him.

The new president, Ed. Sullivan, has a splendid ample of efficiency to emulate during his term as pr dent. Ed. Sullivan is liked by all people in the indus about Los Angeles and has proven himself worthy of honor conferred upon him and undoubtedly will be successful in the conduct of the office as he has been building up his milk business which he started with wagon a few years ago and now operates forty truck

Charles L. Dameron of the Mutual Dairy Associat is the new vice-president and Mr. Dameron will be a to render great assistance to Mr. Sullivan in the cond of the office and it must be admitted by all that his ca judgment and fine manner with the boys with whom is associated and with the general public will be of gr value to the association. He is a man of few words, has a very keen mind and everyone listens when he anything to say. Mr. Dameron is an outstanding man the association.

Harry Walsh is continued as secretary of the assoc tion and his work for the past few months for the as ciation has proven him to be an invaluable man for t position. Harry is a genial fellow with a smile and kind word for everyone and is diplomacy personified, the right man in the right place.

Each guest at the banquet was issued a number a a drawing was made for a ''door'' prize, which consist of an immense fruit cake. H. E. McCormick, connect with the Excelsior Dairy at Santa Ana, won the prize

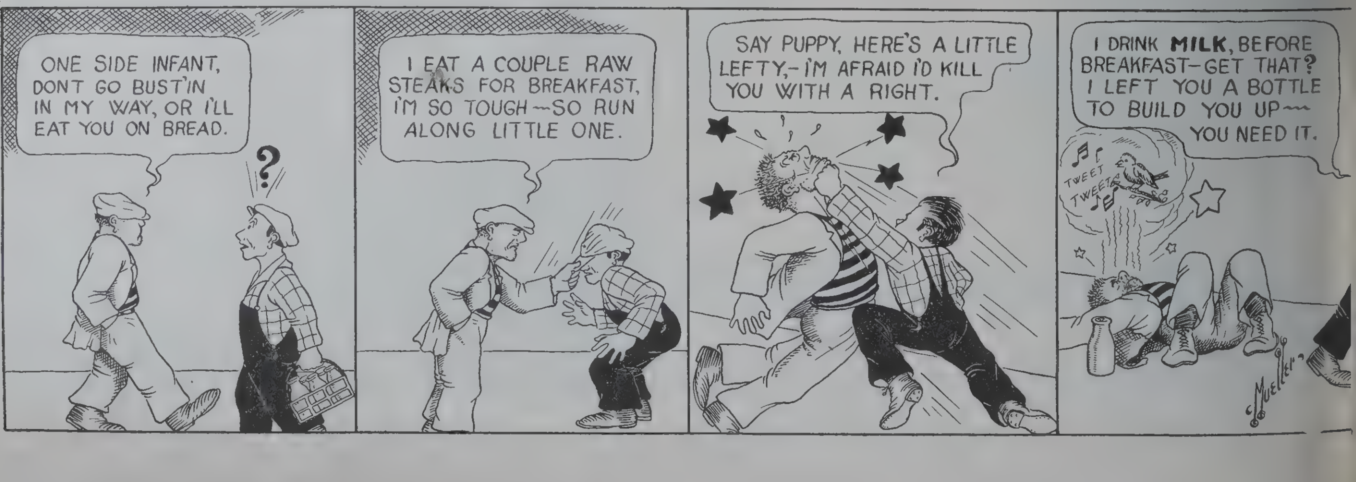
S. Jensen, salesmanager of the Knudsen Laboratori led the members of the ''Yellow Dog'' Society pres in the ''Yellow Dog'' yell and then the whole crowd dulged in a few old time songs accompanied on the pia by Martin Allen, advertising manager of the Adams Corporation, Adohr Creamery.

Tom Butler, who has had twenty-five years experie in store management and sales development and w was stricken with blindness three years ago, delivere short address on ''Little Things that Make Big P ducers.'' He stressed the salesman having confidence himself and in his goods and warned against endeav ing to build up his business by tearing down the oth fellows. Have a good word for everyone and be able radiate a good feeling and enthusiasm. He stressed a looking out for the chief buyers in any firm. The bu er's first attitude is to sit on the check book and cut all salesmen. The salesman's first duty is to get the c fidence of the buyer and instill into him the same thusiasm and coifidence in the goods he has to sell the salesman himself should have.

Doctor Frederick P. Woellner, assistant professor education of the University of California, south

THE MILK MAN

By E. S. Mueller



ONE SIDE INFANT, DONT GO BUST'IN IN MY WAY, OR I'LL EAT YOU ON BREAD.
?
I EAT A COUPLE RAW STEAKS FOR BREAKFAST, I'M SO TOUGH — SO RUN ALONG LITTLE ONE.
SAY PUPPY, HERE'S A LITTLE LEFTY, — I'M AFRAID I'D KILL YOU WITH A RIGHT.

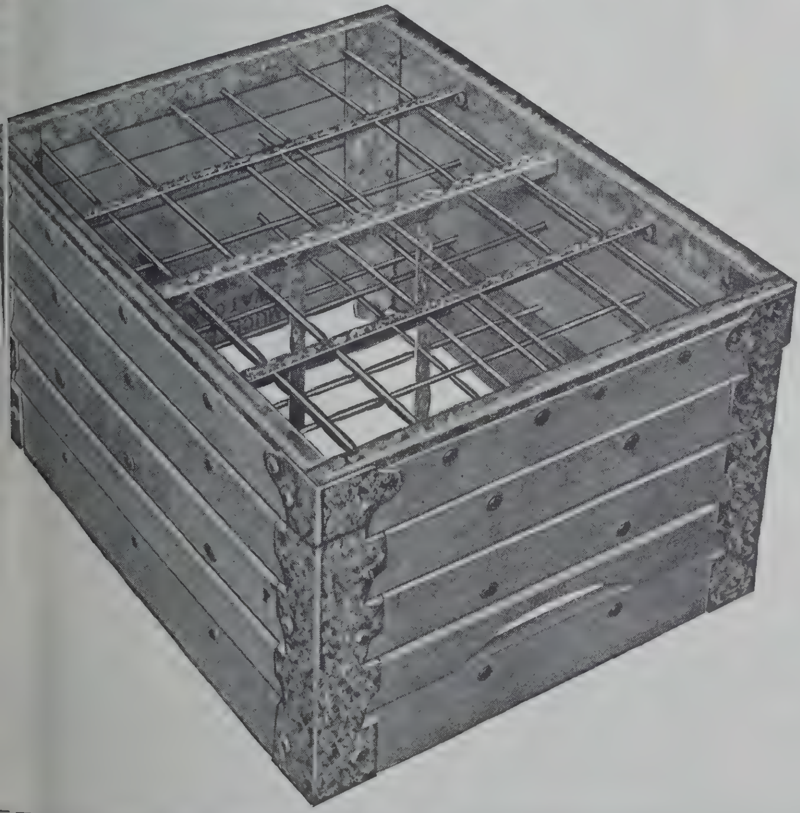
MUCKLE BOTTLE CRATE



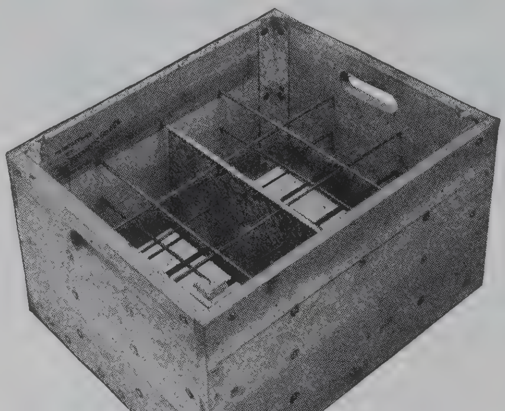
ENGINEERING LEADERSHIP

LEADING A NEW TREND IN BOTTLE CRATE DESIGN

It's the Foundation of Structure that Makes Them Superior!

MANUFACTURED BY
Muckle Manufacturing Co.
OWATONNA - MINNESOTA

The Highest Grade of Galvanized Metal



is used in

REPUBLIC Bottle Crates

"As Strong as the Republic"

ONE of the most important parts of a bottle crate is the galvanized metal. Not all galvanized iron is alike. In Republic Bottle Crates you get the highest grade of galvanized metal obtainable—called "Toncan." This metal costs about one-third more per pound than ordinary grades generally used in making crates. But "Toncan" lasts longer, has greater rust-resisting properties and gives additional strength to the case.

This is but one example of the quality behind Republic Crates. Before you buy, get complete information and prices. You will save money on Republics.

THE REPUBLIC BOX CO.
1693-1711 Merwin Street
CLEVELAND - - OHIO

branch, spoke at length on salesmanship and made statement that 98 per cent of failures were due physical weaknesses. Good health is necessary to cess and co-operation in the firm is necessary as With good co-operation anything is possible. Good operation means protection from any outside troub Doctor Woellner also said we should forget last year not too much anticipate tomorrow, but live for today, with all one's might the job in hand and tomorrow take care of itself.

This meeting will be followed by others from tim time and it is believed that a better feeling will be tivated among those in the industry in this way and do more to promote the welfare of the industry and b ness than anything else. In other words to follow Woellner's suggestion, a close co-operation of all th in the industry will work to the benefit of all those nected with it.

The directors of the Southern California Milk D ers' Association for the year 1927 are as follows:

C. E. Winkley, manager of Adohr Creamery.
E. Burr, manager of Burr Creamery.
C. L. Dameron, manager of Mutual Dairy Associat
J. Henry, of the Henry Creamery Co.
W. H. Jackson, manager of the Santa Monica Da
O. W. Strodthoff, manager of the Hanson Dairy.
E. T. Sullivan, manager of the Peerless Creamery.
W. D. Ranney, of the Excelsior Creamery, Santa A
Ross D. Weaver, supt. of the Los Angeles Cream
H. J. Boyle, manager of the Western Farms Dai
George H. Shaw, manager of Sanitary Gold Seal
H. L. Phillips, ass't mgr. of the Crescent Cream
Smith MacMullin, manager of the Glendale Cream
J. H. Chamness, mgr. of Gold Medal Cry, Long Bea
Robert St. John Gardner, of the Jersey Farms Da

This board of directors represents some of the brains of the industry in Southern California and association will probably accomplish great things un their direction.—Jay Dutter, Southern representat California Dairy Council.

ADDITIONAL DETAILS OF CARNATION CO.'S NEW PLANT.

Walter Page, vice-president of the Carnation Milk Products Co., Oconomowoc, Wis., gave out the following statement regarding the $500,000 milk products plant at Murfreesboro, Tenn.

"The proposed building will be approximately 225 by 72 feet, two stories for the most part, of re-inforced concrete, with roof of heavy mill construction. It will be erected by the company's force. The plant will have a daily capacity of about 150,000 pounds of fresh milk, which may be increased to 200,000 pounds per day by additional warehouse space."

⁂

DIFFERENCE BETWEEN EVAPORATED AND CONDENSED MILK.

The difference between condensed and evaporated milk is frequently misunderstood, due to the fact that both of these types of milk are condensed in vacuum.

Condensed milk is a combination of concentrated milk and cane sugar in a 43-100 sugar and 57-100 milk proportion. The sugar is its preservative. Evaporated milk is merely fresh cow's milk sterilized in cans and from which more than half of the water content has been removed. Nothing is added to evaporated milk and nothing but water removed. Heat is the only preservative.

⁂

BREAKAGE OF BOTTLES IN MILK PLANTS.

The number of bottles that have to be thrown out at milk plants because of chipped or cracked tops or lips is an important item of bottle breakage.

The table below shows that 4.4 chipped bottles were thrown out at one plant for every 1,000 bottles filled. The number of broken bottles at this plant, exclusive of the chipped bottles, was only slightly higher than the number chipped.

Observations indicated that at this particular plant the bottles were chipped on the routes rather than in the plant. Handling bottles through stores seemed to be the chief cause of the high number chipped. The table shows that for bottles of all sizes a much greater proportion of the store or wholesale bottles was chipped than of the retail bottles used for family trade.
—Milk Plant Letter No. 149, Bureau of Dairy Industry.

EXTRACTS FROM AMERICAN DAIRY FEDE TION REPORT COVERING FEBRUARY.

February has been an unusually busy month in Washington Office of the federation. There has bee unusually large amount of correspondence, and man quiries, mostly incident to the closing weeks of the sion of Congress.

Finance Campaign.

The finance campaign is going ahead in good sh The plan has been communicated to all organization the industry and definitely favorable replies have received from several of the largest organizat There has been no refusal to take part from any ganization. The details are being pushed forward rapidly as the circumstances will permit.

World Dairy Congress—1928.

Communications have been received from the Br Committee which has been organized to carry out p for holding a World Dairy Congress in Great Bri in July, 1928, through the courtesy of Prof. Rober Breed of Geneva, N. Y., and steps have been take have an American representative named. Until representative is named, this office will undertake communications between the British committee and industry here.

Annual Dairy Pilgrimage.

Necessary details have been decided on for Second Annual Dairy Pilgrimage, and announceme this event sent generally to member organizations others who may be interested and send delegates. date was finally fixed on as April 26, 27 and 28. first selected date, April 18-24, was abandoned bec of the congestion in Washington hotels at that ti Easter week.

It is important that those who come either as viduals or delegates to the Dairy Pilgrimage, wri advance to the secretary, so that the arrangements w are to be made for the personally conducted through the departments, may be taken care of. T trips make up the major part of the pilgrimage prog The secretary will also make hotel reservations for one who wishes this service.

DIVCO TRUCKS

GASOLINE DRIVEN

3 Point Control

No matter where the driver gets onto his Divco, there is a driving and steering control at hand. Running around the truck and extra steps are eliminated. Divco can be operated from either running board, or from the front seat.

This Three-Point Control cuts down delivery time and saves costs. The driver need not climb into the seat each time while making short stops. Motor is specially built to idle throughout the trip; this saves starting time. On house to house delivery Divco will average 7 to 10 miles per gallon of gasoline. On a straight run, average 18 to 20 miles per gallon.

Capacity 50 cases. Rack for empties on top. Small turning radius. Quick, smooth and quiet operation; practically noiseless. Fool-proof brakes; easy steering.

Growth of the Page Dairy

Toledo's Largest Dairy Grew From an Infant Within Thirteen Years

WHEN the visitor alights at Wade St., in Toledo, near the Union Depot, the long, spread-out plant of the Page Dairy Company greets the eye and is a reminding monument of the progress that has been made by this company within the last thirteen years.

Five additions have been built to the original plant during this lapse of time and a trip through the building shows it well equipped in every department to take care of the vast handling of butter, the bottling of 40,000 bottles of milk per day, and the manufacture of 600,000 gallons of ice cream annually. The company also manufactures condensed milk and condensed buttermilk, cottage cheese, popsicles in season, and the Page bar, which is a form of Eskimo Pie. Five million pounds of butter a year are sold from this plant, some is manufactured there and some is purchased.

About a year ago the last addition was made to the plant and consisted mainly of a new cold storage department. A railroad siding runs immediately adjoining one side of the building and plant purchases made for freight delivery are brought to the plant in this manner. Shipment of some of their products is also made by rail from the plant door.

A gasoline filling station is installed in the great yard of the plant where all trucks and autos belonging to the company are filled with gas and oil. The entire large yard area is of cement flooring.

A deep well pump is being installed now and the company will soon have its own water system.

The plant is particularly well laid out in spite of ing one of many additions. Each department is distin ly separate and each department also has its own c storage facilities. In one butter storage room alo $75,000 worth of butter has been taken care of at time. New cold storage rooms are now being outfit in the different departments.

A moving picture outfit is owned by this compa and is shown at intervals in their large auditorium, latter of which is one of the beauty spots of the pla It has become the popular idea in some of the dairies a ice cream plants to operate these moving picture sho for the education of the public, which is invited occasi ally to become more thoroughly acquainted with the op ations of dairy products manufacture, and they ar splendid advertisement to the public and an excell education for them in the dairy industry.

The auditorium is laid out particularly well, a la stage fronting the entrance, the spacious center equipped for dancing or for shows or entertainments the case may be. The sides are equipped with card tab The chairs are all outfitted with back insets advertis the Page Dairy and make a neat advertising disp when lined in rows. The splendid feature of this au torium is that Mr. Page donates it gratis to church cieties, women's organizations, clubs, etc., for their fairs and they may hold dances, hold card parties, give playlets, as their desire may be, through the cou sy of the Page Company. Oftentimes the ice cream these parties is donated by the company, and it is one their best advertisements. The auditorium comforta accommodates 700 people.

Separate dining rooms for the ladies and gentlem employees are well laid out for the convenience of th luncheons. Rest rooms, lavatories, shower and loc rooms are all of the finest equipment and installed the comfort of employees.

A complete laundry installation of drum wash machine, drier, and ironing equipment keeps over uniforms spick and span each day for the drivers a employees. This is entirely operated at the firm's pense.

Eighty tons of ice are daily manufactured in plant and none is sold on the outside; all is used by company on their own products. Two ice making roo are installed to take care of their needs. Several la ice making machines are taking care of this departm and the 390-ton capacity is run full force in seas Motors totaling 700 H. P. are installed.

The company also operates one separate butter f tory and three condensing plants elsewhere.

Large, spacious offices line the immediate front of building. In the office of Henry Page, one is remind of the athletic features of the dairy. Cups and sil trophies adorn the roll top desk and the flat top de which bespeak the prowess of these amateur tea connected with The Page Company. One particula fanciful one adorned with a silver baseball at the reads, "Trophy for Amateur Baseball. City Champ Federation, 1926. E. W. Weil, Mgr. Page Dairy Co pany."

The thirteen years in business for the Page Da Company shows a remarkable growth and their lea Henry Page, is to be particularly commended upon is able leadership to this attainment.

The LADEWIG-SOELCH *Super-Eight* BOTTLE WASHER

In Action!

RESULTS—this is what prompted the Manitowoc Farmers Co-operative Dairy Co., of Manitowoc, Wis., to install a Ladewig-Soelch Super-Eight.

No matter what washers you are using now: no matter what washers you have examined—this new Super-Eight is far beyond anything you ever thought a washer could be and do.

Simplicity in construction—less floor space—hydraulic principle, pre-rinsing and pressure washing—one-man machine—20 to 60 bottles per minute—no working parts inside machine—no adjustments for various sizes of bottles; half-pints, pints and quarts can be run through together- -perfect temperature control—lower first cost.

Write for Complete Information.

One of the Great South's Best

A Fine, Modern Dairy Plant Now Stands Where Explorers and Colonizers Once Struggled for Dominance

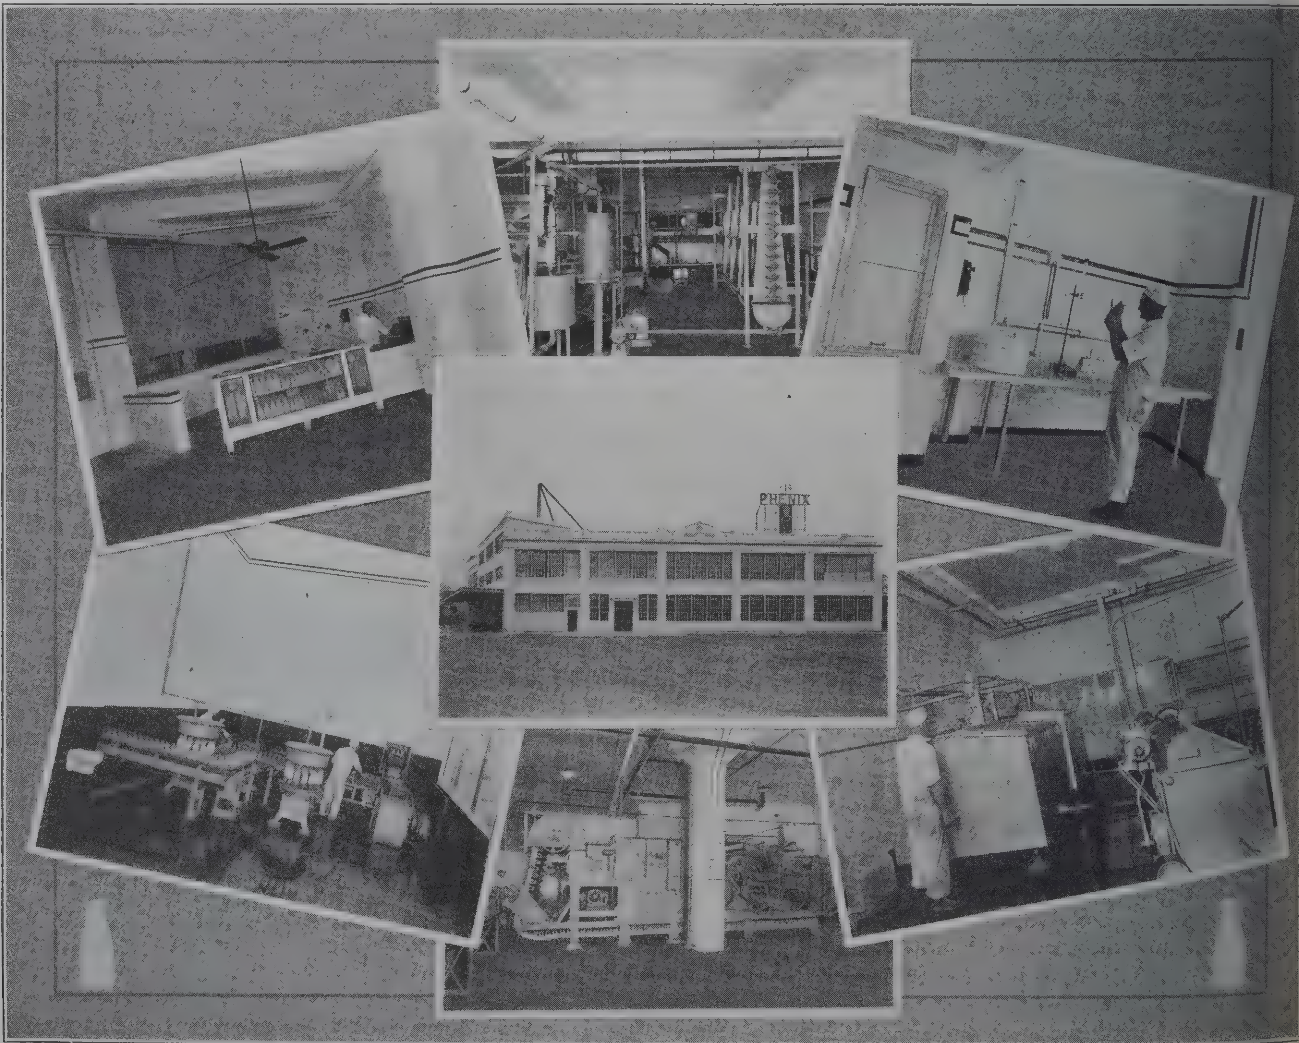
BY A SPECIAL CORRESPONDENT

A MONUMENT to the growth of the dairy industry in the South is the latest dairy plant built by M. C. Oldham as manager. Starting with one wagon on May 4, 1914, Mr. Oldham owned, drove, washed and filled all the bottles himself. Without buying out any business he had built the business in 1920 to 13 wagons. This growth necessitated a new building in 1918 but they have had continuous growth and now this structure stands as the milestone just reached and there is no mistaking the fact that due to plans, location and arrangement it comes as nearly as possible in construction of being a glass house, sanitary, the present 1927 home of 71 retail milk wagons.

This plant of the Phenix Dairy does not cater to wholesalers, but places its emphasis, care and attention on an endeavor to secure and to deliver to the homes "the best milk for the family." Mr. Oldham pays a premium for his milk and has for years, that meets his high standards of quality and production. All milk comes from tested cattle and is ice cooled on the farms. Not only is this a monument to the growing dairy industry in the South, but for efficiency and ease and dispatch in operation it stands equally worthy of comment. It is constructed as Mr. Oldham says, with a large p room, seated and lighted, where any civic clu woman's organization of the city may meet at any of the day or night without charge as one of the h centers of the city of Houston. Health and mill health posters and literature are available to all wh sire same. It is so handy at such times for the g to inspect the plant and learn of the processes us the receiving, pasteurizing, cooling, bottling and ing and delivering of the milk daily from the farm, states—"milk, fresh—rich—pure—pasteurized."

A fountain of the ice-cooled water on the outsi the building suggests also a public service for d and salesmen as well as to the public. In one s day over 1,700 mothers were shown through this Mr. Oldham states that much of the success is due t spirit of co-operation in the organization which has and keeps building the business.

Isn't it fitting and timely in the light of prog that right here where explorers, and colonizers fo for dominance in conquering the wilderness, shoul erected this snow white structure dedicated to he peace, to the greater Houston and to the new Sout

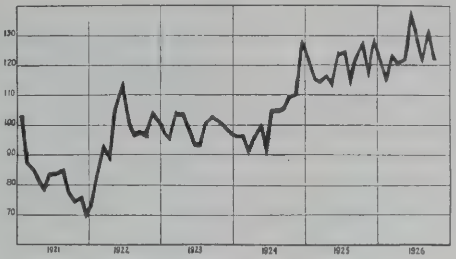


A new temple of purity and health erected by Phenix Dairy at Houston, Texas.

MR. MILKMAN—What Are You Going To Do?

Ten million people have left the farms and joined the mad competition in the cities. Result—Farm products are going to higher levels and the purchasing power of the public is decreasing. Four and five day weeks likely.

A narrowing margin on milk is certain. How will you meet the situation?



Increased Returns on Live Stock

OUR ORGANIZATION CAN HELP YOU

Problems that confront you have been solved by someone. Have you a budget? How fast should your business grow? Can you, quickly, find your weekly profit and loss? Does your bank appreciate the possibilities of your business? Do you? Have you competitive problems? Have you the "guess habit?" Sufficient capital? Cost accounting system? Are your sales below the danger line?

Have you surplus problems? Do you wish to reorganize? Or sell your business? Does your milk show a fine cream line and has your cream a fine body? Have you eliminated theft in your organization? Do you know your daily shrinkage? How to cut merchandising cost without reducing country prices or raising city prices? Are you making enough money?

A Man's Judgment Is No Better Than His Information. Tell us your troubles. Strictly confidential. We can solve them. Don't add to your plant until you have consulted us. Our methods increase capacity without additional equipment. We do not spend—we save.

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

DAIRY SPECIALIST JOINS CHICAGO FIRM.

JOS. N. PRICE.

Jos. N. Price was recently engaged by the National Dairy and Food Bureau, First National Bank Bldg., Chicago, Ill. Mr. Price formerly was head of the dairy division of the University of Tennessee, Knoxville, and was formerly in charge of dairy extension work in the state of Washington for several years. His past experience has eminently prepared him to take charge of the dealer's service for pasteurized milk plants.

Mr. Price's long, practical experience in quality production, manufacture and efficient distribution problems, coupled with his scientific training, makes him a valuable addition to the organization, officials believe. T. J. Newbill, director of the bureau, advises that in addition to the milk and ice cream sales surveys and drivers' training work which the bureau has conducted, it will now render a much needed service on quality improvement work.

Having graduated from the University of Missouri in 1905, under Prof. Eckles, Mr. Price later was assistant in dairying and was in charge of the creamery at Columbia, Mo. While there his research work on feeds and feeding, and the tests on machine milking and milk yields was especially commendable and are now experiment station records. Mr. Price is said to have a thorough knowledge of the basic problems of the industry.

A GOOD RECORD.

The January 1, 1927, report of the Reciprocal Exchange and the Casualty Reciprocal Exchange, Kansas City, Mo., is a record of very satisfactory results.

Cash savings returned to policyholders were $470,029.43, an increase of $66,000.00 over the cash savings returned during 1925.

In addition to returning cash savings of nearly half a million dollars, the exchanges were able to add the sum of $137,193.98 to their surplus and reserves, bringing the total up to $4,311,231.89.

The inspection and safety service rendered is reflected in the loss record of the year, which ran well below the average for both fire and casualty insurance.

The issuance of tornado and windstorm policies by reciprocal exchange now enables members to secure the usual cash saving of 25 per cent on this class of protection.

Bruce Dodson & Company, 28th and Wyandotte Sts., Kansas City, are managers of the exchanges.

Notes From Far and Near

CALIFORNIA — FLORIDA

Birmingham, Ala.—The new plant of the Southern Da
recently completed here is modern in every detail and is
supplied with daylight. A laundry wherein the clothin
the employees are kept clean is a feature of the plant.
G. Gorman, Jr., is the manager of the plant.

Colton, Cal.—The Colton Creamery Co. is investing a
$16,000 in the erection of a new building on 8th and E
this city, which is to have a frontage of 50 feet on 8th S
75 feet on E St. According to Miles E. Nickles, general
ager of the company, the building will be complete
March 15.

Los Angeles, Calif.—The Crescent Creamery Co., this
are making extensive plans of improvements to its pl
which will cost approximately $500,000. According t
M. Dorman, president, a modern $200,000 plant will soo
built here. It is also planned to establish an ice cream
age and milk distributing plant in Redondo, Calif.

Oakland, Calif.—Plans are being prepared for the
struction of a two-story central distributing plant for
Mutual Creameries, Inc.

Hamilton, Ontario, Canada—The Canada Ice & Coal
is rebuilding its ice plant which was destroyed by fire
year. The approximate cost of the rebuilding will be a
$45,000.

Chicago, Ill.—The Wieland Dairy Co., this city, has
creased its stock from $500,000 to $2,500,000, accordin
the correspondent, Fisher, Boyden, Kales & Bell, locate
134 S. La Salle St.
of the Mid-West Corp.

Lena, Ill.—The Sullivan Milk Co. of Chicago have
chased the factory of the Lena Casket and Supply Co.
Sullivan Milk Co. plans installing machinery to concent
milk for tank shipment from Lena.

Indianapolis, Ind.—The Fletcher American Company
announced the public offering of 12,000 shares of Clas
participating preference stock of Capitol Dairies, Inc., of
city, the stock to be sold at $25 a share with an initial
dend rate of 8 per cent.

Rochester, Ind.—A Hammond dairy concern is abou
establish a milk plant here in Fulton county.

Rochester, Ind.—Harry H. Hogue has purchased
Priest Dairy, this city. Arnold Priest, former proprietor,
entered a different business.

Ames, Ia.—Preliminary plans for the construction
dairy plant by the state board of education, this city,
been drawn. The building will be a two-story one and
be of brick, stone and reinforced concrete. It is estim
that the new dairy plant will cost $500,000, accordin
W. H. Gemmill, secretary, State House, Des Moines, Ia.

Davenport, Ia.—Articles of incorporation of the W
ington Dairy, capitalized at $50,000, have been filed with
county recorder. The corporation will buy and sell
butter and other dairy products. Dan MacNeill is presi
and treasurer.

Rockford, Ia.—The Rockford Co-operative Dairy
ciation has begun work on the remodelng of an old buil
here which they will use as their creamery when compl
It will be strictly modern and in accord with the latest
in creamery construction. A Frigidaire plant will be
stalled to take care of the cooling problem.

Boston, Mass.—The New England Dairies, Inc., has
incorporated here with a capital of one thousand no-par
shares. The incorporators are Cornelius T. Curran
Robert W. Henrie of Boston, and James J. Leahy of Che

Somerville, Mass.—The New England Creamery Prod
Company have started work on their new creamery
here. They are installing an entirely separate unit for
special "Double A" milk. They have anticipated the
creased public demand for milk from tuberculin tested h
and after May 1 all their bottled milk will be from
herds.

Detroit, Mich.—The Detroit Creamery Co., this
located at Cass and Adams Streets, plan the constructio
a power house at its proposed new condensing plant at
land, Mich. The cost is expected to exceed $200,000.

Jackson, Mich.—The Chanter Dairy Company has
incorporated here with a capital of $20,000.

Northfield, Minn.—Plans have been completed for an a
tion to the Northfield plant of the Twin City Milk Produ
Association, to be used as a sweet milk and buttermilk dr

Your Success Depends on the *Quality* of Your Product!

Quality is dependent very largely on the sanitation of your plant, and sanitation, in turn, depends on the sterilizing agent you use.

How important, then, to know these things about the sterilizer you use:

1—**How long has the manufacturer been in business?**

2—**What is his reputation for responsibility and dependability?**

3—**Are his products accurately prepared to definite standards?**

4—**Is his concern and its products recognized by authorities?**

General Laboratories has been in business fifteen years and submits its future success, as it has that of the past, to this crucial standard.

B-K is a standard, recognized product. Its dependability has been proved. Write for the proof.

Paris, Tex.—A survey of Lamar County is being made by the Southern Creamery Co., a subsidiary of Southern Ice and Utilities Co., with an idea of establishing a creamery.

Quanah, Tex.—Plans are now under way for the erection of a modern creamery here.

Salt Lake City, Utah.—The Intermountain Dairy Supply Co., this city, which is a consolidation of the H. A. Schellenberger Dairy Supply Co. and the Idaho Dairy Supply Co. has been incorporated at $75,000. The company contemplates construction in the near future of a $15,000 building.

Colchester, Vt.—George Polley of Andes, N. Y., has purchased the local creamery from Sheffield Farms Co. Mr. Polley is a creameryman of many years experience and plans to continue the manufacture of powdered milk, condensed milk, cream cheese, etc.

Bellingham, Wash.—The Western Dairy Products Company has purchased the Ford Dairy Products Company's plant and equipment. L. J. Ford has been retained as manager.

Seattle, Wash.—C. R. Shain and A. W. Pratt have purchased the Royal Dairy, this city, from D. Houts. The new owners are dairy men of long experience and will keep the standard of the Royal up to that maintained for so many years by Mr. Houts.

MALTED MILK POPULAR FOOD.

L. A. Thompson, of the L. A. Thompson Malted Food Co. of Waukesha, Wis., manufacturers of a nationally known malted milk product, announces that the company will erect a factory plant in Los Angeles.

According to Mr. Thompson, the raw milk products there are on a par with the Wisconsin brands and can be obtained at the right prices. The water and rail transportation are ideal for the distributing end of the business.

The Thompson Company has recently enlarged its plant in Waukesha, and has opened branches in Chicago, Ill., St. Louis, Mo., Cleveland, O., Detroit, Mich., and other large Eastern centers. The company is also shipping to South Amercan countries, Australia and New Zealand.

A PROGRESSIVE DAIRY.

In Highland Park, Mich., one of the fashionable s
urbs of Detroit, where the residences of many of
troit's millionaires are located and daily served w
milk and butter from Detroit's third largest dairy,
reporter finds The Highland Park Creamery Compa
enjoying steady progress toward a goal which m
other milk plants are striving for, in the erection o
fine, new plant, and tentative plans are being slo
formed toward the consummation of this goal within
other year's time.

The Prize Winners.

The Highland Park Creamery has a list of employ
who are loyally helping to reach this goal and th
social activities are bringing them before the public
Detroit in many ways. They have an organization cal
the Cream Top Minstrels and these boys bring cheer
the tuberculosis hospitals and other places where s
ferers enjoy their performances from time to time.

The plant is fully equipped to carry on the busin
at a minimum expense and overhead, they manufact
their own harness, build their own wagons, etc.

They have a splendid line of horses used daily in
livering the milk and cream to their hundreds of c
tomers and their horses took the first prize in their cl
at the Michigan State Fair.

Prof. Burke's Inquiry -:- Department -:-

Correspondence Covering a Variety of S
jects of Interest to Milk Distributors

Tennessee.

Dear Sir:—Is there anything to take out the onion flavor from milk? We are troubled a great deal through the South, during the spring of the year, with wild onions, and if there is anything to overcome this flavor I feel sure you will know of it.

Reply: At this time of year onion flavors are especially troublesome in milk and cream, and their removal is a great problem. At the Blue Valley Creamery, Chicago, Ill., this flavor has been removed by the blowing of warm air through cream under partial vacuum. The instrument used is the Pfaudlerizer and much care appears to be necessary for its proper operation.

A simple method which has proved of considerable value is described in Farmers' Bulletin 608, U. S. Department of Agriculture, Washington, D. C., entitled, "Removing Onion Flavor from Milk and Cream," and I suggest you write for this publication.

If you are interested in the mechanical method of eliminating the difficulty, I suggest you write to Professor O. F. Hunziker, Blue Valley Creamery Company, Chicage, Illinois.

* * *

Oregon.

Dear Sir:—I would like to give someone a contract gathering cream. Could you advise me how to go about it? The round trip is about 35 miles. How much cream is required to make it pay?

Reply: I take pleasure in enclosing copies of a contract which I believe will be suited to your needs, with slight changes.

As to the proper salary, this is something you yourself will have to determine as conditions vary so greatly in different parts of the country. You can pay a straight salary or salary plus commission, the latter method being somewhat the better where stimulation of cream production and volume are desired.

On the basis of the price of cream and butter I suggest you calculate what commission and salary would furnish your truck driver a reasonable income. Of course, if you own the trucks it need not be so great as where he owns them. I might add in conclusion that cream stations in this section operate on a margin of three-fourths of a cent per pound butterfat. Perhaps this may assist you in figuring what you can afford to pay.

* * *

Australia.

Dear Sir:—Some months ago you were good enough to furnish us with information on milk and cream which was of value to us, and we appreciate the advice you gave us so willingly. We are now in need of assistance again; permit us to approach you once more.

The standard here for a table cream is 35 per cent, but a cream of this fat content will not sell for the reason that it is too thin. In order to get the correct thickness we have used from .3 to .5 per cent gelatine, but after standing for more than 12 hours exposed to ordinary temperature a very bad smell develops. It will keep sweet for many days, except for this objectionable smell, which we have proved is due to the gelatine.

We have tried pasteurizing at 142 to 180 degrees,
pasteurizing first and adding gelatine at about 80
grees, with no better results.

Do you know of any means for treating gelatin
get over the smell, or any substitute with the same th
ening qualities? We notice that 35 per cent thick cr
is advertised freely in The Milk Dealer, and we th
you must have some means of thickening which does
affect the whipping. The latter is important to us,
cream for pastry cooks. At present we are using
per cent cream, which is hard to sell at a profitable p

Reply: We are always especially pleased to rec
inquiries from foreign lands, as it indicates the w
spread circulation of The Milk Dealer, and the inte
taken in that publication.

It is gratifying to know our services have assi
you, and we hope the following may prove helpful.
quiries are always welcomed.

I note the difficulty which you are experiencin
attempting to produce a viscous 35 per cent cr
through the use of gelatine, therefore I am going to
three probable remedies.

First Suggested Remedy.

I would like to inquire what brand and what gr
of gelatine you are using. A very high grade of gela
should contain few bacteria. I have tested about th
hundred samples of gelatine and found them to
from near sterility to over twenty million bacteria
gram. It is undoubtedly a high bacteria content in g
tine which is causing all of your trouble.

I suggest you investigate the bacteria count of
gelatine and request a certificate from the gelatine re
sentative or firm from whom you buy, guaranteeing
bacteria count to be under, let us say five to ten thous
per gram. Along with this I suggest you secure a g
tine having a high gel strength; in other words, se
a product of guaranteed purity from the bacteria st
point which is coupled with other desirable quali
such as high strength, low ash content, low acidity,
tremely mild odor when dissolved in hot water, g
clear color and appearance, etc.

This type of gelatine should readily withstand h
ing. The critical point of injury to gelatine strength
heat, is 140 degrees F., however, I have heated m
high grade samples to 170 to 180 degrees F. with
materially affecting their jellying properties.

I note you have pasteurized the cream but not
gelatine. Hence I suggest you try using .4 per
gelatine, soaking it in luke warm water for ten minu
(add the gelatine to the water for best results) and
low this by pasteurizing at 140 degrees F. for 20 t
minutes. Add it to the hot pasteurized cream, stir
well and cool down immediately. If you are still t
bled with the bad odor try soaking the gelatine as ab
heat to 180 degrees F. and cool down immediately w
out holding, to 145 degrees F., adding it to the cr
at the same temperature and cool down at once.

Second Suggested Remedy.

If the above fails to overcome the trouble, try this

To your 35 per cent cream add two to three per
of skim milk powder, heating slowly to 120 degrees F

dissolve the powder. Follow this by pasteurizing at 145 degrees F. for 30 minutes. Cool to 65 degrees F. and place in well tinned cans. Dilute 20 drops of commercial rennet extract in about one-fourth glass of water and add this to one hundred pounds of cream, agitating thoroughly while adding to insure adequate distribution. I suggest this be added to the cream in the well tinned cans and the cans immediately set in a cold room where the cream will cool over night without any additional agitation, to 50 degrees F. or slightly lower. Next morning I believe you will find it especially thick and quite easy to whip.

I suggest in first applying the above you omit the addition of skim milk powder. This can be used later if deemed necessary.

Third Suggested Remedy.

For the third remedy, I suggest the following. In this you will note I have used the addition of no special products, the whole process being based upon the method of handling the milk before separating. This remedy alone, or this plus the second, should give you the desired thick cream.

Recent experiments at the Geneva, New York, experiment station have shown that milk which is separated as soon as drawn from the cow, produces cream of low viscosity, but if this milk is cooled and held at a temperature of 37 degrees F. over night and then warmed up to 80 degrees F. and separated, the resulting cream, after standing about twelve hours, will have a viscosity of approximately ten times the product separated from fresh milk. The reason for this is that the fat globules in fresh milk are soft and are readily broken up and dispersed when the milk is separated. If the milk is kept cold the globules become very firm and, instead of being dispersed they clump together after separating and this phenomena causes the increased viscosity. A similar increase in viscosity is also noted when pasteurized milk is allowed to stand at a low temperature over night and then warmed to 80 degrees and separated the next morning. If it is allowed to age over night you will again find a very great increase in viscosity.

Baltimore.

Dear Sir:—I would like to have you send me a book on ice cream and pasteurized cream **testing**, also book on **testing cream and ice cream for bacteria count per c.c.**, showing the most efficient and quickest way for making tests. I now have a 10-bottle testing machine (electric) (but do not use steam), and I find that tests vary considerably. Advise me, please, if this is due to temperatures of cream and ice cream varying.

Reply: Into an eight or ten per cent milk test
weigh 9 grams of the melted and well mixed samp
ice cream. Add 10 c.c. of ethel or denatured alc
Mix thoroughly and add 9 c.c. of commercial sulp
acid. Centrifuge in the electric tester making two
tions with hot water to the bottle and completing
test as for milk. Place the tests in a water bath h
to 130 to 140 degrees F. as soon as removed from
tester. Allow them to remain in the bath for five
utes, read as for milk and multiply the reading by
It is very essential that all Babcock fat tests of
products be placed in the water bath for five mi
before reading and the water must be deep enou
completely surround the fat column in the bottle
This is essential for accurate results. Pasteurized c
is tested for fat in the same manner as unpasteu
cream. I am enclosing a new circular which will
you complete details of the process.

I am sorry we have no available bulletins on te
ice cream or dairy products for bacteria, and I su
you write to The American Public Health Associa
370 Seventh Ave., New York City, and secure a co
Standard Methods of Milk Analysis. This public
will cost forty cents, but it contains complete inform
on bacteriological analysis.

Now as to the cause of variation in cream
Cream from the same source will vary from day t
depending on many factors, such as:

1. Richness of the milk from which cream is
rated.
2. Temperatures used in separating milk.
3. Speed of the separator.
4. Rate of running milk through the separat
5. Amount of flush water used to flush sepa
after separating.

If your letter refers to a variation in tests bas
the fat content which you calculate your ice
should contain, then there must be some error i
way you are standardizing the mix.

Again, you may be standardizing properly bu
failing to weigh the cream and ice cream into th
bottles before testing. Cream and ice cream mu
weighed into test bottles for testing; they can n
measured. This is because they are viscous and ma
tain air; a great amount sticks to the pipette and
the amount delivered into a test bottle by a pipet
pends on the specific gravity or weight of the pr
The greater the fat content of cream the less weig
livered by the pipette. If you weigh the cream a
cream then temperatures will have no effect o
amount placed in the bottles.

TRADE ASSOCIATIONS AND NEW COMPETITION.

(Continued from page 27)

In the case of clothing, the limitations are not so restrictive—although there is a limit to how much we can wear at a time—I am not so sure about the limit to how little we can wear—we can still have bigger wardrobes. But there are certain limitations as to what can be worn together—especially for the fair sex. What is called the ensemble is, in the new competition, the equivalent of the rules of civilized warfare. When what our grandmothers used to call limbs began to rival the colors of the rainbow, the shoe manufacturers faced the problem of their lives. Shoe and hosiery had "to go"—and they finally did because the shoe manufacturers and the hosiery manufacturers a year or two ago began to get together each season and set the colors which would be made popular.

When it comes to shelter, however, there are fewer limitations and the new competition between building materials is waxing fast and furious in every field of construction. One would think that the natural and technical properties of
building materials would be natural limitations in thei
And yet we find that there is a steady encroachment by
material into the fields of the other. Some of the stro
and most highly organized trade associations in the co
are fighting hard in the new competition in constructio
terials. The Portland Cement Association, for examp

it is up to the association secretary and the advertising agent to start selling the idea all over again to a new committee.

Warns Secretaries on Advertising.

A premature, vaguely-understood co-operative advertising campaign is worse than none at all. It is not enough to take full pages in magazines of two million circulation with a picture of a pretty girl and a slogan, "You need iron—eat more rivets." Trade association advertising is not a way of getting off cheap—whereby each member contributes a little and gets a lot. It is not a substitute for individual advertising. Trade association advertising is worth only as much as the individual members drag out of it—not what they put into it. Trade association advertising must be supplemented by individual advertising and merchandising to get its real value. The return on co-operative advertising is directly proportionate to the strength of its tie-up with the members' individual efforts.

Association advertising is a vital weapon in inter-commodity competition—it may be the most vital—but the new competition, like modern warfare, cannot be fought with a single weapon. It is not enough to tell the public to eat more of this or to wear more of that. Every product needs research to develop new uses and new markets. About every product the public needs facts—not advertising fancies—on efficient use and economical use.

After All It's a Price Issue.

Above all, inter-commodity competition is to a great extent price competition—if brick goes too high, people build with lumber; if meat prices go too high, people eat eggs, vegetables or cereals. To meet inter-commodity competition, it is therefore essential that the price of the product be brought down to the lowest possible level consistent with a reasonable profit. And there are dozens of ways in which a trade association can help accomplish this.

Inter-industrial competition is more difficult to meet—it is more indirect, more insidious. It is easy to know the alternative commodities with which you have to compete. It is much more difficult to know what other industries, apparently unrelated, are encroaching on your share of the consumer's dollar. And such competition has to be met indirectly. If other ways of spending money become more attractive to the consumer, the way in which you are interested must be made more attractive. More important even than this, the distribution system and the prevailing methods of merchandising must be watched constantly. You must not allow any other product which might compete become easier to buy. Of course, there are limitations to the extension of such facilities. The easier you make it to sign on the dotted line, the harder it may be to make the signature mean anything.

Inter-commodity competition may be the most spectacular of the types—but I do not believe that it is necessarily the most significant.

Study This Particular Type.

The other types of the new competition, which I have called inter-distributor competition, may have even more revolutionizing effects on business. Where it is recognized, it is certainly causing more heartaches and headaches. It is difficult for a business to reconcile itself to any change in its relative position in an industry. It is hard to overcome the idea that there is a caste system in business—that a manufacturer must be only a manufacturer, that the wholesaler has a definite place in business and that the retailer must always stay behind the counter. It is a shock to many to find that the stream of distribution does not have to run in the same channels that have guided it for hundreds of years. There is no economic law which has determined that a manufacturer should produce and sell to a wholesaler who in turn supplies the retailer. Is there one sound reason why manufacturers should not sell direct by mail or by canvassers? Is there any reason why department stores should not advertise nationally and build up mail-order departments? Is there any reason why a wholesaler should not organize a chain of retail stores or why a group of retailers should not organize a buying syndicate and cut out the wholesaler? The only possible reason is that such a step may be uneconomical—and the one who takes it will probably find that out first.

There is nothing sacred or eternal about any process of distribution. There are too many "mammy-songs" in trade association meetings—too much sentimental wailing about the old and traditional ways of doing business.

Should Small Associations Unite?

That is one of the big reasons why so many industries today are houses divided against themselves. Each factor in the line of distribution is trying to take advantage of the others and passes blood-curdling resolutions when the other party tries to get back. Each factor in each industry t to have its own trade association and to work out its destinies—usually opposed to the destinies of the other tors in the industry. Too much time is spent on resolu condemning such practices as group-buying, direct-sel hand-to-mouth buying, price-cutting, special prices for c stores and "free deals". All these resolutions are abou effective as the tribal dances savages dance before goin war, or ministrations of medicine-men or other supersti of primitive peoples, such as stealing a hair of your ene head and burying it at midnight.

There is no place for voodooism in American busines

The only way in which inter-distributor competition be met is by efficiency. The only way of preventing the fellow from stealing your place is to make yourself so u that he can't take it. The only way of keeping the ret from going into the wholesale business is to become a b wholesaler. If you have learned anything from your ex ence, if you have established a reputation and techniqu you serve as you should, you have advantages which the comer will find it hard to beat. And the only way fo trade association to help the member meet this type of petition is to help him become a more useful link in the of distribution.

New Problems and Ethics.

There are hundreds of unsolved problems which arise this type of the new competition—but they are not et problems. They are simply practical business problems as such only can they be solved. New methods of doing ness are not necessarily fraudulent or unfair or uneth They cannot be fought by indignant resolutions or appea legislators. I do not know of a single case in which methods have not failed absolutely and yet trade associa keep on "resoluting" against the new competition. I d intend to offer here solutions to these problems—ever dustry must work them out for itself. But I do want to gest some questions. They are not oratorical question do not know the answers to some of them—neither do But until we can learn to answer them we shall not be to meet the new competition.

Is the new competition unfair? The new competiti so intricate that there cannot be any general answer. I do not believe that there is any authoritative answe any official body to any of the specific questions involv the new competition. The Federal Trade Commission ca answer them. The government—in any branch—has been able to answer satisfactorily even the comparat simple questions regarding trade associations. The p at which competition becomes unfair is usually vague— particularly so in the new competition. But it is signi that the new competition was unrecognized until those suffered from it began to feel it as unfair. There has al been competition between raw material producer, man turer, middleman and distributor for their share of the mate price. What are fair and what are unfair metho increasing that share?

Nobody doubts that in such competition someone suffer seriously—but does that make it unfair? To extent are ability, foresight, enterprise, ingenuity, inf or good fortune unfair?

Who Is To Judge?

Who is to judge whether the elimination of the mi man is or is not in the public interest? How about the dlemen—can they not claim that attempts to eliminate are unfair? Suppose by eliminating the middlemen, were reduced, would that make it fair? Of course, dis tion must be made between the development of a legiti distribution method of permanent value and one whic matter how legitimate, cannot be developed to a usefu vice and which merely harasses and destroys exi methods.

Take the questions of skipping a step in the proce distribution—in the structural steel industry, for exa The steel mills ordinarily sell to fabricators who mak shapes and serve the builders with material to specifica demanded by the job. The fabricators give an impo service which not only saves time and money for the bu but also for the mill. Some of the larger mills, in att ing to increase their own individual volume to keep built plants busy, are now selling direct to builders- sometimes at a price lower than that which they ask fabricators. They do not do this on the difficult jobs require more service, but on the simpler ones. They selling in smaller and smaller quantities direct to the bu —selling at retail. Conditions are similar in the shoe i try, in the textile industry, in the food industry. Is petition with one's own customers ethical? I do no that it has anything to do with ethics—it may prove short-sighted business to destroy a valuable factor in tion. Especially is this so when nothing is really gained in the end—the total volume of structural steel used is ncreased one pound, nor the total volume of shoe sales ocery sales, by such methods. And the money and effort ved in such methods could probably help to increase the ne of business for everyone in the industry if they were ed constructively.

e are guaranteed "life, liberty and the pursuit of hap- s"—but it is becoming increasingly difficult to enforce guarantees in the complexities of the new competition. is commercial democracy? What is commercial equal- equality of commercial opportunity? And what is an nocratic limitation of opportunity?

Proves One Way Out.

ich vital questions between the different factors in in- y cannot be solved by having separate organizations and ate meetings at which each side sits and makes faces at ther. Some industries have already realized this and joint committees of producers, manufacturers, whole- and retailers. Joint committees discussing everyday ices and terms are a step in the right direction—but problems are simple compared with those of the new etition. It is on the very problems of the new competi- hat the clash of interest grows most bitter. But per- the strife of inter-distibutor competition will be quieted ie sake of strong union to meet inter-commodity com- on.

is only by industry-wide co-operation that inter-com- y competition can be met. Every element must forget auses of strife—all must contribute. It is not fair to t the manufacturers to bear the burden of a co-opera- dvertising campaign alone—or the retailers alone, or roducers alone. That which benefits one benefits all ll should contribute effort and money.

Strong Associations Are Needed.

ut every effort demands strong trade associations. The competition cannot be met by weak associations. A ary plus a figurehead and a letterhead do not make a association. A trade association must consist of a mem- ip which does what it wants its secretary to do for it. many trade associations the secretary's salary is in the e of alimony paid by the members to be left alone. The ganized or unorganized industry with a weak associa- as about as much chance in the new competition as the rbial celluloid dog with wax legs chasing an asbestos rough hell.

hat do I mean by a strong trade association? Let me st as an example a national organization with head- ers here—the Institute of American Meat Packers. And e say right here, that when I refer to such an associa- hat I am not cutting out the small association, well ized, adequately financed and capably managed. Where ind a trade association executive with brains and one ssing those qualities of leadership so necessary in all erative undertakings, you'll find a membership that is g. I want to stress that point. It is the association working membership that gets results. That's the cant thing about the Institute of American Meat Pack- t has a membership that works. It is one of the best ed and organized and most effective associations in the ry—and one reason is that its members are active. t is significant that it has been built up in an industry ich there has been not only the keenest competition ven the members but also deep antagonism from the factors in the industry. The packer's association not oins together for co-operative effort the packers but by and immensely valuable service also brings the whole ry together, from producer to retailer. On the one the packers have joined with the livestock producers to the National Livestock and Meat Board to improve rais- ethods and devise better methods of handling livestock well as to promote the sale of meat products. On the hand it has organized local Meat Councils of packers' etailers' representatives to work out fair practices in g with each other and in helping the retailers to de- into better merchants. For the packers themselves, the ite provides a long list of real services—not paper ones uding research into better operating practice; tests and rdization of equipment and supplies; tests of samples ducts; co-operative buying; university courses for train- ecutives in the industry; scientific research in nutrition ublic education in home economics. When the associa- s ready—when all the members heartily believe in it ill be able to get the most out of it—the industry will ly go into co-operative advertising.

ite this merely as a local example of what a trade asso- n can do to meet the new competition. There are dozens er well organized associations I could refer to, like the nd Cement Association.

Names a Needed Committee.

The time is approaching when the present methods of trade association activity will be found inadequate. Every trade association will then have a standing committee on the new competition—and it won't be the kind of committee which is so prevalent now. Sooner or later—and the sooner the better—such committees will develop into a board of strategy for each industry as a whole. It will be the duty of such a board of strategy to use the utmost resources in vision, brains and money that the industry possesses in studying continuously the new competition—and in carrying out the necessary measures for defense and attack. These are no tasks for letterhead committees.

The work of these boards of strategy will grow bigger and wider—there will be inter-industrial boards to work on common problems—there will be international boards which will develop world-vision and means of world-action. The only answer to the new competition is the new co-operation.

⁂

A WORTH-WHILE THOUGHT AS PORTRAYED BY A SMALL MILK DEALER.

Frank Baird, operating a small sized dairy plant in Toledo, Ohio, said a mouthful in a few words recently, which may be a splendid idea for some of you other small dairy plant owners to consider, and even some of the larger ones.

Mr. Baird does the collecting twice a month and does it himself. He operates a three-wagon route, one he runs himself, one is covered by a brother and another by a driver to whom he sells his milk and cream outright, allowing the driver to make his profit off the sale from the milk wagon. The accounts carried by the two former drivers are taken care of by Mr. Baird. He does no collecting while operatng on his route but takes afternoons semi-monthly and personally visits with his customers and builds a friendship in this way which would make it hard for a competitor to secure one of his accounts. Mr. Baird stated that in a small business it is possible to do this and gave as his reason the fact that the driver does not have the time to do it with any of the little personal touches which make and keep customers; he is in a hurry to cover his route and, of course, does not take the personal interest in the customer that the owner of the dairy does.

In speaking of personality, Mr. Baird expressed the fact that he believes most dairy equipment is purchased on that basis. He has had experiences covering his years of work in the dairy industry which have shown that customers will not tolerate perhaps a certain driver, whom the dairyman might think is an excellent worker and might not like to lose the services of, but will finally have to dispense with his assistance because he has not the personality to go over with the dairyman's customers. He simply is not liked on the route. He explains that it is the same way with salesmen to the milk industry; it is very easy to buy equipment and supplies from the salesman whom they like personally.

Mr. Baird is one of the dairymen who has spent the greatest number of years in this work in Toledo, and has taken but thirty-two days' vacation in the past 18 years, and no vacation for the past four years. He says the work is pleasant and interesting, but the proprietor must be on the job in order that affairs run smoothly about the dairy and for the customers.

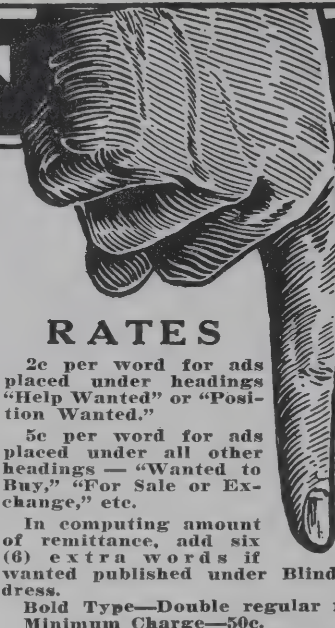
⁂

WILL MANUFACTURE BUTTER THIS SPRING.

The Scheffert Bros. Dairy of 869 Atlantic Avenue, Toledo, O., are adding the manufacture of butter to their dairy business, and will begin operation in this department this spring. A competent buttermaker has been hired.

The Best and Newest Equipment Is Advertised Consistently in The Milk Dealer.

WANT DEPARTMEN



HELP WANTED

(Rate: 2c per word)

HELP WANTED—Salesman calling on dairies to sell our bottle crate on commission. Liberal proposition. American Box and Crate Co., Louisville, Ky. 3-27tf

WANTED—Inspector and efficiency man, in and out of plant, handling city milk, butter, and ice cream. Must be a crank on cleanliness, quality and efficiency. Address: D-176, The Milk Dealer. 3-27

Wanted Advertising Man

with proven sales ability and one who has a good knowledge of the various branches of the dairy products businesses —

who is well versed in advertising and merchandising —

who can present and sell a high class proposition —

To this man is offered an attractive and profitable connection with a concern which is the largest of its kind.

In your first letter please give a complete statement regarding your experience, ability, etc.

Correspondence will be held strictly confidential.

Address: D-108, The Milk Dealer, 4-27

POSITION WANTED

(Rate: 2c per word)

POSITION WANTED—By a man who has had 18 years experience in the sales end of the milk business. Address: D-157, The Milk Dealer. 3-27

WANTED—Position as sales manager or supervisor of milk routes. Am 29 years old. Eight years experience. Fully capable of handling any situation and of building up sales. Address: D-156, The Milk Dealer. 4-27

POSITION WANTED — By dairy man with 16 years experience. Understands thoroughly buttermaking, pasteurizing, cottage cheese. cultured buttermilk and cream. Good reference Salary $40 a week. Address: D-169, The Milk Dealer. 3-27

POSITION WANTED—As superintendent or foreman in a city milk plant. I have had five years of commercial experience and four years of college work in dairy manufacturing. Please mention salary and possibilities of a job in your first letter. References. Address: D-175, The Milk Dealer 4-27

WANTED — Clients who should have more capital, cash profits, more room, more business, better products, better help, less guesswork, re-established confidence with bankers and public, better cost system, less surplus problems, low daily shrinkage. We are helping others, we can help you. Write us. Charles F. Schwager, Service and Sales Corporation, Omaha, Neb. 3-27

RATES

2c per word for ads placed under headings "Help Wanted" or "Position Wanted."

5c per word for ads placed under all other headings — "Wanted to Buy," "For Sale or Exchange," etc.

In computing amount of remittance, add six (6) extra words if wanted published under Blind Address.

Bold Type—Double regular rates.

Minimum Charge—50c.

Blind Address — EXTRA — 25c in U. S. only; 65c Foreign — To cover postage in sending out replies from this office.

REMITTANCE MUST ACCOMPANY ORDER.

IT PAYS TO ADVERTISE

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of this paper.

NOTICE

The publisher disclaims any responsibility for the reliability of parties advertising in the Want Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting suspicious dealings.

We reserve the right to refuse to accept advertisements which we believe are detrimental to the dairy industries.

Want Ads are accepted up to 7th of month preceding date of issue. Forms close on that date.

POSITION WANTED — By young man, 30, familiar with the manufacturing of all dairy products, Swiss cheese a specialty. Knows how to keep up-to-date double entry books. Address: D-154, The Milk Dealer. 3-27

POSITION WANTED—By man experienced in the manufacturing of condensed and evaporated milk. Can qualify as foreman or manager. Will accept position as pan operator or Mojonnier chemist where there is chance for advancement. Can furnish references as to my ability and character. State all particulars and salary. Address: D-171, The Milk Dealer. 3-27

FOR SALE or EXCHANGE

(Rate: 5c per word)

BUSINESSES

FOR SALE—Pasteurizing milk plant in eastern Pennsylvania doing around 3,000 quarts daily. Owner in poor health. Plant built (everything new) four years ago. Will sell for less than half of original cost to quick buyer. Only half cash needed, balance on mortgage for 5 years. Address: D-168, The Milk Dealer. 3-27

FOR SALE—Ice cream plant complete. Two freezers, "brine," pasteurizers, milk cooler, all equipment. Two milk routes. Our own cooling rooms and ice machine. Address: D-172, The Milk Dealer. 3-27

MACHINERY AND SUPPLIES

What would you do?

A

roduct

Just suppose that at 10:27 this morning, or any time when it would be most inconvenient, your only large capacity bottle washer stopped suddenly—damaged in some way or another so that immediate repairs could not be made — what would you do?

What *could* you do? Probably put every man that could be spared on to the job of washing bottles by hand. Dust off the old brush washer, remove the what-nots from the sink, and hope that the big machine gets fixed. Schedules all topsy-turvy—men not too pleasant—overtime—money lost—high bacteria count—it's a bad fix to be in.

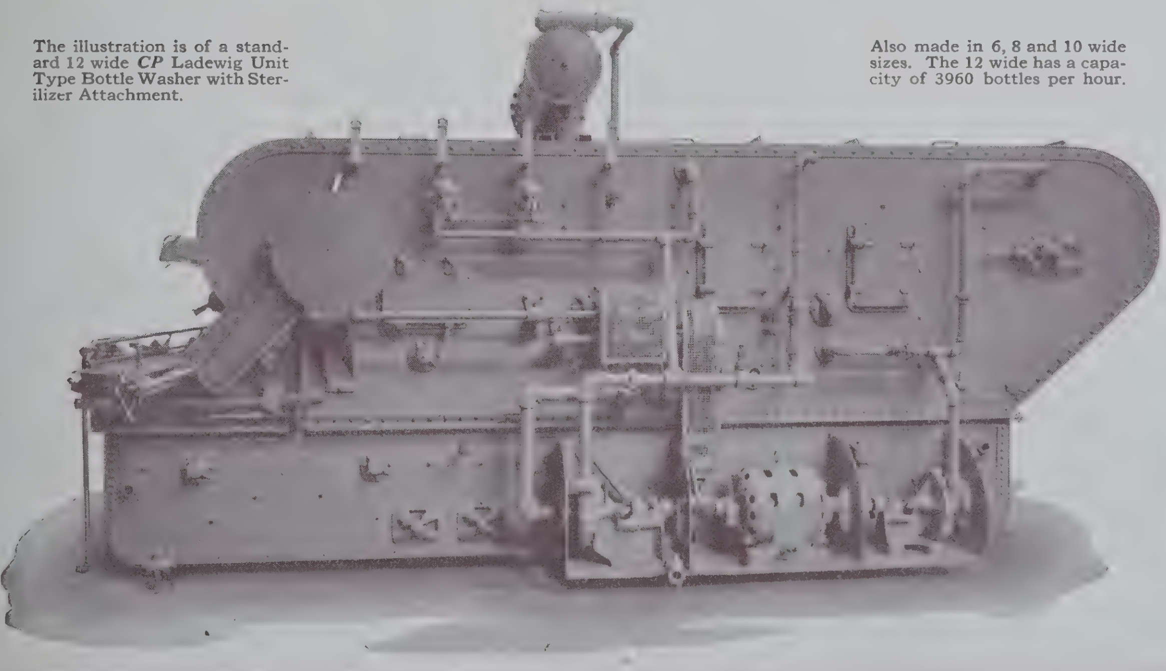
The *CP* Ladewig Unit Type Washer is constructed so that complete breakdowns are well-nigh impossible. Slow motion, simplicity and positive action, together with unusually fine construction of highest grade materials, is proof against serious trouble.

Day in and day out, the *CP* Ladewig will do the bottle washing job, and do it right. It never falters or acts up. It is reliable, dependable—as fine as can be built. When you must put all your eggs in one basket, why not put them in a good one?

Write for Bulletin 1131, which gives full particulars.

THE CREAMERY PACKAGE MFG. COMPANY
1243 W. Washington Blvd. Chicago, Illinois

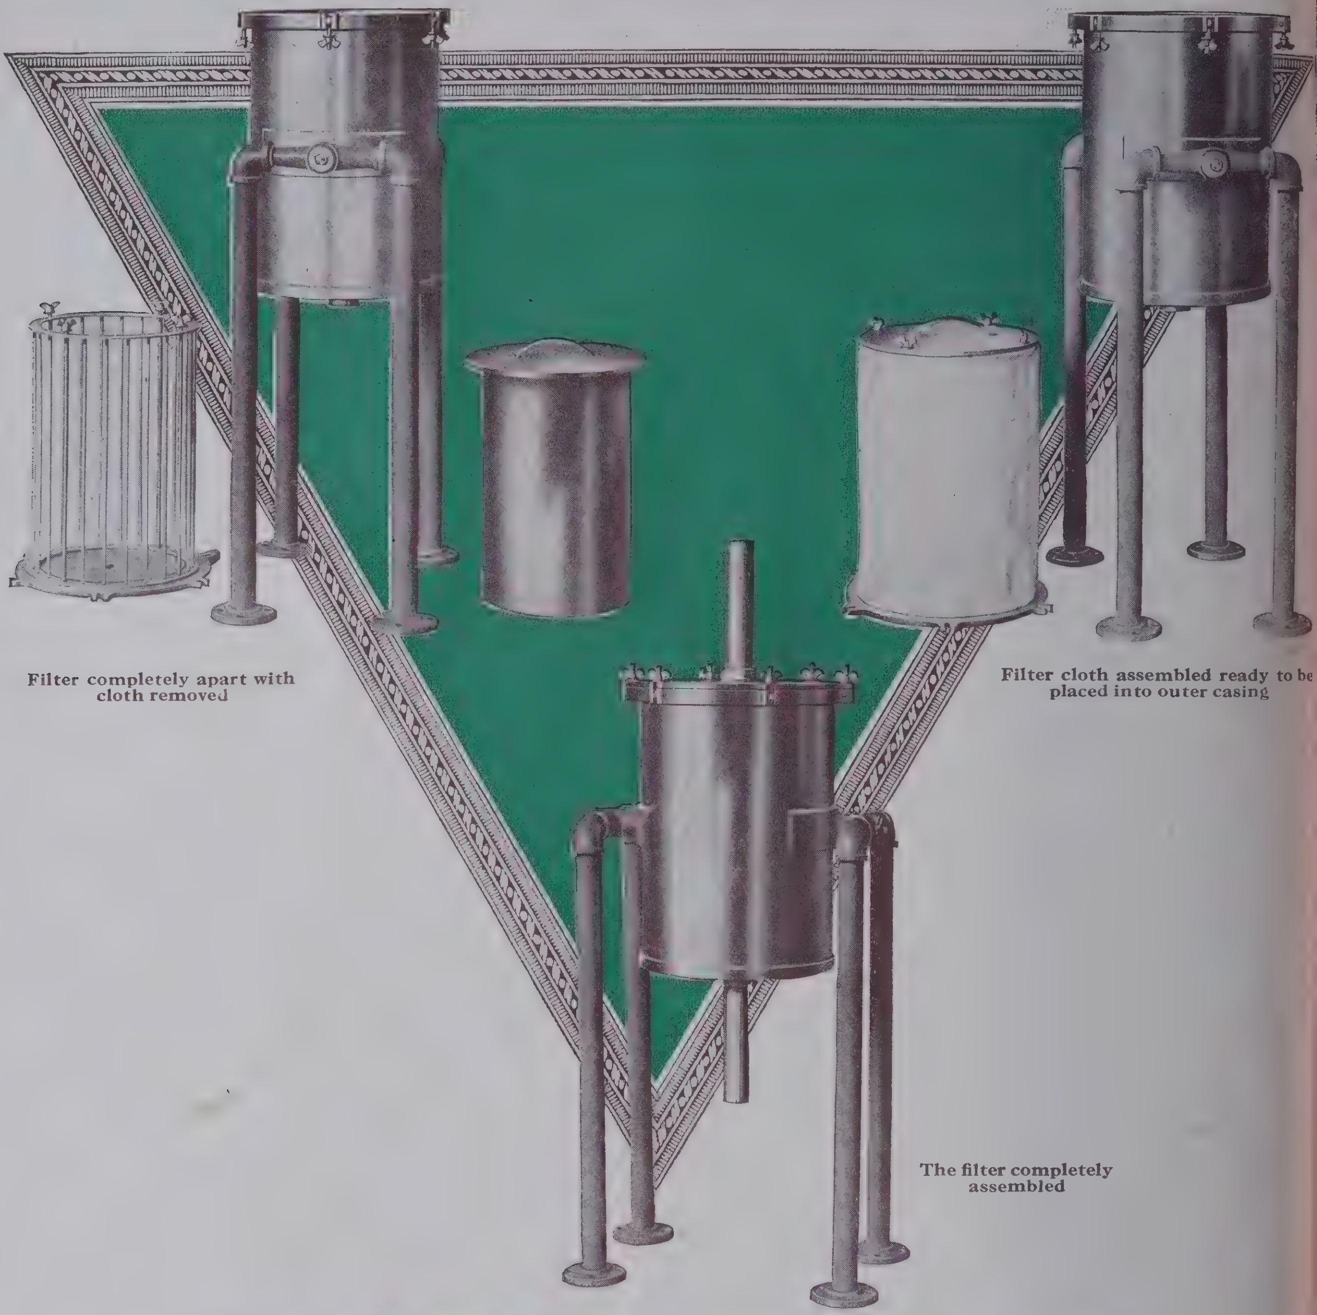
Sales Branches Everywhere.



The illustration is of a standard 12 wide *CP* Ladewig Unit Type Bottle Washer with Sterilizer Attachment.

Also made in 6, 8 and 10 wide sizes. The 12 wide has a capacity of 3960 bottles per hour.

"FOR BETTER MILK HANDLING"



Filter completely apart with cloth removed

Filter cloth assembled ready to be placed into outer casing

The filter completely assembled

The **YORK** No. 2 Filter

WITH a capacity up to 12,000 lbs. per hour the YORK No. 2 FILTER will meet the needs of practically any dairy.

It can be taken completely apart and cleaned thoroughly. There are no wires or screens to clog or catch the dirt.

The filtering cloth is easily removed and cleaned. The YORK No. 2 FILTER is made of 2-ply tinned heavy copper sheet and brass castings heavily tinned all over.

by everybody.

Coffee Milk---A Zippy Special That Gets New Custome

Every day will bring you dozens of new customers for COFFEE-MILK in offices, shops, stores and homes.

ONCE let your driver-salesmen take out a few cases of Coffee-Milk over their routes and you will find out how fast Coffee-Milk boosts sales. It is a wholesome milk drink with the true, full flavor and tang of coffee. Not too sweet—just right; Coffee-Milk is fast becoming the most popular drink wherever served.

Made from full flavored, fresh roasted coffee, highly concentrated in syrup form. Easy to mix with milk; no equipment necessary. Never settles at bottom of bottle; no sediment. Write for prices and sample.

Sold in 12 oz. and 16 oz. bottles for home use and in one gallon and ten gallon jugs for milk dealers.

ARABIAN BRAND COFFEE SYRUP

A Super-Eight Installation at the Manitowoc Farmers Co-operative Dairy Co., Manitowoc, Wis.

Perfect Temperature Control

Eliminates Bottle Breakage

in the New

LADEWIG-SOELCH *Super-Eight* BOTTLE WASHER

FROM the first rinse until the final washing the temperature of the water in the Super-Eight is carefully graduated and under complete control. This prevents breakage and saves many a dollar over a year's time. Bottles come out perfectly clean, sterile, and *cold.*

No adjustments for various sizes of bottles are necessary so that half pints, pints and quarts can be run through together. The clean bottles come out of the feed-in end, saving one man's time.

In design and construction, this Ladewig-Soelch Super-Eight is truly a masterpiece of mechanical engineering, yet it costs less than other washers of equal capacity. Write for complete information.

Use This Tank to Cut Your Overhead

UNDER old-fashioned methods of soldering vat coils, the better part of a day is often lost in removing and replacing the coil—the time that is consumed in doing the actual soldering is very short.

But in Prest-O-Lite soldering, vat coils can be repaired without having to remove them. Similar savings prevail in installing and repairing sanitary pipe lines, resoldering vats, etc.

Prest-O-Lite also excels in the speed and economy with which milk can handles can be resoldered, small leaks plugged up, etc.

And the cost is most reasonable. For your convenience, Prest-O-Lite maintains more than 15,000 gas exchange stations where you can always get a full Prest-O-Lite tank for your empty one—paying only for the gas.

Write for full details and prices.

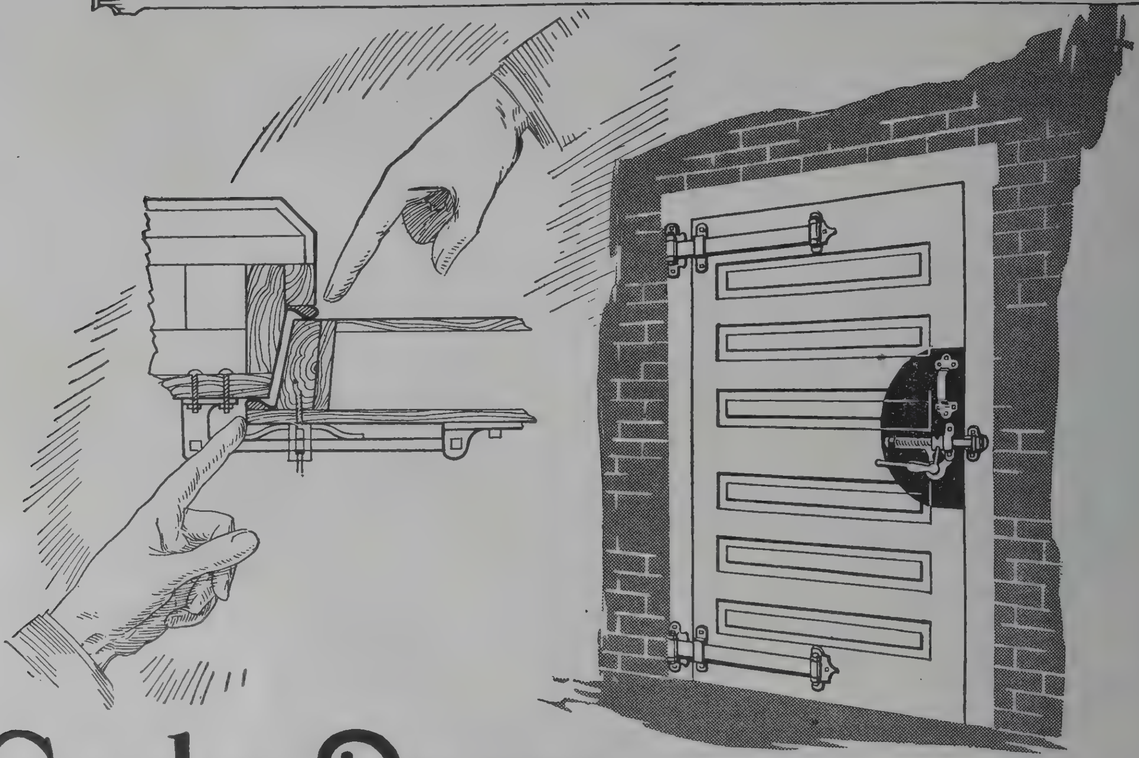
FACTS ABOUT COLD STORAGE DOORS ~ *No. 4 of a Series*



Cooler Doors ~
must have double *seals of contac*

Jamison Doors
JAMISON COLD STORAGE DOOR CO.

Our new catalog No. 13 gives complete information on Jamison Cooler and Freezer Doors, Automatic Ice Chutes and other Jamison Products. A. I. A. File No. 32C 1.

SPECIFICATIONS for a cold storage or refrigerating plant are a brass-tacks matter. Doors, for example, do not rest between the bronze portals the president favors and the panelled doors the treasurer prefers. Cooler and freezer doors have *work* to do.

Even a perfect door in a perfect wall is deficient—if the lines of contact are not complete. At every point of contact, Jamison Cooler and Freezer Doors are *doubly* sealed. No single gasket, however tight-fitting, can give the absolute proof against leakage that the confined dead air between these *two* seals provides.

The double seals of contact principle costs more. But air leaks cost still more, and the Jamison method definitely minimizes temperature losses. . . Other points of Jamison construction have proved themselves creative of higher refrigerating efficiency. Heavier, surer pressure hinges; slam-proof Self-Tightening Fasteners; higher standards of insulation. And the fact that we have a large stock of standard size doors on hand ready to ship *now*.

Our catalog puts the whole successful story in your hands. May we mail it to you?

The "ARISTOCRAT"

OF BOTTLE CLEANERS

APTLY NAMED BECAUSE IT IS IN A CLASS BY ITSELF

Above cut shows TWO large ARISTOCRAT units consisting of independent 5-COMPARTMENT SOAKER connected to our latest hygienic BRUSHLESS WASHER with Sterilizing and 3-Compartment Cooling attachments. Photo was taken on the assembly floor of our large modern factory.

These units are now being installed in that new wonderful plant of SIDNEY WANZER & SONS, INC., CHICAGO, ILL., where the best was the main consideration. Write us for full particulars. Our engineering staff belongs to you. 26 years experience.

Sheffield Farms selects Barry-Wehmiller Bottle Washers, Soakers and Sterilizers for their *new Jamaica*, Long Island Plant. After using 2 Barry-Wehmiller machines for more than 2 years in their New York City Plant, 2 more at the Brooklyn Plant, 2 more at the Harlem Plant, and 2 more at the Bronx Plant, all of 6 to 8 compartments in size, they have for the *fifth time ordered 2 more for their new Jamaica Plant.*

View of a Miller installation at the Esmond Dairy, Sandusky, Ohio

Chemically Clean Bottles —At the Lowest Cost

IN the Miller Hydro there are no germ-laden brushes to contend with . . . no delicate mechanism . . . no parts that easily wear out with the brushes. Instead, this mechanically perfect soaker year in and year out goes regularly about its business of producing a continuous stream of chemically clean bottles at almost fifty per cent less washing cost.

The Miller Hydro can never wear out. No one has ever discovered a worn-out Miller Hydro even though 3500 machines are in daily use. It is built to give a lifetime of bottle-washing service free from any sort of expensive brush mechanism.

If you consider that the work of a soaker is to polish and scour every dirty bottle to a thorough degree of sterility at the lowest possible cost . . . then you owe it to yourself to install a Miller Hydro. It will soon pay for itself out of wasted profits and the satisfaction it gives will be worth ten times the reasonable purchase price.

Write us today for catalog and names of large dairies who have tested the Miller Hydro under every condition.

your business

—for the Milk and Milk Products Industries

From more than Twenty-Two Million milk cows in the United States come products each year which exceed Two Billion Dollars in value. Between cow and consumer more than Fifteen Thousand firms handle these products—mainly milk, ice cream, butter and cheese.

Milk is indeed perishable. It must be handled with speed, with care and on a rigid time schedule.

In this exacting service several thousand Graham Brothers Trucks have added their performances day after day—in all sections of the country and under all conditions of road and weather—to the universal reputation of Graham Brothers Trucks for power, sturdiness, economy of operation and dependability.

Graham Brothers Trucks and Commercial Cars meet 91% of all hauling needs. They are sold complete with bodies to fit your business. Only great mass production makes such low prices possible.

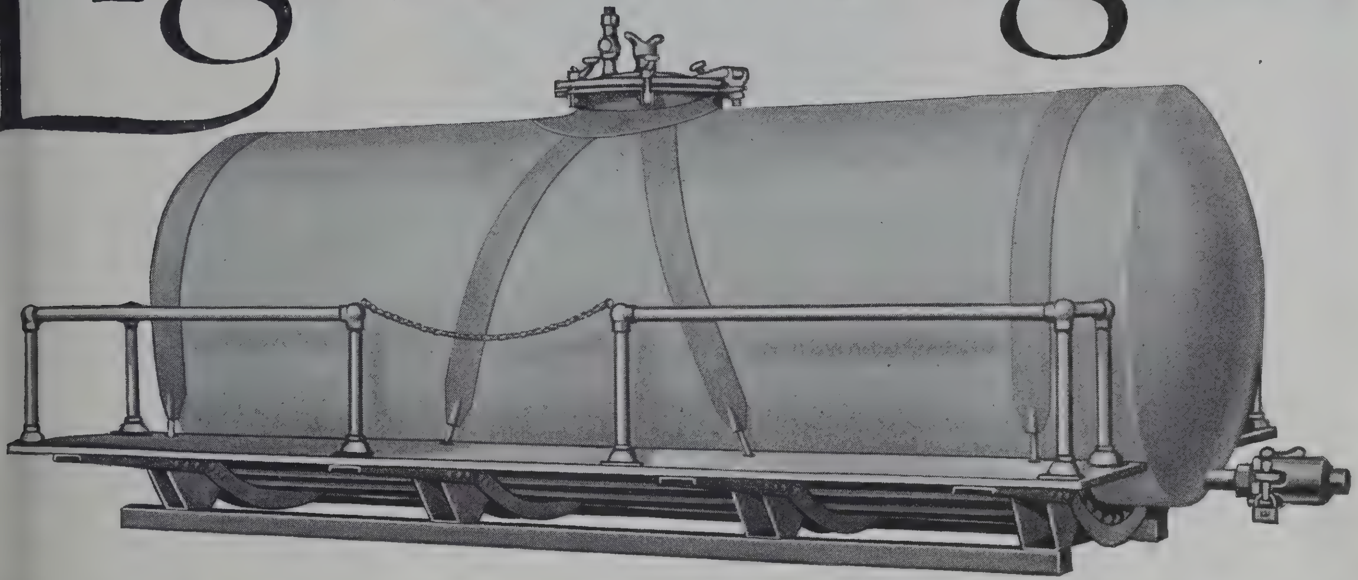
Light-weight



GLASCOTE

Truck Tanks

USERS of Glascote Lightweight Truck Tanks are hauling 1200 gallons instead of 1000 under same road laws and saving time and expenses in proportion.

Glascote Tanks have perfectly round dished heads welded into a circular body, making the strongest possible construction.

Glascote mounting is designed to cradle the bottom of the tank completely, with cross members built like the chassis of a truck, giving the maximum strength and support with the least weight.

Glascote Tanks are cork insulated and have welded sheet aluminum protecting jackets, finished to take paint.

Equipment includes pressure and vacuum gauges, platform, railing and outlet valve with protecting cover and lock.

INCO NICKEL

A 28-page Cooperative Insert Which Definitely Proves that INCO Nickel is THE metal for Dairy Equipment

WHEN the leading factors of the dairy industry join in the publication of a 28-page advertisement emphasizing the superiorities of one material, users of dairy equipment may well pause to consider the significance of such an effort.

It will be well worth your while to read their advertisements and consider not only their significance, but their message, as well. They prove that Pure Nickel protects your product from contamination, that it is easier to clean, and is more durable and sanitary. They also show that you can secure the finest equipment obtainable, made of Pure INCO Nickel.

Even though you did not see this insert when it appeared in "The Milk Dealer", you can obtain YOUR copy by writing direct to us. Send for it today!

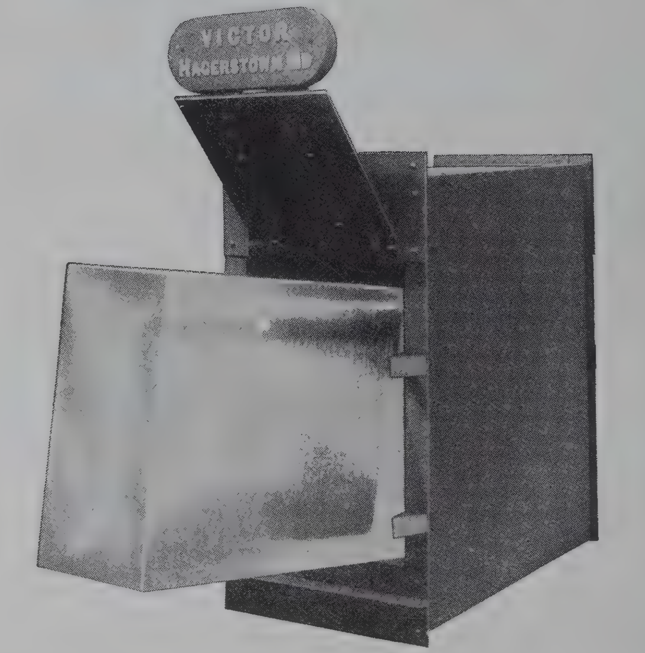
Conserve!



To conserve is the first reason for refrigeration. Save ice,—eliminate spoilage. Victor "All-Steel" Ice Chutes are built with this thought of conservation of ice paramount.

Victor "All-Steel" Ice Chutes are constructed with patented curved door, cork insulated, carefully fitted with waterproof gaskets at points of contact, pivoted on cold, rolled steel shaft, carefully balanced, and require no springs to operate. No wood is used in the construction of Victor Chutes, all joints are riveted, with no bolts to work loose.

The photograph on the left shows installation in Ice Storage Room of the J. M. McCoach Cold Storage Company, Huntington, W. Va. Note the delivery end of chute and trackway for rapid handling of ice, in the lower right corner.

A postcard will bring you complete information as to the possibilities of Ice-Conservation in your plant, by the use of Victor "All-Steel" Ice Chutes. Address all correspondence to Hagerstown office.

GLASS ALL THE WAY!!

Glass all the way means sanitation all the way. Any dairy operator finds it difficult enough to keep the plant sanitary without inviting additional hazards in the form of unsuitable equipment.

In all the years of progress no material has ever been devised that will take the place of glass. Metals are still subject to corrosion; wood is difficult to clean; consequently glass alone remains supreme!

By virtue of its inherent advantages over other forms of material, the suitability of Pfaudler glass for the Dairy Industry needs no further proof! Write for our Catalogs 673, 674 and 680.

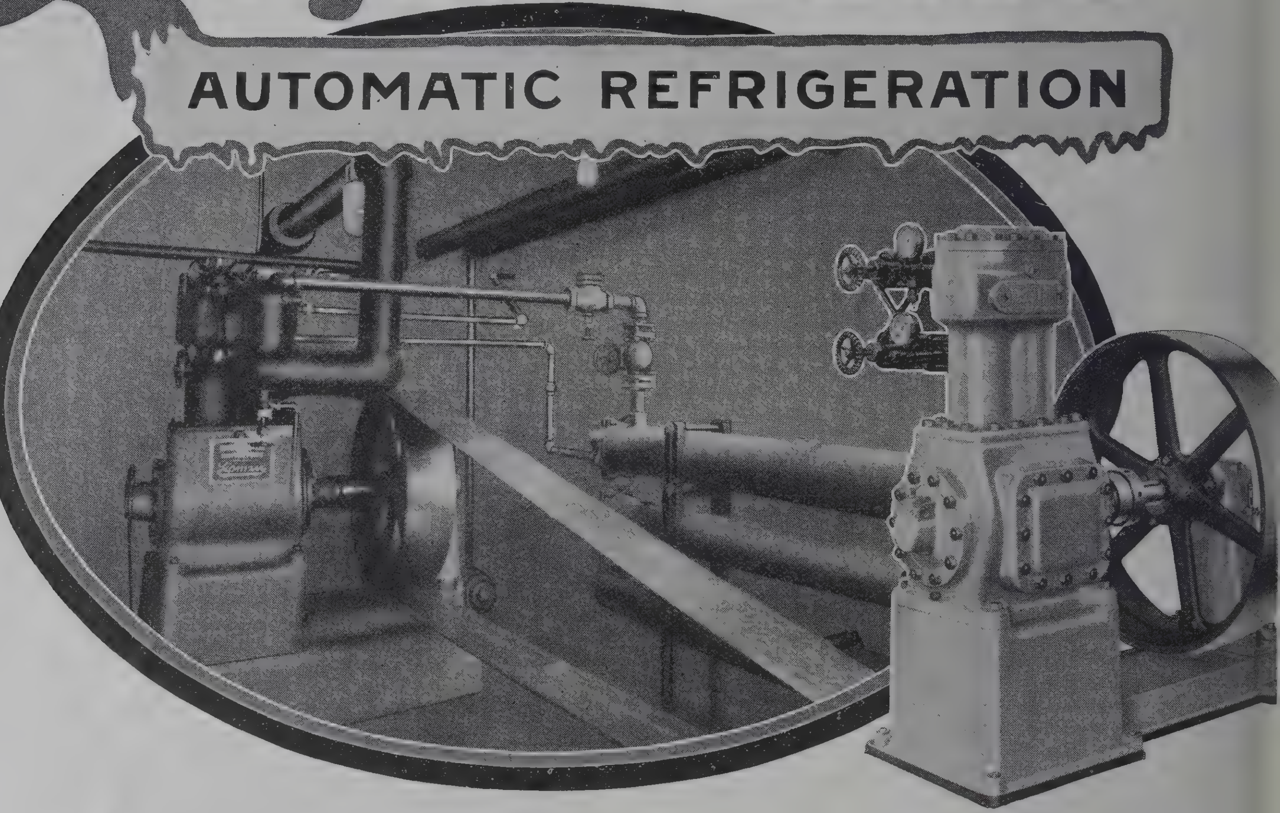
Lipman

AUTOMATIC REFRIGERATION



"Same as our Salt Bill"

The Martin Dairy Company, of Little Rock, Arkansas, writes that "the operating cost of our entire plant, which includes one 30 H. P. motor on compressor, one 10 H. P. on marginizer, one 7½ H. P. on milking machine, one 2 H. P. on pasteurizer, one 2 H. P. on ice crusher, one 2 H. P. on well pump, one 1 H. P. on brine circulation and one 1 H. P. on water cooling tower is approximately the same as our salt bill when using the old ice and salt methods.

"This machine operates automatically and is giving us entire satisfaction."

Milk Dealers are invited to write for our folder on refrigeration for dairies. Sent free on request.

The Martin Dairy is refrigerated by one of our Model 3000 machines, the compressor of which is shown above. This Model has proven well-adapted to dairy refrigeration as it is very economical to operate, very rugged and dependable, and seldom needs attention. Controlled either by thermostat or by hand.

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

APRIL, 1927

BULLETIN *of* EVENTS

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.

American Dairy Science Association—Annual meeting to be held at the Michigan State College, East Lansing, on June 22, 23 and 24, 1927. Secretary-treasurer, G. C. White, Storrs, Conn.

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive. Roberts Everett, 1328 Broadway, New York City, secretary and manager.

International Association of Milk Dealers—Twentieth annual convention to be held in Columbus, O., on October 19, 20, 21 and 22, 1927. The Neil House will be convention headquarters. Secretary, R. E. Little, 139 N. Clark St., Chicago.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

THE National Dairy Union cannot lay claim to being the oldest dairy organization but it can well claim to being one of the most successful. It has been in existence over 20 years. That covers a period which possibly is the most important period in the history of the dairy industry, past or future. A man who is so fortunate as to have been active in the industry during the past 20 years is in position to make comparisons and to appreciate the present efficient methods employed. When he contemplates the crude methods and practices of 20 years ago, especially in the manufacturing end of the industry, he can understand what wonderful progress has been made. It doesn't seem possible that the same progress can be made in methods and practices in the next 20 years.

During the past 20 years the National Dairy Council has come into being, and breed associations and
dairy schools have made their greatest development.
present day manufacturing and distributing me
were almost unknown 20 years ago. During this p
when such splendid advancement has been made
National Dairy Union has been functioning faith
and well. Through all these years it has had an a
single purpose and it has held to that purpose. It
well be termed "the watch-dog of the dairy indus
It is entitled to our continued support.

* * *

MOST folks are content with modern progres
quite willing to pay the price for it in the ca
most things. Some of them don't like it as it appl
the milk business. They know it costs more to ma
the family automobile than it used to cost to oper
top buggy, but they are willing to pay the pric
they attempt to reconcile the present prices of m
milk with the established price of long ago, they
only of the increased cost to the farmer. Then
they learn the price the farmer is paid for a qu
milk they think of the price they are paying and
hold up their hands in holy horror.

Not all consumers of milk make this error, of c
We are only considering those who are quite in a
with the fellow who doesn't know the war is over.
is an ever increasing large number of consumers
fully appreciate the changed conditions, most of
have been created for the consumer's benefit, not to
life more miserable for him.

The men in this milk industry have the job ah
them to educate the consumers of milk to a high
preciation of the service that the modern milk dist
ing organization renders. Most of our large deale
carrying on campaigns of education all the time.
rightfully consider the cost of these campaigns as
did investments.

Some of these campaigns do not sufficiently e
size changed conditions in the industry. They ar
heavy with facts about the food value of milk
that no one can successfully dispute. The consume
be fully convinced of the true food value of mil,
ugly obout the price asked for it. The milk that h
chased years ago at five cents a quart had quite as
food value as milk for which he may now pay the
four times as much.

He is thinking of food values in terms of "
units," or "calories," or "vitamines," or someo
more or less mysterious factors that make up hi
vidual measuring stick by which he judges food
and he is fully justified in doing so if he is not told
other values. He cannot be blamed for overlookig
value of purity, wholesomeness and service in hi
supply if not informed. During the good old time
dreaming about the city in which he lived pa
enough cows in the outskirts to provide the ne
supply of milk for the inhabitants. As the city
pasture lands became populated suburbs and cow
moved out into the country. Transportation pr

eased and the city milk distributor, with his horse- vn vehicles, was compelled to invest vast sums of ey in country receiving plants. Thousands of these ts now stand as monuments to changed conditions ie milk industry. Increased population has favored building of branch distributing plants and col- ng and delivery systems have been revolutionized. ines have been invested in expensive, necessary pment and the cost of operation and upkeep of this pment must, and of course is, added to the cost of .

'he cost of collecting, pasteurizing, clarifying, bot- and delivering a bottle of milk which the consumer s on his doorstep, no matter what weather condi- s may prevail, is high, but the consumer is the fel- who is benefited most by the changed conditions. should be and is willing to pay the price when he is aware of the facts. He wouldn't want to go back ie old "dip and carry" system of running the milk ness when milk was produced within the city limits. all our campaigns to increase the consumption of , let us not forget to set the consumer right on this stion of price. Keep right on talking food values but is also tell him the other valuable considerations he etting when he buys a bottle of milk produced in of our modern milk distributing plants.

* * *

'O ONE, we are sure, will think it strange that we believe in advertising. We also like to see other s act as if they believe in it. That is the reason we e pleased one day recently when an illustrated four- e folder, advertising the Columbus, O., convention hed our desk.

'hink of it! The convention doesn't happen until t October and here we find Secretary Little adver- ıg it in March. That is what we call real aggressive ertising.

* * *

'EW thoughts along the line of milk merchandising may be opened up by an article in this issue en- d, "Important Facts that Formerly Were Overlooked Iilk Merchandising." In a large way this is some- t of an indictment against our vision of advertising ibilities in the milk industry.

Regardless of what we think of this article and its ts against milk dealers, all of us should make up our ls to tell the milk story more clearly. Let's paint a , strong picture of milk and its benefits. Let's g out in a striking way what it stands for in human rs, "not what it **is**, but what it **does**," to paraphrase. Iilk is not just milk; it is a vital factor in life, just eal as any of our senses, emotions, feelings. It is gy, effort, achievement, success, victory, triumph. he past we have been selling milk. Now let's get n to business and sell the most important part of merchandise—the victory of milk.

'hat milk advertisement is not altogether complete h does not paint a picture of human satisfaction.

A BUSINESS must make money if it is to survive. A man with plenty of capital can lose money temporarily, and even enjoy it, if he is convinced that he is building for profits to come later. It's a dangerous position to be in, though, even temporarily.

A man with a good milk plant in which a considerable amount of money is invested, but who has few customers for his milk, is much in the same position that the editor finds himself in when he faces a piece of white blank paper with a long, sharp pencil, and nothing to write. Having been in this position, we are prepared to sympathize with anyone in it.

In this position one is in need of ideas. For ideas are the things you sell. People are not sold on milk; they are sold on the idea that it is good for the health of themselves and their children. Some may drink it for other reasons, but it is certain that no one buys it just because it is milk.

The milk business is going forward today on the vehicle of ideas—the presentation of ideas which make others want to have that which you sell.

The trouble with most of us facing the blank space is the habit of waiting for the ideas to come to us. If the editor had to wait for his ideas to walk right out before his eyes and say, "Hello there, aren't you glad to see me?" you might miss several issues of your paper. For ideas don't come to you, as some of us thoughtlessly say at times; they have to be sought out and dragged forth.

Ideas are merchandise. People pay big for them. The men selling the most milk are the men developing the best ideas.

* * *

WE KNOW a milk dealer who lost several good customers on a certain business street in a certain city because he didn't have the right sort of a salesman on that route. His customers had no complaint about the service they received, but they didn't like his unnecessary noises. On Sunday morning, particularly, when they were trying to get some extra sleep, this particular driver seemed to feel it his duty to wake up everybody in the neighborhood. On Sunday morning he was usually accompanied by a friend who evidently was busy elsewhere on weekday mornings. These two fellows made a lot of wholesome noise, calling to each other from various vantage points on the street; that is, their noise was wholesome to them, but not to the disturbed residents. Several of the ladies finally got their heads together and agreed not to patronize the dealer represented by the noisy driver.

The milk dealer may feel that he has some pretty exacting customers and that they expect too much in the way of service, but if he wants to hold their patronage, there is only one thing he can do, and that is to study their whims and humor them. Possibly that noisy driver who waked up his customers on Sunday mornings was contributing to the health and well being of those customers, but they didn't appreciate it.

Important Facts That Were Formerly Overlooked in

Milk Merchandising

By a Staff Writer of The Milk Dealer

Stronger Appea Necessary in Describing Wha Milk Does Fo Health Tha Simply Describing What Milk I

ADVANCEMENT in milk merchandising, the trade observers will agree, is coming through keener appreciation of the importance of creating a clearer picture for the background of dairy health. The merchandising art is the pillar of dairy economics, the very warp and woof fibre of the industry's structure. Yet it is only in quite late times that we have even approached anything like an artful manner of telling our sales story in this industry.

We haven't gone far yet. Although there has been noticeable increase—quite noteworthy increase, indeed!—in the advertising of milk and other dairy products, this industry for the last several years has followed in the hackneyed, stereotyped grooves of everyday advertising—except for a little spurt and flash now and then.

That little spurt and flash represent a regeneration in the industry.

Advertising. We are just now beginning to learn what it means. Formerly we turned to advertising because it was the thing to do. The sheep mind that controls most of us led us into widespread advertising of milk. It was not through any particular industry-thought that we were guided; it was more because of a sort of copy-book-maxim implanted in our minds regarding the value of advertising. Like "honesty is the best policy," we heard for so long the hue and cry that "advertising pays," that we soon, as a matter of course, began—advertising.

Serving the Purpose of Printed Salesmanship.

It is now clear that the milk industry did not lay down in the beginning, as it should, an advertising structure that would fit the peculiar aims of milk salesmanship. In other words, we just advertised — advertised milk and nothing more. To a great extent we still are following this practice, though here and there a brave spirit raises its voice once in a while to show that somebody dares to THINK in their selling campaign.

Advertising that does not present a true, clear picture of what milk **does** instead of what it **is**—that sort of adverti is far from serving the full purpose of printed salesm ship.

Milk as a commodity is pretty well known, since the oldest food product known to man. But milk builder of men, as a savior of childhood, as a blessin motherhood—that part of the story has not been cle pictured.

Printed salesmanship must be natural—must c the ring of reality. If it doesn't, it falls flat, just good story must ring true to life, just as a high v of art must give the natural at phere and make you feel that know such a scene, that you member having seen one.

In the last several mont have gone over a large numbe newspapers searching out mil vertisements, this with the id finding out what milk dealers doing in their selling campa just where their thoughts lie. results were not very encoura Many were just alike; nearl carried pretty much the thought, the basic thought "I want to sell you milk." ing particularly interesting that; it would be quite stran the milk dealer didn't. But —very few—brought out a pi that **could make the man i streets want to buy milk!**

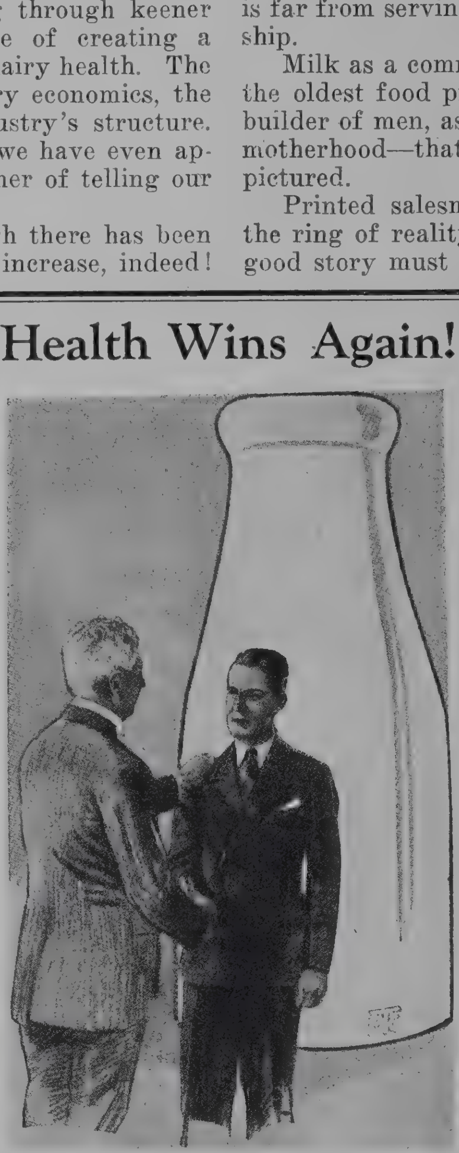
That's Art, with a capital

The Odd One-Tenth.

On the basis of my recen quiry through the advertising umns of a number of newsp I am prepared to believe that hundred and ninety-nine and tenths milk dealers are adv ing milk and nothing else. odd one-tenth is advertising more or less proper way, the story of why people should milk and more milk, why it m more to their health, happ and efficiency.

About the only thing tha average milk dealer can about is milk is wholeso "healthy," most of us say. is a grammatical point we do well to correct. For m not **healthy**; it is **wholeson**;

Health Wins Again!



PROMOTED!

"Jim," said the president, "you have made a fine record here. As a reward for your energy and achievements, we have decided to promote you to the head of the sales department—I congratulate you."

Rugged health, built on a balanced diet, with plenty of rich, bottled milk, was largely responsible for Jim's promotion. It had enabled him to work hard and to think clearly—two essentials to success. Thus, as usual, promotion went to the one mentally and physically fit.

You, too, can become fit and KEEP fit by proper eating and healthful living. By all means, include in your diet plenty of pure, rich, bottled milk—the greatest health food in the world. Authorities say drink bottled milk at meal-time and between, too.

s **men** healthy! You might as well say milk is y when it is **not**; it makes **people** happy.

is not for milk alone that men pay their money to men. True, most of us like milk, like the taste and of it, and most of us know it is appetizing, satisfy- But the great volume of milk sold today is sold gh the compelling thought that it will benefit us.

e must build up a greater, clearer, more vivid pic- or our background of dairy health. We must make er appeal to the imagination. We must study man- and mankind's peculiar habits and tendencies. We study human nature. You may rest assured that the other great industries have done much study- and still are studying—along this line. But they udying from the peculiar angles and viewpoints of industries, and we shall do well to keep far from thoughts, using our own original ideas that fit our eculiar angles of merchandising.

e can take tips, of course. We have done well with hild appeal—extremely well. It is to be wondered, gh, if we haven't overdone it. Possibly not inten- lly, but because we did not know how to get off the ct, perhaps, but the fact remains that we have just worn "mother's darling" threadbare.

's time that we give a little more thought to mother lf, and to dad, and to growing-up boys and girls. kindergartens and the schools and the various wel- organizations are taking pretty good care of the er people, but what are we doing to carry our sales age to the grownups in a convincing way? It stands ason that our "fairy-tale" way of telling the milk won't do at all in this larger, more ambitious field inted merchandising, where men and women want stories — even their romances — to be real.

Looking for Facts.

is peculiarly a realistic age, an age in which men women frankly face facts that formerly they blushed the dark. It is an age when men and women calmly the printed merchandising of articles of such inti- personal relationship that they formerly never even ioned in polite conversation, even to the closest of ds.

his does not mean that, although we are more of a rial and realistic people now than ever, we want to up the romances of life. Ten thousand times—no!. e the contrary. In this highly developed age of manship the merchandisers are calling upon all the of romance, all the sunkissed isles of fancy, all the als of adventure and daring, all the gods of the ents; and in this way building up illustrations for nost highly colored background possible, these tal- l merchandisers then draw upon their finest of ses, their most splendid rhetoric, their tersest, most riptive adjectives, all to show why the public ought y one particular kind of — what?

oilet paper!

A Picture.

efore me now as I write is an open page in one of reatest magazines in the world, a magazine that is ted with selling more merchandise for manufactur- nd producers than any other publication in the l.

here is a wonderful full-page advertisement. You at the beautiful illustrations a long time without ing just what the advertiser is seeking to sell. He es that illustration so vivid, so beautiful, so highly ed—and at the same time so natural, life-like!—that enjoy looking at it. It is a picture of a room full ndsome women, a well-appointed room with women well-dressed, modestly dressed, in good taste. All eyes of the women are in one direction—toward a beautiful winding staircase. The staircase is made the most outstanding "still" subject in the picture. But even more prominently shown than the staircase is a single beautiful woman moving down the stairway, slowly gliding along, every graceful curve of her body shown and she carries herself with the stateliness of a queen, yet with a pleased, happy look in her eyes.

The picture seeks to portray a woman of poise, a woman enjoying the happiest moment of a woman's life, a moment when she can, with perfect ease and satisfaction, walk into her living room and find gathered about friends and companions whom she knows and loves and is eager to be among.

Oh, but the story that illustration alone tells, without the need of words, without need of explanation! Nothing could be more charming, nothing more realistic and, at the same time, more appealing to fancy and imagination.

Yet, do you know what that advertisement was selling? An article of such humble purpose that it could not possibly be the subject of discussion among any group of people, not even among men—well-bred men, anyhow. It is just one of the things that we know exist, like the contents of the sewers, but just don't let our minds dwell upon.

Build a Sales Background.

The point I am trying to make is this: If all the grand magic of advertising art can be called into play to picture the benefits of so many obscure, humble and absolutely impossible commodities of sex and person, then in heaven's name why can't we, with the most romantic, the most inspiring product in the world, build up a sales background for milk that will fairly arrest the attention of everybody, gripping the imagination, seizing upon the strongest conviction, slashing to the bleeding vitals of an awakened health conscience!

Before we can sell milk we must tell what milk does, and then go farther. If it makes us healthy, we must tell what health is, for some of us human beings haven't any imagination to speak of enthusiastically. Health is happiness, achievement, a well-ordered, well-rounded life that is going somewhere, enjoying its every hour, drinking to the fullest of success at work, at play and at home. That's what people want in this world—success, well-being! Then let's play success, well-being to the limit!

Although we have many ways of seeking it, and although any competent philosopher or psychologist will tell you, most of us are going exactly contrarywise in the quest, the fact remains that the dominant thought in the lives of all of us is to be happy. It is the greatest human urge since the first man and the first woman began this strange puzzle of life.

Then let us show, in a highly colored background, what milk offers to health and satisfaction—to achievement.

Note the milk advertising in the papers and magazines you read. Study these advertisements and decide for yourself if they are good, bad or indifferent. Study them carefully and thoroughly, as though you were a man in the street, and then ask yourself, "**Would these ads make me want to buy milk?**"

That is just what every merchandising milk dealer ought to ask himself about every kind of advertising or other form of merchandising that he puts out—"Would this argument be convincing to me, a man in the street, and make me want to buy milk?"

Why Johnny Likes Mil

By HOLLIS S. STEVENSON
Illustrated by CLIFFORD B. KNIGHT

"Come, on, Johnny, drink your milk!"
"Aw, I don't like milk!"
"Well, eat up your prunes then."
"Shucks! I don't like prunes either."

MILK or prunes, Johnny just will not eat them if his mind is set against it. Maybe you can force them down his throat. But what good will that do?

But give Johnny an incentive. Then watch him go after that glass of milk! And he'll not only use up his quota, but in all probability he will persuade his friends to do likewise.

The Birth of an Idea.

And that is the basic idea of Uncle George's Kiddie Club, sponsored by the Mitchell Dairy Company in Bridgeport, Conn. Feeling the need of tying up with its best prospects, the children, the Mitchell Dairy welcomed the opportunity to put on a children's feature over the air. First of all, a three months' contract was signed with the local broadcasting station, WICC. A nominal rate was secured for "local circulation." Then, we engaged the services of a local cartoonist who was already a great favorite with the children. Every Monday night for a half an hour Uncle George related to the kiddies a chapter of the story of "Buster." This was no stereotyped children's story culled from a library book. It was an original real kid yarn, based on some of Uncle George's experiences with children, and containing a well-balanced tie-up with milk.

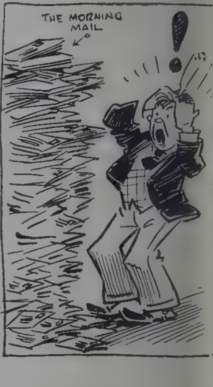
The Mail Problem.

Then the mail started to trickle in. The first week or two, Uncle George read the letters received during the previous week. But like the growth of a snowball, this mail soon began to assume unwieldy proportions. It became apparent that we could not hope to read all the letters that were received in one week. We found it necessary to prepare typewritten sheets containing digests of every letter. Every Monday night, Uncle George would wade bravely through this data, reading as many as he could, barely getting time to include the story. At best, he could not cover more than 40 or 50 in one evening. One night, when Uncle George was ill, "Uncle Charlie," the station announcer, pinch hitted for him and managed to read 107! However, it took him some time to recover from the effects. Uncle Charlie kept saying, "Oh, dear, what a lot of letters. Will I ever get through?" The next week's mail brought many a reference to Uncle Charlie's comments. And the mail kept growing until from 50 to 100 letters in one day was not an unusual mail. Not only did Bridgeport respond, but many towns in the state and others, away beyond our trading area were heard from. In fact, later on, we had to discontinue the reading of out-of-town letters, in justice to our local listeners.

The children did not hesitate to unburden their li
hearts to Uncle George. They told of their pets, t
parents' peculiarities, the amount of milk they consu
and many other interesting anecdotes.

For instance, Mary told us:

"Daddy just surprised Mother and I with a ra
It was quite dark when it arrived, and we were so anxious to hear it that Daddy and my Uncle Charles connected it with the bedsprings and the faucet, and we were delighted to hear your program. We had to laugh to think we heard you with this connection."



Some of the children had a distressing habit of enclosing samples of their favorite talcum in their letters. Uncle George once got some of this all over his hands and clothes, and had a great time explaining to "Aunt Georgia" that it was only a kid's prank.

Quite a few gems were culled from the mail. The
ters disclosed not a little talent. Here is one chi
efforts:

"I drink Mitchell Dairy Milk,
And so does Tabby, too.
But the way I like it best
Is in an oyster stew."

"How's that, Uncle George?"

Susie reported that her radio was raspy, but fa
had said it was because Uncle George's whiskers scra
the "mike." "Have you got whiskers, Uncle Georg

Another little girl said they used to get milk f
a cow, but now they used Mitchell's milk! Possibly,
may have been due to Henry Ford's efforts toward a
chanical cow.

Francis evidently knows the value of milk. Fo
put his thoughts in verse:

"If you can buy a dress of silk,
You can buy a quart of milk,
Because milk is 16 cents a quart,
A dress costs $16.00 just to sport."

Just as children think their father can do anyth
our kiddies had the idea that Uncle George was a j
of-all-trades. "My father bought us a goat, but we c
know how to milk it. We wonder if you would c
out to our place and milk it, Uncle George? We
Mitchell's milk." Fearing to lose a good customer
refused to consent to Uncle George's compliance
this request.

Johnny claimed that they raised the biggest r
melons in the world over at Long Island. "Why
grow so big that people go crazy after eating t
melons. Won't you come over next summer, U

e, and eat some of our melons?'' Absolutely not! rain of the program was beginning to tell on Uncle e as it was, and we weren't taking any more es with Uncle George's reason!

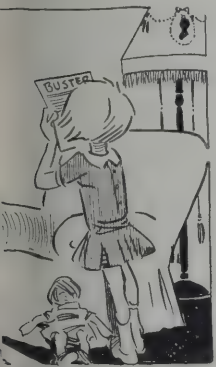
d probably the prize letter of them all contained ggestion that we let Billy bring his parrot over to udio to boadcast! In a rash moment, we agreed to Polly a tryout. But we stipulated most emphatical- t she must come in her cage. The station director utely refused to allow any wild birds to roam at large in his broadcasting studio. Greatly to our relief, the parrot developed a cold, and her debut had to be postponed. Whether pneumonia set in or if Polly recovered, we never did hear. If the truth must be told, we lost interest in the bird, and made no further inquiries as to the health of the patient.

The Idea Grows.

At this stage of the game, the question arose as to what use we should make of this steadily ing mailing list. And right here we formed a y that has been largely responsible for the suc- of the project. We decided to avoid any at- t to exploit the children for commercial purposes. you build up a good mailing list the natural nation is to work it to the limit. This tendency has largely responsible for the early demise of many a shing kiddie club.

e relied on wholesome entertainment to secure the will of our young friends. Milk was only men- d incidentally, and then from a health point of view. wanted the children to absorb the idea of a daily n of milk, through the influence of Uncle George. we supplemented his talks and stories with a little let on milk, containing outline pictures for the kid- to crayon.

t no time has a child been asked to drink Mitchell's . Even at that, many of the children have written say that they were boosters for our milk. And, the very first, the kiddies told us of their own d little stories about milk, and made up little s about it. We believe the parents have appreciated fforts in behalf of their children. For many of them have written in, telling of the enthusiasm of the youngsters for Uncle George and his program.



Children Love a Party.

Someone suggested we invite a few of the children down to the studio to see in person how broadcasting was done. So, we chose a half a dozen at random for the first night. After they had watched Uncle George do his stuff, the youngest was asked to pick six more for the wing Monday's studio party, by drawing six letters the mail bag. An interesting feature was that the l invariably chose the letters enclosed in colored lopes. The children were also allowed to say a piece greet their folks over the radio. We served some of hell's ice cream to our little guests and sent them home thrilled. These parties, of course, had a wonderful stimulating influence on the mail received.

Just previous to Hallowe'en we invited the entire membership of Uncle George's Kiddie Club to a Hallowe'en party at the dairy. Invitations were mailed to about 150 children. Did they respond? Yes. As near as we could figure, about 300 folks turned up at the dairy. They brought their friends, cousins, parents and sundry acquaintances. A local radio store hooked up a receiving set at the dairy for the evening. They listened to Uncle George for his usual talk. Then Uncle George appeared in person, accompanied by ''Ebeneezer,'' his hired man, another character that he had created in the story of ''Buster.'' The children nearly went wild with joy and excitement! A number of the kiddies themselves helped with the entertainment, in addition to the two favorites, Uncle George and Ebeneezer.

Big-hearted Uncle George, anxious to give the kiddies the time of their young lives, had engaged the services of a local magician. ''The magic man,'' as the children called him, brought along an amazing amount of paraphernalia. Included in his repertoire was the familiar trick of taking a rabbit out of a tall silk hat. In this case, being unable to secure the rabbit, he managed to pick up a couple of guinea pigs. When these little animals weren't crawling through the files in our office they were scaring the life out of our night watchman, who began to wonder whether this was a dairy or the winter quarters of the circus. After the perspiring magician had completed his trick, Uncle George presented the animals to a pair of twin sisters, much to the relief of the dairy officials, who were delighted to see the pets safely out of the building. The presentation was made not without a struggle. For, a dozen or more pair of hands all tried to receive the gift at once, which threatened to be disastrous to the poor guinea pigs.

Later, Uncle George received a tear-stained letter from the little girls. ''Uncle George, do you remember the guinea pigs you gave us that night at the Hallowe'en party? We are awfully sorry to tell you they died last night. They seemed very unhappy!'' Maybe it was just as well that they departed this vale of tears!

Ice cream and cookies were served, and the children were finally returned to their families. And then we made a solemn vow that ''never again would we hold another party at the plant.''

Shortly after the Hallowe'en party we decided to extend the broadcasting to a six months' period. Having developed such an enthusiasm among the kiddies, we were naturally anxious to get full returns from our efforts.

Cashing in On the Investment.

This entertainment certainly created good-will, but how could we get any direct benefit from this form of advertising. At this point we took stock of our assets. First, we had a mailing list of nearly 2,000 healthy, lively children. Second, we had Uncle George, a personality the children all loved and respected. And, most important, we had an investment that, properly developed, should result in sales of MILK. So, after six months of broadcasting, we decided to form the Kiddie

Club into a permanent organization. On the last day of broadcasting we announced that we would be off the air for a while, but that in a few days we would announce a new feature.

Uncle George's Kiddie Club is Launched.

Within a week each member received the first issue of "Buster," their own monthly magazine, a four-page house organ. This contained a chapter of the story of "Buster," extracts from some of the most interesting letters, an editorial by Uncle George himself, and a short message from the dairy. Enclosed was an application for honor membership. Each child was told that if he would agree to drink at least two glasses of milk a day, he would be put on the honor roll, and would receive a beautiful honor member's button (see facsimile of design on membership card. This was also used on letterheads. Lettering and illustration in black ink on a solid orange background. All other stationery, membership cards, etc., were imprinted with this button design.) The application had to be signed by the parent or guardian, so the folks would know what the child was doing.

The letters that have come in since the applications went out have been even more interesting. One youngster reports, "I am sorry to say that my mother has been using Blank's milk for the last 11 years"—even though we hadn't asked her to drink our milk. Another states, "I drink lots of milk. My pa keeps a goat." Best of all, Willie writes across his application, "Please send Mitchell's agent to our house." And so they go.

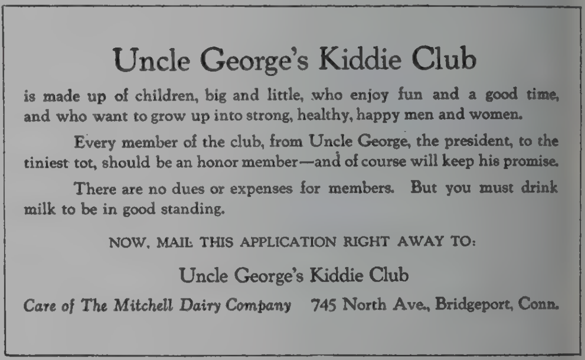
The Human Element.

The big feature of the whole campaign is, of course, the personal element. We plan to mention the children's birthdays in the month on which they occur. When it is found that milk is not purchased through our dairy, Uncle George sits down and writes a jolly personal letter to the kiddie, saying in an off-hand way, that he noticed that Johnny's folks don't get Mitchell's milk, but assuring Johnny that he isn't particular what dairy they buy from so long as Johnny drinks his two glasses of milk daily—which is the one and only stipulation on w he may become a member of the Kiddie Club. He writes a letter of sympathy in a case of illness, and every possible excuse to keep in personal touch with members.

These letters have given us a better idea of the situation locally. We feel that we have created a will that could not have been otherwise obtained, that our whole campaign will do its share towards s ulating the increased use of milk. As for actual s while no doubt a number will come in direct (and have been able to trace a few), the results will be ref ed in increased orders turned in by our route-sales For, when all's said and done, the sale is usually m at the point of contact, the route man. But he will a much better reception when he solicits the family Kiddie Club member. And, let it be clearly underst there is no direct solicitation from our mailing list. will not break faith with our members.

What to Avoid.

If we were to start all over again, there are many falls we would avoid. Studio parties would be held a month, or at longer intervals. (Possibly not at Many children appeared at the broadcasting station invited, and we hesitated to send them away. Ama talent for broadcasting would be carefully hand-pic We would eliminate young enthusiasts who play the monica or violin indifferently—or sing the latest tunes (in a shrill, childish voice). All talent woul chosen in advance, and the children would gently firmly be made to toe the mark. Letters from ou town children would not be encouraged. While s were very interesting, yet they held up the readin letters from our local kiddies, who are our logical p pects. One way of handling this situation would b more or less ignore these communications. While s ingly discourteous, in the end it is fairer to your l kiddies.



Uncle George's Kiddie Club

is made up of children, big and little, who enjoy fun and a good time, and who want to grow up into strong, healthy, happy men and women.

Every member of the club, from Uncle George, the president, to the tiniest tot, should be an honor member—and of course will keep his promise.

There are no dues or expenses for members. But you must drink milk to be in good standing.

NOW, MAIL THIS APPLICATION RIGHT AWAY TO:

Would We Do It Again?

Having gone through the fire of an intensively in esting, amusing and sometimes troublous experience, question arises, "Would we do it again?" Decide yes. We know the children of to-day are our prosp and customers of tomorrow. We know that their pre good-will is well worth cultivating. And we also rea the influence they wield in the average family. A g illustration of this point is to be found in the cas Willie Jones. Willie had been drinking Mitchell's at recess in one of our public schools. But Willie's f take milk from Blank. One day Willie announce lunch that he wouldn't drink Blank's milk any m His folks insisted. The outcome was—Mrs. Jones takes a quart of milk from Blank. But she also h quart of Mitchell's Grade A left daily—for Willie!

GELATINATED BUTTERMILK

Experiments at Oklahoma College Prove That the Addition of Gelatine Increases Viscosity, Prevents or Retards Wheying Off and Produces a Slightly Detrimental Effect on Flavor.

By A. D. BURKE[1]; S. O. GRAHAM; C. REYNOLDS*; W. O. SELBY*; J. McCARTY**

Published by permission of the
Director of the
Experiment Station.

ULTURED buttermilk, a delicious, palatable and healthful drink, proven by extensive use, experimentation and study to be:

High in food value.

A valuable source of easily digested protein to ody.

A remedial agent in certain intestinal troubles ther diseases.

An aid to digestion.

ikewise gelatine, a palatable protein product proven imilar extensive use, experimentation and study :

High in food value.

A sparer of protein in the body.

A remedial agent in certain specific intestinal les and other diseases.

An aid to digestion.

addition gelatine possesses the distinct characteris- f being an efficient emulsifying agent and of im- ng the body, texture and flavor of dairy products ich its use has become general.

is not unreasonable to assume that a combination vo such desirable foods as gelatine and cultured rmilk should produce a product of superior ties.

survey of opinions appearing in the February issue e Milk Dealer leaves the issue somewhat in doubt health officers siding both pro and con. Those st, base their statements on the fact that aside from se of gelatine being prohibited by some state laws, a product distinctly foreign to buttermilk.

n the other hand, many dairy authorities appear able on the assumption of improved food value and ased digestibility. However, disregarding various ons, both groups closely agree on a requirement dopting universal labeling of gelatinated butter-

or information on the use of gelatine in butter- we must depend largely on a series of experiments axis (1) from which he drew the following conclu- :

1. Churn or normal buttermilk will 'whey off,' dless of whether it had been kept in warm or cold erature. The addition of 0.25 to 0.5 per cent gel- remedies this 'whey off' condition and produces oother drink which is preferred by the consumer.

2. In artificial buttermilk, where a higher acid- developed, there is some danger of using too much ine. Gelatine 0.25 per cent is sufficient to prevent ying off' for five days, provided the product is at a temperature of 40 to 45 degrees F.

3. It was observed that the addition of gelatine rtificial buttermilk retarded the development of ty in the product. This is important from an economic standpoint because most consumers prefer buttermilk with a fairly low amount of acid, about eight per cent."

M. Messcher (2), claiming to have performed a series of experiments, is quoted from a recently published letter as follows:

"I have run several experiments and find that the use of gelatine in buttermilk will be one of the main factors to make the public drink more buttermilk, for the gelatine improves the texture and especially the flavor of the buttermilk.

"I have given samples of buttermilk which contained gelatine to people who never liked buttermilk and after they tasted the gelatine buttermilk they wanted more and wished to know why they cannot buy buttermilk which has as pleasant a flavor. The only answer I could give them was that the health department does not allow the use of gelatine in buttermilk.

"If the health departments of big cities would allow the manufacturing of commercial buttermilk containing gelatine, and have the can or package properly labeled, the public would drink more buttermilk, which is now in the flush season of the milk production, run into the sewer by thousands of pounds and is a big loss to creamerymen.

"You take, for example, the ice cream. If the health department would not allow the use of gelatine and sugar in ice cream, which is a dairy by-product, what would there be left for the ice cream industry?

"I have made experiments on cultured buttermilk and used gelatine and sugar. This buttermilk was the most pleasant drink and if a milkman would put up a drink of this kind properly labeled, he would sell all of his surplus milk in the form of buttermilk, under a certain trade name, and the health department could not forbid the sale of such product for it will be a pure food and up to the standards of the pure food laws, for edible gelatine or sugar and gelatine, added to buttermilk, will be an industry, different than the regular creamery, and be a separate department, as the ice cream industry is today."

A short time ago one of us † received a letter from a foreign country indicating a detrimental effect on flavor when gelatine was added to cream in an attempt to make a heavy bodied product. Criticism was offered of an abnormal flavor which investigation proved to be due to the gelatine.

On the basis of such differences of opinion it seemed advisable to conduct more extensive experiments on the use of gelatine in cultured buttermilk to determine:

1. The effect, if any, on flavor.
2. The effect on appearance.
3. The effect on viscosity.
4. The effect on wheying off.
5. The effect on keepeing properties.

Motorizing the Dairy Busines

How One Firm Spends over a Half Million Dollars in Getting Its Products to Its Customers. 277 Motor Vehicles and 544 Horses Employed.

THE progress toward size and success achieved by the Crescent Creamery Co., with main office at 237 Winston Street, Los Angeles, since it was started here 18 years ago until the present time, has been nothing less than phenomenal. Hardly making a ripple in the industrial pool of southern California at the time of its inception, nearly a score of years ago, now it is one of the outstanding institutions of its kind in the far West. Growing constantly and steadily it has come more and more into the public eye until now its fleet of delivery trucks and wagons is one of the most common of sights on the streets of municipalities and along the highways of the state from the Tehachapi Mountains south to the Mexican border. In fact, to hundreds of thousands of the inhabitants of southern California the name of the Crescent Creamery Co. has been made familiar by this sight. Of the company, and of the immense machinery of organization behind it, the public in general knows little or nothing, but it does know the concern because its wagons and its trucks bring it constantly to mind. Therefore a brief account of this fleet, telling of what it is composed of, how it is organized, how it is managed, and how it functions, may be of interest, not only to the general reader, but more particularly to other creamery organizations elsewhere in the country.

At the present time the Crescent fleet consists of 277 motor vehicles, ranging in size and capacity from a ¾-ton truck to 5 and 6-ton trucks, and 544 horses with corresponding wagons. With this fleet the company services 125 wholesale routes and 279 retail routes, covering as with a network all of southern California. Over a half million of dollars annually is spent by the concern for the upkeep and operation of this vast fleet. More particularly, the cost of the motorized portion of the fleet is $402,450.19 a year, and of the horse drawn portion of it, $152,204.34.

It must be evident that the efficient and economical management of a fleet of this size, and the control of the expenditure of this fortune in money every year, must demand executive ability of a high order to the end that the best results shall be attained from both. In order that this might be attained the Crescent Creamery Co. instituted a transportation department just about a year ago and placed at its head a man as superintendent of transportation who is held responsible for both the efficient and economical administration of the department.

In accordance with the policy of the company to develop its own executives from the ranks farther down in its organization, it promoted to this position a man who had been serving the company for the few years preceding his promotion in the company's service department. Lee B. Bevier, the man chosen for the position of transportation superintendent, has been with
company for seven years. Prior to coming to south
California he had been a motor car dealer at Clin
Ia., where he had gained an intimate and exten
knowledge of motorized equipment, its operation
maintenance. Upon his arrival in southern Califo
he was given the position of manager for the Ora
County branch department of the company and du
the four and one-half years he served in that capa
he demonstrated his ability as a transportation ex
of parts, which reputation he extended still furthe
his activities as service manager for the company u
his assumption of that position at the Los Angeles o
so when the transportation department was institute
was placed at its head.

In his administration of his department Mr. Be
but reflects the ideals of the higher executives of
Crescent Creamery Co., so what he has to say about
manner in which he meets and solves the various tr
portation problems of the company may be regarde
an expression of what the men higher than himsel
the organization of the company, from the presi
down are striving for and hoping to attain.

"In the first place," says Mr. Bevier, "it is ne
sary to see that there is a proper apportionmen
equipment best adapted to meet the conditions and
quirements peculiar to each of the several departm
of a business so extensive as is this. This business g
very rapidly, with the result that equipment was ad
to its fleet with the immediate and individualistic n
of this or that department in mind without any thou
toward a coordination of the various fleet units to
end that each one should be most efficiently emplo
The result was that every department wanted to m
tain at all times as many units as would serve to
its peak requirements, without considering that t
so necessitated many units lying idle a goodly por
of the time in order that they might be available w
they were needed. This made for a duplication of
pensive motor units and their inefficient and unecon
employment.

"An instance in point is our peak load for ice cr
delivery is about July 4 every year. Demands for
livery at this time are enormously numerous and eq
insistent. Every unit of our wholesale fleet can be
should be in service at that time. Under the old re
many of our trucks were being held in other de
ments beyond their requirements, while the ice cr
department was compelled to go out into the by
and hedges and hire extra equipment for the occasi

"A reapportionment of our truck fleet saved the
uation last year and will save it upon every si
occasion henceforth. Last Fourth of July we did

o hire a single extra delivery unit nor did we have end a cent for outside assistance—every require- was met with our own fleet. This was accom- d by an intensive study of seasonal conditions and ements affecting each and every one of our depart- , by centralizing the control of our motor truck under one single department and giving to the de- ent the right to assign motor units here and there l when they are most needed. How much this con- es to the efficiency and economy of operation of a o one can know who has not had the experience.

Another very important function this department ed upon to perform is to see that the full efficiency fleet is maintained at all times. In other words, ust know that when we send a motor truck out it e in such condition that there shall be no reason- loubt about its completing its task within the time ed for it to do so. Every unit in our fleet, whether driven or horse drawn, must cover its assigned with all of the accuracy and precision with which ad trains are run. Especially is this essential on etail delivery routes. Every customer must be l with precision every day at the same time. Our s and wagons must be as regular as clock work. wise our business will suffer—how much it is im- ole to say, but the housewife must be served when ants to be served, else some other creamery will be to serve her. The housewife has no patience at and will neither excuse it nor make allowances for ected contingencey. Regularity is the very life r business.

This high degree of constant efficiency is attained coordination between our inspection department ur service department. The inspection department der the jurisdiction of this department, while the e department, represented by our various garages ther service installations, is not. But service fol- inspection, and, if that is rigidly maintained and tly performed, the efficiency of the fleet is assured.

The head of the inspection department, working the transportation department, is Richard Law- , a man who has been with the Crescent Creamery or 12 years, and who appears to possess a positive niness when it comes to spotting motor ills and for ribing remedies for them. He is a motor truck ostician par excellence.

But inspection starts with the driver. Every day he turns his truck into the company garage he sign a card which must state whether in his opinion ehicle requires attention for any ills it may have oped. If this attention is for minor repair only it ndled by our emergency service department, but appears to be more serious it comes under the ex- attention of Mr. Lawrence. He has the authority rect the course and extent of the service that the cular unit may require, all the way from minor rs to complete overhaul. Our garages are com- ly equipped to handle any repair job any unit in eet may require and all of our repair work of what- r kind is done by the 30 or 40 mechanics we employ.

The trucks in our entire fleet are each designated distinctive number which indicates its classification capacity. Each unit has its card and every driver he starts out must have a clear card, indicating the vehicle he takes out is in the best of condition he starts out with it.

This rigid inspection not only maintains a high ge of efficiency in the fleet as a whole, but it keeps overhead in the service department and in a major- f instances makes the overhaul a regular seasonal r rather than an emergency matter.

"Another matter which this department has under its control is the maintenance of a clean and neat appearance of the individual units in our fleet. We are purveyors of food products and a neat and sanitary appearance for every delivery unit we use is essential, both for the maintenance of our own reputation and as well for the health of the public. For this purpose we maintain our own auto washing department, our own painting department and our own polishing department. We take a pride as an institution and as individuals in the spick and span appearance of every piece of transportation equipment we employ, and our inspection department pays as meticulous attention to the outward appearance of a motor truck as it does to its mechanical efficiency.

"In other words, ever since the company instituted its transportation department it has demonstrated its value as a very important factor in contributing to the efficiency, economy, appearance and operation of a large and varied fleet of motor and horse drawn vehicles."

NEW MILK DISTRIBUTORS' ASSOCIATION.

Organization of the Spokane Milk Distributors' Association, with more than 26 dairy concerns as members, has been announced. Following are the officers and directors of the association: A. H. Poston, Stadacona Dairy, president; William Robb, Western Dairy Products Co., vice-president; A. A. Wagner, Hillyard Dairy, treasurer, and William C. Sohns, Pine Creek Dairy Co.; Mr. Anderson, Early Dawn Dairy; Mr. Olson, Victor Dairy, and F. B. Flood, Broadview Dairy Company, directors.

Mr. Poston stated the objects of the association are as follows: Improvement in the dairy industry; co-operation with the health office to improve the milk supply so that Spokane may be noted for its good milk as it is noted for its good water; co-operation with the agricultural bureau of the chamber of commerce to put the dairy industry on a more substantial footing; securing figures on costs of producing, processing and distributing dairy products, and to correct abuses in the business, including unethical practices, such as rebating.

AFTERNOON DELIVERIES PROVE SUCCESSFUL FOR COLD MONTHS.

At the Hosler Dairy Co., in Toledo, O., the afternoon delivery of milk and cream to their customers through the colder months of the year is proving out very successfully. A. J. Hosler, the owner, states that this method not only assures the customers fresh morning's milk for their evening dinners, but it prevents freezing of milk, breakage of bottles, loss of product and better results all the way round. This company practices this method successfully during all the colder months of the year and during the warmer months, the milk is delivered in the early morning.

This is a progressive dairy, started four and one-half years ago, and making rapid progress in business in the city of Toledo. A new bottle washing machine has recently been installed in this plant.

ABOUT READY FOR OPERATION.

Elmer Koch, purchasing agent for the Pet Milk Co. of St. Louis, Mo., advises as follows:

"Practically all material, machinery and equipment for the Bowling Green, Mo., plant has been ordered and shipped. We expect to start operation in the near future."

"Lets Get Down to Busines
Selling Milk!"

That's What Mr. Milk Dealer is Tell-ing His Staff Heads in this Day of Highly Developed

Modern Merchandising Methods

THREE successive stages in the development of the milk industry in America stand out as plainly as the ages in the evolution of mankind. The rough-stone age of the milk business was in those days when the problem was quite elemental—producing the milk and delivering it. Then came the smooth-stone age of getting the milk, handling it properly, distributing it properly—and selling it.

Today the milk industry stands at the same point of advancement as the world in general. We are in the highly advanced rotary age. In other words, today is the age of the wheel, symbolizing the cycle of a perfect economic system—that is, perfect as we creatures of human clay know perfection.

The economic scheme in the milk business, a truly fascinating science as the liberal arts of trade go, is one of the most intensely interesting subjects that ever challenged a student's imagination, well worthy of this great nation of magnificent sciences.

Let us compare it for a moment with the American economic scheme, which is defined as the science that investigates the material means of satisfying human desires. That being true, milk economies well may be called the science that investigates the material means of putting before the greatest possible number of people the greatest food in the world.

This brings us to the present stage of development in America's milk economics. We have gone through the problems of production and distribution; we have gone well into the problem of selling milk.

But the problem to day is—selling **more** milk!

Perhaps it were better to say the problem of selling milk has resolved itself into the **opportunity** to sell more milk.

It is surprising at the number of people in the milk business who overlook the salient features of their business. It is surprising at how few milk dealers really are measuring up to their industry's present challenge.

Milk dealers are business men. Call a business meeting of some of your friends to go into an important matter. Five or six will gather around the table with you, exchange a few little preliminary pleasantries and then begin fingering at their watches.

"Let's get down to business," one man will say. And that's the spirit of them all; they want to get through with the little nonessentials—and get down to business! They haven't time to waste. They want to get at once to the heart of their subject. Quite naturally. That's business.

Yet, for some reason, the average milk dealer stays so occupied with the various little operations of his business day in and day out that he steadfastly keeps off the most important subject that he has today—the opportunity to sell more milk. He is neglecting his educational opportunities, or he is not pushing them as eagerly as one would imagine a man would go after a
thing he knows he can get.

There is a take-it-for-granted attitude in the
industry that was fairly well described to us the o
day in conversation with a gentleman who has had
siderable experience in handling the sales problem
some of the largest milk concerns in the country.

"The average milk dealer," this gentleman said,
spent so many years with milk that he forgets that o
human beings don't know what he knows. The a
age milk dealer is well informed as to his product
other class of American business men will compare
him in knowledge of his goods. But he is doing
tremely little toward letting others know what he kn
and he seems to think it strange that somebody
should feel qualified to help him sell his milk. E
busy with the mechanics of his business all the t
and he knows the mechanics of his plant, the rou
the scientific control, the mechanical operations,
but he positively balks at the suggestion that he sh
go further into the mechanics of merchandising, t
one of the most scientifically involved propositions
we have today."

We listened and did considerable thinking on
subject.

"But," protested a milk dealer to whom we
with this statement, "why should one expect **me** to
interested in some high-pressure plan to sell **my** m
What can I say that others can't say? We have
so far in this industry today that there is little one
can say that another can't. I sell good milk—so d
competitors. All of them have milk just as goo
mine. I haven't any brand, no particular license.
welfare workers, the health officials, the govern
agents—all these people have spread the gospel of
until there is little more we can say."

For some reason we felt that this dealer furni
ample evidence of what the milk merchandiser had
complained of—a self-satisfied sort of spirit of we-h
done-all-we-can.

It so happened that on that same day while we
dining with a friend comment was passed upon ou
dering milk.

"You drink milk regularly?" the friend asked.

"Yes."

He was silent a moment as though in thought a
something.

"Ever suffer from constipation?"

"Why, no—why?"

"That's funny," he declared, "as everybody k
milk will cause a man constipation if he drinks it
enough."

This wasn't an ignorant man; he was a bright
ness man, one of the leaders in his community.
what were milk dealers doing while that man was f
ing his silly notion about milk?

Just a few mornings later a neighbor happene ılong just as we were gathering the morning paper he usual two quarts of milk from the front porch.)on't you know better than to drink that stuff?'' eighbor asked.

What's the matter with it?'' we asked in surprise. 't you drink milk?''

Not that kind,'' the other man snorted. ''I used nk it, back home, when I knew where it came from. don't drink this stuff they put up in cities now- . Why, do you know, they put starch in that bot- nilk to disguise its appearance, because it is so old it is delievered that no one would want it if they t doctor it. Say, you ought to let me take you home and get some real milk. I never will forget Mrs. Jorgenson used to pass it over the fence— ɔle gallon bucketful at a time. Yummm, that was I knew where it came from.''

'e do, too, and that's the reason we don't want any But what were the milk dealers doing all the this man was forming his foolish ideas about mod- nilk plants? No welfare worker ever will reach nan; he is a person of affluence, the head of a big ess, a prominent spirit in his church and a man questioned in community matters.

ıere's only one thing that ever will reach that man, hat's a sales campaign that will go direct to him. ıst be a carefully laid out sales campaign that will TNT and dynamite in both arms, for it will re- a terrific mental upheaval before he will ever budge those convictions formed after the meaningless ɔn we human beings have of deciding a thing is g because we don't understand it.

ıere is an unfortunate psychology about closed . They breed suspicion. It is a good thing that dealers are going in more and more for glass par- s and sunlit plants. But even so there are limita- to what we can do to throw open the plant to the c's eye. Then, let's do the next best things—let's the plant to the public. Let's take counsel with ıandising genius and take the true story of this food to the homes of rich and poor, learned and rned. Such a campaign should be ably and intel- :ly directed by expert advice.

ıese cases we have just mentioned are extremes, of e, but there are people of this kind in the world— more than we dream. And there are still many, more who are not opposed to milk but yet don't t or don't buy as much as they should. All of us that the great majority of human beings still feel nilk is more or less too expensive.

efore we call ourselves really worthy of this great age of milk economics, let's get down to the ap- science of merchandising and study out this great tunity before us today.

other words, let's get down to business—**and sell milk!**

milk men would only get out a little more and de- a closer contact with the people who buy—or d buy—the product, they would discover surpris- vidence of a lack of information about milk that never before dreamed existed. They would realize reat necessity for sales effort today.

ersonally we feel sure that public ignorance is a r that can be overcome without great effort. We ather patient with public opinion after many years ıtact with it in various forms. We know that grown ɔn the whole want to be fair, and when the facts ut before them they will be interested.

ıt every time we think of certain grown people and of their queer ideas about milk, we can feel more nt and chuckle more freely regarding that little girl of a certain popular joke, the little girl who turned great wondering eyes up to her monther and said:

''Mumsy, I surely will be glad when we go back to the country so I can get some of that milk that comes from cows.''

Some grown people don't know much more about milk.

IN GOOD HANDS.

The Columbus, Ohio, convention of the International Association of Milk Dealers next October is in good hands. The program will be arranged by the following committees:

Controllers' Council.

H. H. Neel, D. H. Ewing's Sons	President
John M. Gullans, Bowman Dairy Co	Secretary
H. R. Hamilton, Telling-Belle Vernon Co.,	Chn. Program Com.

Laboratory Section.

Geo. B. Taylor, Chestnut Farms Dairy	Chairman
R. C. Fisher, French Bros.-Bauer Co	Secretary

Plant Management Section.

Tilford A. Ewing, D. H. Ewing's Sons	Chairman
A. J. Dreux, Rieck-McJunkin Dairy Co	Secretary

Production Section.

H. D. Davis, Supplee-Wills-Jones Milk Co	Chairman
Walter D. Hunnicutt, French Bros.-Bauer Co	Secretary

Sales and Advertising Section.

F. A. Webb, Borden's Farm Products Co	Chairman
Milton Hult, Superior Dairy Company	Vice-Chairman
W. J. Burnap, Rieck-McJunkin Dairy Co	Counsellor
L. H. Heller, Northland Milk & Ice Cream Co	Counsellor
K. L. Carver, Crescent Creamery Co	Counsellor

Twentieth Anniversary.

The 1927 convention will be the twentieth anniversary of the association and obviously a program must be arranged to be worthy of the occasion.

KEEP UP THE GOOD WORK, PAINTSVILLE.

A new plan is being carried out by the Parent-Teachers' Association of Paintsville, Ky., by which the lower first grades of the public schools will be served with milk. It is hoped to later extend this plan so that all the children of the lower grades will profit by it. One hundred twenty half pint bottles of pasteurized milk will be brought in each day for the students. This will not interfere with a child's appetite for noon dinner, but will be better than the candy generally consumed at recess time. It is felt by everyone concerned that the students will show appreciable development with this extra allotment of ''the perfect food,'' make swifter progress in their school work and show physically in brighter eyes, stronger bodies, and more alertness the good results of mid-morning nourishment of milk.

THE NATIONAL PLAYGROUND ASSOCIATION.

What is advertised as a ''Consummation Banquet'' is to be held at the Edgewater Beach Hotel, Chicago. Thursday evening, April 21, by the National Playground Association. The big affair will start at 6:30 P. M. and big things are promised in the way of special dishes and entertainment. The office of the association is at 64 West Randolph St., Chicago.

Milk Over the Soda Fountain

Sales Show Considerable Increase as Result of Pushing. How a Connecticut Milk Dealer Helped His Dealers to Build up Sales

By HENRY FROMMES

IN ADDITION to the increasing sales of market milk over the soda fountains of the country there are other reasons why the dealer should further cultivate this outlet. There is some good advertising in it if the dealer is able to get his wall and counter cards in enough of these places and to get the retailer to push the goods.

The demand for milk by the glass over the soda fountain counter always has been considerable but within the past two or three years milk and buttermilk dispensed by the glass have succeeded in crowding out many of the fancy ice cream combination drinks which were so popular a short time ago.

A really surprising volume of sales in fresh milk are being made over the counter in the larger cities of the Middle West and the East. The soda salesman manager of one of the largest drug store chains in the country recently told the writer that their fresh milk sales were running as high as 3,600 gallons daily with a jump to as high as 4,500 in the early summer.

"We have consistently pushed milk over our 500 soda fountains," said this manager, "largely because we make a good margin on its sale, also because it is easy to handle and what is more important yet, the demand is dependable. Milk drinkers with the habit drop in at our fountains regularly because they know that our milk is always fresh and of high test. We hope to increase our milk sales by 1,000 gallons this summer."

As a matter of fact, the large chain drug stores and confectioneries sell more market milk per unit than do the independent drug stores, perhaps for the reason that the chain stores are more progressive in their merchandising methods, study the public taste more carefully and abide by the results of these studies. The average independent druggist hasn't yet seen the established demand for fresh milk by the glass though you can get it in nine drug stores out of ten at present.

Dealers Must Cultivate Market.

In the smaller towns and cities it is largely up to the milk dealer to cultivate this over-the-counter market and after all, it hasn't proved to be a very difficult one to cultivate.

Last summer a New Haven, Conn., milk dealer with wide distribution found he was selling as high as 11 gallons a day of fresh, high test milk to the leading soda fountain. He checked up on this outlet and came to the conclusion that the retailer had built up his daily milk business by cultivating it—by serving a light luncheonette for 35 cents in three combinations, each of which gave the customer the option of a glass of fresh milk. This was what developed his milk sales and as he made more profit on the milk than on coffee or cocoa, he was perfectly satisfied to push it as a feature of his luncheonette.

With this information, the milk dealer had a salesman visit other large fountains in the city, giving them the facts and suggesting that they, too, offer the public something of the kind. Several of them did it. The effect was that the sale of milk over the fountain counter in this city alone probably runs higher than any one of its size in the whole country.

The small, outlying drug store fountain and co tioner isn't the best prospect for fresh milk sales- downtown store with a heavy noon hour business is worth while at least in the early stages of the dev ment of this market.

In order to capture this business and secure active selling co-operation of the worth-while dispe discounts have to be good enough to enlist his int and active co-operation.

Providing the milk dealer can get his trade nam other insignia in the store, he can probably get an a return on the resultant advertising.

Need for a Practical Dispenser.

It has been demonstrated in the beverage bus that a visible dispenser of the inviting kind will cold beverages ten times faster than bottle display w may account for so many of the nationally adver beverages being openly displayed in season in sp dispensers. Many of these dispensers which have re eration facilities, will serve for fresh milk though s thing might be gained by having the milk in the tainer visible to the eye of the customer.

There are plenty of good dispensers on the ma for fresh milk but they are largely for cafeteria o taurant utility and do not expose the milk to the e the customer. Hence, something in the glass or escent line is needed.

Such a dispenser, even though supplied by the dealer with a binder as to retailer's bulk purch would be worth the price if the dispenser is consid in the light of a generally valuable advertisemen the milk plant or its trade name.

As it is now, small fountains are dipping milk the cans in a more or less unsanitary fashion v doesn't tend to interest the consumer looking on. course, the better fountains are utilizing their s containers for fresh milk but these have the disa tage that they do not hold enough and make for i venience, especially when milk sales are brisk.

Though familiar with the milk merchandising o country, I have not yet seen a milk dealer with any attractive to offer the retailer in the way of advert milk dispensers which is somewhat surprising.

Fountain operators at present are much conce over their overhead costs. Labor is high, rents are and there is a slender margin of profit in fancy dr due to numerous other causes, so that beverages su fresh milk which are simple to serve and which ha established demand appeal very strongly at the pr time.

What Kind of a Dispenser?

To properly display fresh milk to the patrons of fountains, the dispenser should hold not less than gallons, should be well made and attractive, with a a portion of glass as a means of tempting the eye the freshness of the milk within. It should carr name or trademark of the dealer supplying it and should be with it some dealer help material design sell it over the counter. Such a dispenser would to be so constructed that daily sterilization is po

DE LAVAL

New Series De Laval skims to 1/4 of 1/100 of 1%

MR. AUGUST F. SCHROEDER of Algoma, Wis., obtained a No. 70 New Series De Laval Separator through his purchase of the cheese factory formerly operated by Mr. A. P. Stengel of the same place. He writes:

"The De Laval has made a wonderful showing. We have tested it in every conceivable way and it has made the record of skimming to the degree of perfection of ¼ of 1/100 of 1%."

The above letter should put an end to the doubts any cheesemaker may have as to the ability of the New Series De Laval to recover enough additional fat from whey to pay for itself in a reasonable time.

Judging from the letters so far received from cheesemakers, the skimming efficiency of these new machines is improved to an even greater extent with regard to whey than in the case of milk.

However, with either milk or whey at a normal separating temperature, at full rated capacity and with all other conditions equal, the New Series De Laval skims cleaner than any other separator ever built.

DE LAVAL

When writing to THE DE LAVAL SEPARATOR COMPANY please mention *The Milk Dealer.*

and so that the dispenser can draw it quickly and without waste.

Milk, after all, is one of those foods that sell on the appeal of the eye—it looks good when it is good and persons who never would think of ordering a glass of milk over the soda counter on a hot day need only to have the suggestion made to them in some such fashion as that described above.

As a matter of fact, one of the leading chain store groups have done some experimental work along the line of getting fresh milk and syrup combinations which would find ready buyers over the counter. Even milk and gingerale have been experimentad with though we have not yet any definite results of the tests.

Undoubtedly, there are combinations at the fountain with fresh milk as a base and perhaps if enterprising milk plant can devise a new combina there would be a big market waiting for it.

Milk goes fairly well with carbonated beverag certain kinds. It is at present the base for half th cream sodas made and sold in this country which form of milk consumption over and above that sold and alone, by the glass.

In this connection, the two methods of selling through soda dispensers present great opportu for the milk wholesaler and it behooves him t about to broaden that market now that summer i far off.

How to Make Italian Cheese

One Way to Utilize Surplus Skim Milk. A Plant Superintendent Predicts that Eventually Every Drop of Skim Milk Will be Utilized

By H. W. VETTERLEIN*

THE season will soon be here when many plants will be at a loss to know what to do with all the surplus skim milk. New York City, and some others with a large Italian population, offer a good market for well made cheese.

Some special equipment is needed, such as a 350-gallon cheese vat, a steam ejector, a 350-gallon jacketed copper kettle, with the steam pipe extending into the water jacket. A single kettle, without jacket, can be used, but the coil of steam pipes must extend into the cheese and are hard to keep clean because the cheese burns to the pipes. So it pays to get the jacketed kettle. A draining table, made very cheaply from one-inch boards, is necessary. This table is to hold the perforated tin molds, which are filled with the pot cheese.

Wooden shipping cases with a hinged cover are used. They are made large enough to hold twelve of the filled molds. Six on the bottom, separated from the top six by a piece of zinc.

I will outline the way one successful company makes the cheese. They employ an experienced Italian cheese-maker, who is not afraid of long hours, or hard work. The milk is separated at 90 degrees F. and piped to the ordinary 350-gallon cheese vat. Skim should be perfectly sweet. Run in 300 gallons of skim. Dilute four ounces of good rennet in one quart of water. Mix thoroughly into this 300 gallons of skim, but be sure it is 90 degrees F. In about 30 minutes it will be coagulated, but watch carefully so that it is firm enough, but still not wheyed off. Cut into one-half inch cubes and stir thoroughly with a rake until curd settles on the bottom of the vat. Then insert the ejector hose and pump the whey to the copper kettle.

To this whey add five pounds cheese salt, 12 quarts 40 per cent sweet cream, 50 gallons skim and 15 gallons starter. This starter is made from sour cottage cheese whey, to which is added two gallons good vinegar to 50 gallons whey. It should be made a few days before you start making cheese, and then can be carried along just like any starter, adding whey and vinegar as needed.

The best way is to heat the whey in the kettle to 140 degrees, and add the 50 gallons skim, and at 160 degrees add the 12 quarts 40 per cent cream and five pounds cheese salt, and continue heating to 190 degrees. The cheese will now come to the top, and must be dipped off with a perforated special cheese dipper and put into the perforated molds, which will hold five pounds of fin cheese. Keep at 190 degrees and dip off the cheese it stops coming to the top. Then drain off whey an the remainder from the bottom of the kettle. When the molds of cheese are covered with parchment and allowed to drain over night. In the morning are packed into the shipping boxes and sent on the train to New York City. This cheese should be cold, because it spoils easily. The curd that is left i cheese vat, after the whey is pumped out, is pile and when firm is cut into pieces with a cheese The pieces are about 10 by 12 inches, six inches thick is called Italian slab cheese. It is ground up f mixed with cream, and molded into pear shaped weighing one pound each. These are hung up allowed to dry before being sold. To make a riche cheese two per cent milk is used. This must be h to 96 degrees before adding rennet. To make full curd slab cheese, use whole milk and heat to 100 de before adding rennet.

The starter is kept in two ordinary 50-gallon barrels, with a good cover.

I believe the best way to handle this cheese is to arrangements with some reputable Italian firm, them furnish the kettle, etc., and just sell them the and cream, and furnish steam, and transportation t railroad.

There are many ifs and buts to this business, can be worked out with profit. The time is coming every drop of skim milk will be utilized.

SOME GOOD SLOGANS.

In Sandusky, O., they are firm believers in slogans for their dairy products and two exceptio good ones were recently noted and recorded.

The Wesley L. Till butter plant in that city be in educating the populace that their brand of but "Gol Durn Good Butter." Perhaps not all people that language, but everyone understands it and a of the Till product cannot help but convince the sumer to agree with the slang phrase that it is Durn Good Butter."

The Esmond Dairy Company has selected a clever slogan and Sandusky residents are constant minded everywhere that the Esmond milk is "A Re tion in Pasteurization."

WALSH MILK WAGON HARNESS

A Great Advance in Harness Making

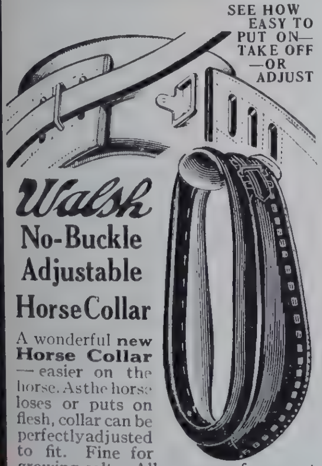
Walsh Milk Wagon Harness

A new kind of a harness that cuts out repair bills, greatly improves the looks of your horses, is much easier and quicker for drivers to hitch and unhitch and costs less than ordinary harness.

The Walsh No-Buckle Harness has proven an amazing success among farmers of America. Now milk dealers are taking advantage of this greatest of all harness improvements.

Good Looking and Fits Perfectly

A Collar as good as the Harness



SEE HOW EASY TO PUT ON—TAKE OFF —OR ADJUST
Walsh No-Buckle Adjustable Horse Collar

A wonderful new **Horse Collar** — easier on the horse. As the horse loses or puts on flesh, collar can be perfectly adjusted to fit. Fine for growing colts. Allows room for sweat pad. Read all about this amazing new collar in my big free Harness Book.

Walsh Harness can be adjusted to fit any horse perfectly. Made of the best harness leather ever tanned. It is exceptionally well made, perfectly sewed and finished. Large production enables us to make such a high grade harness at the price of ordinary harness.

Lowest Repair Costs Ever Known

With no buckles to cut straps, no rings to wear straps in two, and no holes to weaken the straps, Walsh Milk Wagon Harness is not only three times stronger than any other harness, but cuts repair costs as low as ten cents a year.

Many farmers, who are hard on harness, have used the Walsh as long as ten years without a penny for repairs.

It will pay you to investigate and post yourself on this new way of making harness. Write at once for free book.

NOT A DROP OF DAIRY DRINK IN THE BOX!
THE CHILDREN DRANK IT ALL TODAY. I'LL HAVE TO ORDER AN EXTRA BOTTLE OR TWO FOR YOU!

Leave More Milk
At Every House—Every Day

One taste—and children are "sold" on milk, when it's mixed with Chocolated Dairy Drink Syrup. That's hard on dad, for he likes it too. The mellow chocolate flavor wins them all—even those that formerly had to be coaxed to drink milk.

Chocolated Dairy Drink Syrup is so good and so pure that physicians endorse it. It offers milk dealers a big, new opportunity for additional business. You can sell it mixed, or in the big, handy glass jar for general household use—a wonderful value for 35c.

Try a sample and note its rich, satisfying flavor.

Sent free—on request, with copy of our "Milk-Cap Folder," one of the best dealer helps ever devised.

The Principle As Developed by Howell Engineers

(Patents Pending)

The outer race or cup of The Timken Tapered Roller Bearing is fitted into the housing of the motor end bell with a sucking fit which allows creeping of the outer race. The bearing is shimmed with a compression spring which is held tight against the outer cup of the bearing by a grease cap. The action of the spring pushes the cup tightly against the rollers thereby keeping the bearings snug at all times—automatically taking up wear and eliminating noise, and removing practically all chances of bearing trouble.

Timken Roller Bearings *plus*—an Automatic take-up!

The Howell method of roller bearing application (illustrated above) is the last word in electric motor construction. It practically eliminates all bearing trouble (and 95% of all electric motor trouble can be traced to bearing failure). It insures a continuous uniform air gap in which any looseness in the bearing caused by wear or otherwise is instantly and automatically taken up. It keeps the rotor centered at all times and allows for any lateral expansion of the shaft which might occur due to heat.

Howell Red Band Motors have always been known for their ability to master hard jobs—equipped with Timken Bearings they are even more dependable, more staunch than ever.

Howell Red Band Motors with Timken tapered roller bearings are offered in all sizes and types in addition to the regular motors with re-centering sleeve bearings. Get in touch with the Howell representative in your locality or write direct to the factory for complete information.

IDEAL BOTTLES FOR MILK AND CREA

Water

A Blessing and a Curse to Your Business

A Blessing in view of its use to flush and clean machinery, floors, etc. In view of its conversion into steam to heat with, to pasteurize with, to obtain power from. In view of the fact that it represents 87% of milk by volume.

A Curse in view of its presence in the form of condensation on the walls, ceilings, floors, machinery, pipes, belting, etc., with the resultant unnatural depreciation of these things.

In view of its effect on the health of your workmen when they are exposed to a high relative humidity, wet floors, dripping ceilings and cold drafts.

In view of its effect on the quality of your product when it causes mold due to a water saturated condition of the air.

This Curse Can Be Removed From Your Business

Removing the excessive moisture from the air of your plant will effect a tremendous saving in depreciation of building, machinery, pipes and belting. It means more efficiency from your workmen as well as a more healthy working condition. It will help you produce a higher quality product because of improved sanitary conditions.

Knowledge of the types of machinery and equipment used in your plant together with a thorough knowledge of the "handling of air" in milk plants and creameries by the King Ventilating Company's engineers puts us in position to render you a most valuable service.

Big Texas Dairy Discovers Way to Increase Milk Sales

THE Tennessee Dairies, Inc., Dallas, Texas, saw many dairies throughout the country increasing milk sales by tying-up to Thatcher Bottle slogan "A Bottle of Milk Is A Bottle of Health." Anxious to increase profits, this well known dairy decided to try out the idea, with the following result:

> *"Thatcher Advertising in The Saturday Evening Post and other magazines has borne fruit in Dallas. There is great interest here in milk as a health builder and more people than ever are drinking milk. We believed we could reap a good harvest by tying-up to Thatcher advertising by using Thatcher Posters. We were right—in one year sales increased 10%."*

From Texas to Wisconsin, from Maine to California, dairymen testify to increased sales through this simple and easy method. If you are not identified with this big and popular movement, write us today.

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher Bottles that Superior Quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown on every Thatcher Bottle for your protection and guarantee.

Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

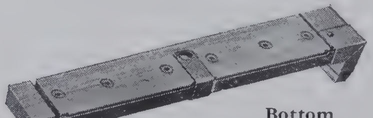
BOTTOM RUNNERS on your BOTTLE CRATES

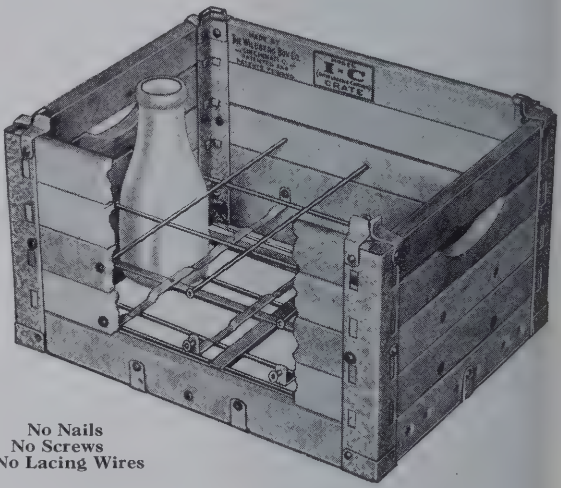
The Bottom Runners on

The MODEL **I-C** (Interlocking Corner) **CRATE** are the only runners on the market which provide the crate with a perfectly smooth surface [with nothing to catch on conveyors or floors], yet at the same time take nothing away from the strength of the bottom slat.

To apply all other runners the manufacturers either wood-work away part of the thickness of the lumber of the bottom slat and weaken it to the point of splitting at the first hard blow it receives, or have numerous rivets, holes for which are bored against the grain of the wood, also greatly increasing the likelihood of splitting and breaking off.



Bottom
End Runner



No Nails
No Screws
No Lacing Wires

Ours is the only Bottom Runner to *actually strengthen the bottom slat,* due to the *Patented Clips that reinforce bottom, inside and outside* of the slat above the bottom row of wires on the ends and above the brace wires on the sides.

And—if you use hand trucks in your plant, you will find that the nose of your truck will slide under the I-C bottom runner at any angle at which it strikes the crate. It won't with most others.

Ventilating the Milk Bottling Plant

Heat and Ventilation Problems Should be Considered as One. Old Notion that a Dairy Plant Must be Wet is Exploded by One Who Knows

I WOULD like to call your attention to a picture I saw recently in a dairy magazine. It is a picture of a new milk plant, just completed and ready to start operating.

It was built with an idea of modernism and permanency. It has evidently been equipped with the finest machinery available for use in a milk plant.

Looking at the building from the outside, one cannot help but get the idea of permanency from the brick and limestone exterior. You can imagine the bright, sunny interior as you note the abundance of windows.

Going inside, one would find the walls and ceilings finished in white. Possibly tile extends from the floor line to the bottom of the windows. The machinery and equipment literally glow with cleanliness, "sanitation" impresses itself on your mind as your gaze takes in the enamel and nickel plated vats, coils, fillers, washers, etc.

All this is as it should be, in view of the nature of the product to be handled. Milk must be kept clean, fresh and free from disease-carrying germs.

This plant has been built, not only to conform with laws requiring certain sanitary conditions and equipped for profitable handling of the product, but with a view toward displaying to the public the cleanliness with which the product is dealt with.

Let us return to this plant the day the wheels start to turn and operations are begun.

Practically everything that goes on in the plant entails the use of water.

The product itself is 87 per cent water. We find open sinks full of water. Churns and other equipment, as well as floors, must be flushed and cleaned with water. Milk may be pasteurized in vats causing clouds of steam to fill the air, bottles and cans must be washed, adding more water to the already overloaded air.

How It Happened

One day not long ago a modest young man, who is recognized as a heating and ventilating authority, dropped in on us for a chat. We like to listen to a man who knows his business.

We got to talking about heating and ventilating milk bottling plants and we asked him to write us a story on the subject.

The accompanying article is the result. He doesn't want us to use his name, that's just how modest he is, but we are going to add that his firm is well known in the ventilating field.

Water is both a blessing and a curse to the plant.

It is a blessing in view of its many uses in operating a milk plant.

It is a curse, in view of its effect on building, equipment, machinery and the health of the employees when appearing in the form of condensation on walls, ceilings, pipes, belting, etc., and when causing too high a relative humidity condition of air.

Now let us return to this same plant a few years later.

We find machinery rusted, equipment in bad condition, "corrosion" has set in. Ceilings and walls covered with condensation, causing the paint to peel off. A feeling of heaviness pervades the air, possibly we are chilled if the temperature is below normal.

Without question, attempts have been made to maintain the beautiful sanitary condition that existed when the plant was first opened, but these efforts were along the lines of covering up and repairing rather than of eliminating the cause of the damage.

If we were to go to the owner of the plant and say, "When you built this plant considerable emphasi put on sanitation, cleanliness and beauty. Tod your plant there is every evidence of decay, cond tion and mold. I should think you would do some about it."

His reply would probably be typical of those we right along that this is a condition he must get with in his business, that it is a necessary evil, i always been this way in the milk business and that ing can be done about it. Of course, he tries to things as clean and bright as possible, but it's a l fight and at best requires frequent replacement o chinery and equipment, of painting and refinishing

Let us analyze Mr. Owner's problem for him.

To begin with, if conditions were to remain as were in the plant before starting operations, the l ing and equipment would be subject to only "nat depreciation of "aging."

The equipment and mach must be used, of course, to ate, and if "air conditions" remain the same during oper as before the machinery then be subject only to the na depreciation caused by usag differing as material and manship differ. The bu would still remain as befor

However, we are dealing an unnatural and as we ho prove an unnecessary deprec caused by a faulty "air tion" over which the ma turer of building materials chinery and equipment has n trol.

We can easily establish fact, that the causes of this f air condition can be succes dealt with, by methods prov repeated application.

Let us assume that operations are begun in the during the summer and at the time the temperatu the work rooms is 70 degrees, the temperature o being as high or higher.

The relative humidity of the air we will place per cent before starting operations.

To begin with, the air passing over open sinks, up a certain amount of water and the relative hum gradually rises, steam emitted from pasteurizing adds considerable more and the R. H. rises more ra additional steam from bottle and can washing mac and water absorbed from the flushing of floors an chines, soon fills the air with all the moisture it is ble of holding at the temperature prevailing an have a relative humidity of 100 per cent or com saturation.

Steam emitted into the air being at a higher perature than the air or surrounding surfaces conc and settles on convenient contact spots.

Classifying the causes of high relative humidit resultant condensation, we arrive at the three sour be dealt with.

First, open receptacles holding water, wet su *here interiors are painted with this*

Barreled
Sunlight
Reg. U. S. Pat. Off.

Washing removes the dirt but not the paint—

TRY to wash ordinary white paint. Does the dirt come off? Does the paint stay on?

You can wash Barreled Sunlight clean any number of times without the least injury to its lustrous white surface.

This is because Barreled Sunlight is so satin-smooth that dirt can find no foothold—and so durable that repeated washings will not wear it away.

Made by the exclusive Rice Process, Barreled Sunlight is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions—also, not to flake or scale if properly applied. It is economical in application, too, flowing on freely with brush or spray at the *lowest cost per square foot of surface covered.*

These are the practical reasons why thousands of industrial plants prefer Barreled Sunlight to any other paint for their ceilings and walls.

Sold in 55- and 30-gallon churn-equipped steel drums, and in cans from ½ pint to 5 gallons. Where more than one coat is required, use Barreled Sunlight Undercoat first.

The coupon will bring you an illustrated booklet and a painted sample of Barreled Sunlight.

of floors and equipment caused by flushing with water. This is usually a permanent condition, especially in the former case and affects the relative humidity of the air 24 hours a day.

Second, pasteurizing vats emitting steam which rises naturally to the ceiling, owing to its lighter weight due to higher temperature. This condition exists only part of the working day.

Third, bottle washing and can washing machines throwing off large volumes of steam under pressure. This condition varies according to the type of machine being used, some equipment being designed to eliminate the escape of steam from the machine when in use.

The effects of all three of these causes may be multiplied many times by insufficient heat, or heat which is not advantageously applied. Another fertile cause of difficulty is the too frequent or continuous opening of doors and windows.

In considering ways and means of relieving the air of the excessive moisture being thrown off continually, it is necessary that we consider each of the three foregoing causes separately for reasons that will be obvious.

It is clearly understood by all that a pool of foul, stagnant water could hardly be purified by merely mixing it with a stick, but would soon be cleaned out if strong currents of fresh water were run rapidly through it.

Thus also is it necessary in the relieving of an excessive moisture condition of air to have pure fresh air from outside replace the moisture laden air inside.

It should be obvious to all that the quantity or rate of air change provided should be no more and no less than that which is economically necessary and conducive to healthy working conditions.

The problem of arriving at the most desirable standard of air circulation, as well as arriving at the most efficient apparatus to use in obtaining it, should be left to experienced engineers who have specialized in the study of all the phases of milk plant and creamery buildings, machinery, equipment, and the business itself. In addition they should have a proven knowledge of the handling of moisture laden air ventilation.

Returning to the three classes of moisture laden air problems, let us consider ways and means of dealing with them.

In the first case, we have the permanent condition of open sinks, flushed equipment and floors. The amount of moisture absorbed into the air from this source is relatively small and therefore requires a relatively slow air change to maintain the proper relative humidity. However, this condition is a general one requiring that all the air of the room be moved. During the summer this air change can be accomplished with reasonably good results by the opening of doors and windows. In cold weather, however, this method is impracticable, costly and dangerous.

The inadvisability of using window ventilation in cold weather need not be dwelt upon as loss of heat, lack of air control and danger of drafts is clearly evident.

To properly handle the excessive moisture condition, brought about by the exposed water surfaces in the winter, it has been found to be most economical and most practical to harness natural forces. A natural draft siphon ventilating system properly proportioned and distributed as to units, designed to change the air of the room completely and at the rate of change necessary to the conditions, can be obtained at reasonable first cost and will eliminate the operating cost of mechanical apparatus.

This natural draft system should be considered the basic unit of a complete installation, as its work is continuous and permanent while the balance of ventilating
apparatus necessary, serves only as an auxiliary
used as occasion demands.

The natural draft units should be designed to
all of the air of the room, from points near the floor
to conserve heat and remove air with the greatest
centage of moisture, admitting fresh air near the
ing with ducts designed to avoid drafts and to pr
the warm air being siphoned out.

Very successful installations of this nature have
made by engineers specializing in this work. By re
ing the foul, damp air near the floor level with as
outtakes as will draw the air from a given radius
by placing small intakes at frequent intervals abou
room, both units equipped to prevent backdrafting
properly designed natural draft system will hav
minimum effect on the room temperature when pr
ly operated.

The next source of moisture to be dealt with i
pasteurizing vat or similar receptable from which s
rising in slow clouds soon saturates the air beyon
moisture-carrying capacity. In dealing with this, as
as all problems of removing impurities from the a
should be borne in mind that the most direct me
possible should be used. This is true because it a
for a concentration of the impurities in a small
and has a considerable bearing on the retention of
in the room. In our first problem of moisture rem
we need to deal with the air of the room general
the source of moisture in this case cannot be loca
In considering the class of problem under which w
pasteurizing vats and similar equipment, we find
source of moisture localized to the piece of equip
itself. It would probably be more satisfactory to
the moisture emitted by direct connection of ventil
apparatus to the vat if this were practical. This
the case, however, as anyone familiar with the past
ing vat knows. Therefore, in view of the fact that
leaving this equipment rises directly to the ceilin
cause of its higher temperature than the air of the
it has been found most practical to locate suction
at convenient spots in the ceiling over the main stea
points. The steam drawn through these suction
should be carried out of the building by ducts le
to the roof and exhausting through a stationary
siphon ventilator. Mention is made of the type of
tilator head advisable in view of the fact that war
carrying quantities of moisture, coming in contact
outside air of low temperature, will cause conden
and often ice formation that seriously affects th
sults obtained from a revolving type ventilator he

Returning to the mechanical apparatus necessa
the removal of steam from pasteurizing vats, etc.
riving at the size and number of suction fans nece
their displacement capacity and location, two f
must be considered. First, the size, number, typ
method of operation of equipment emitting the
Second, the volume of air in the room where this
ment is located.

It has been found most practical and highly ec
ical to leave the solution of all this to experts tr
in the handling of moisture laden air, men who sp
ize in the ventilation of milk plants and creamerie

Owners who have turned these problems over in
entirety to engineers who have made a specialty
work have found they accomplished the desired r
at much less expense than those who attempted to
their problems themselves or had others, not quali
do it, handle the job for them.

We now come to the third and last class of ve
ing problems presenting itself in the average milk
and creamery. In this class we will list can wa
machines, bottle washing machines and similar

ment from which steam is emitted in large volumes and under pressure. Machines of this kind that are designed to prevent steam from getting out cannot be considered in this class but to some extent should be considered as affecting the problem we listed under the first class.

In the case of machines not provided with apparatus to prevent steam leaving the machine, we are confronted with the necessity of forcing the machine to swallow its moisture in order to prevent the air in the room from becoming saturated. Because of this it is necessary to get as directly to the points of origin of steam as possible. This can usually be accomplished by connecting an exhaust flue either directly to the machine itself or by constructing a hood cover over the machine with an exhaust flue leading to it. A pressure exhauster must then be provided to draw the air directly through the machine and exhaust flue and then out through the roof of the building.

The designing and application of this apparatus should also be left to men experienced in the difficulties to be overcome when dealing with various types and sizes of machines as well as the conditions affecting the movement of air through the machine.

In viewing the three classes of ventilating problems just discussed we come to the following conclusions.

The natural draft ventilating system, because of its never-ending task, should be considered the main part of the installation, mechanical draft units required by the other two classes of moisture production being auxiliary. For reasons of economy and space saving all three units of the ventilating system should be correlated in so far as is possible.

A great number of milk plants and creameries throughout the country have successfully solved their moisture problems by installations of complete ventilating systems such as has been described in this article. They have turned the responsibility of providing the proper standard of air circulation over to competent engineers.

However, there are still a great number of plants in operation that have either overlooked the importance of this matter or have imposed the problem on individuals not equipped with the requisite experience and knowledge. In both of these cases the depreciation and repair losses alone have far exceeded what would have been the cost of a complete installation made by specialists in this work who would have assumed all responsibility for delivering the proper standard of air circulation.

In quite a few cases of new buildngs, the owner has left the planning and specifying of the ventilation to the architect designing the plant. Even though the architect was one specializing in this particular kind of building, it is an imposition on the part of the owner to hold him responsible for the delivery of the proper air circulation. It is recognized that the task of handling even the simpler ventilation problems is one requiring specialized knowledge. In the case of the milk plant and creamery, we have anything but a simple problem. Granting that the architect designing the plant had the specialized knowledge and experience necessary to lay out the ventilation we are faced with the fact that he does not manufacture and install the necessary apparatus and in the event of the latter being insufficient he could not and should not be held responsible. Then ensues the familiar condition of "buck passing" inevitably ending with the owner "holding the bag" and doubting whether anyone knows anything about this "ventilating proposition."

If the problem of studying the building, equipment, arrangement, etc., the analysis of every factor affecting the condition of the air and the movement of the air, had been turned over to recognized authorities spec ing in milk plants and creameries, who in turn desig manufactured and guaranteed a ventilating syste the building, then money would have been saved, d ciation and repair costs considerably lowered an air condition conducive to healthy, satisfied work have been accomplished.

Without any question the most satisfactory sol to the problem of securing the proper "air condit in a new milk plant or creamery has been obtaine the following procedure.

The owner or architect, or both, selected a repres tive firm of moisture laden air ventilating engin who were charged with designing and supplying complete installation. The architect then submitt preliminary set of blue prints of the proposed buil to the latter who in turn drew in all details of the tilating system. The architect then specified that contractors bidding must purchase and install the plete equipment from the firm of engineers and m facturers whose services were called for.

This has resulted in a most pleasing installation from a standpoint of appearance and of results. A s of the total cost to the owner of the ventilating sy installed in such a case as this, as compared to where makeshift systems designed by inexperie people were accepted would soon convince the most s tical of the wisdom of such a course.

In the case of the plant that is already built, with an unsatisfactory air condition, either from a st point of the building as a whole or in some partic room, the following action would be well advised.

The owner should call upon the services of moi laden air ventilating engineers and have a trained cialist study the existing problems. After a thor survey of things influencing the condition and move of the air, together with a plan of the building sho locations of machinery and equipment, a proposa the furnishing of a ventilating system will be off The system itself can then be installed in the buil by either a local contractor or the manufacturers t selves.

In arriving at the proper "amount" of heat in t milk plant and creamery, we, of course, have the factors to be dealt with as in any other building, br mean average minimum temperature, size of space, and window exposure, building construction, air cha intermittent heating, heat absorbed by evaporation

However, this article will deal with types of hea units, their limitations and relation to ventilating in milk plant and creamery.

First off, let it be remembered that heat and ven tion are two distinctly separate problems but mus considered one in relation to the other. This ca readily appreciated when we consider that the am of heat required depends upon, among other things number of air changes provided a given space. Pu it the other way, in obtaining satisfaction from a tilating system, providing varying air changes for removal of excess moisture, it is advisable to have ficient heat available to maintain a given maximum perature at all times.

Failure to give proper consideration to these "air conditioning" units in their relation to each is the cause of most of the trouble experienced wit cessive moisture.

In view of the fact that air will hold more moi at a high temperature than at a low one, it is ob that temperature at a given point in a room will ha bearing on the lack or presence of visible moisture.

A ventilating system, designed to provide ce air changes, and based on a given mean room tem

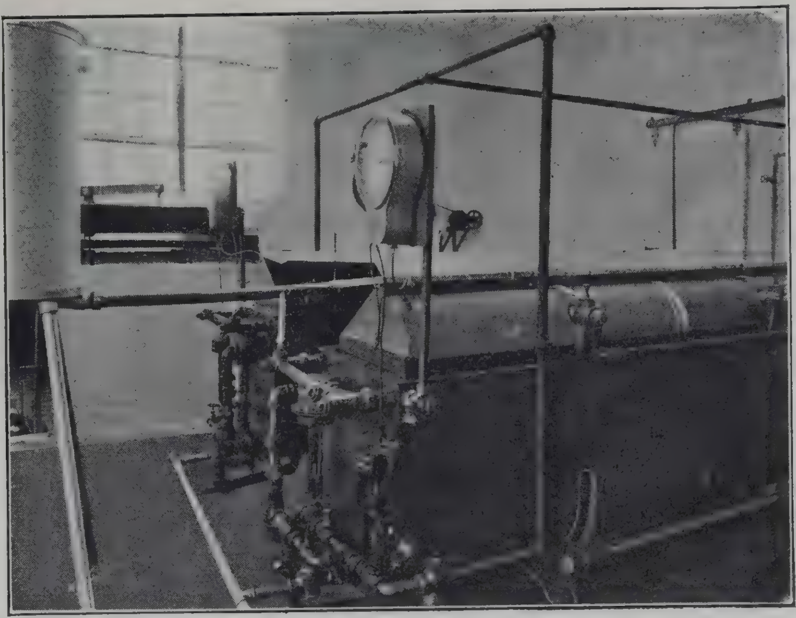
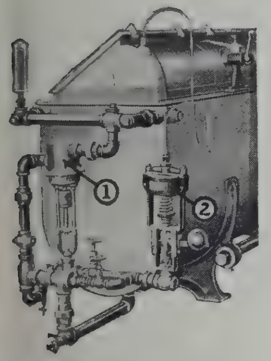
Parker Dairy Company,
Saginaw, Michigan



We Never Overheat a Batch of Milk!"



The Automatic
Temperature Controller

automatic temperature control-
is composed of two simple, in-
endent and entirely automati-
ly-operated devices. Device
ber one is the *temperature con-*
ler which maintains the circu-
ng water at the desired tempera-
throughout the pasteurizing
. Device *number two* is a *tem-*
ture limiting unit, which shuts
he steam when the milk reaches
pasteurizing temperature; this
s the circulation of the heating
er, and prevents overheating of
milk. These features, combined
the *automatic* circulation of
heating water by the *steam-*
rated ejector, make the Burrell
ractically an *automatic* Spray
Pasteurizer.

"Largely on your recommendation," writes the Parker Dairy Company of Saginaw, Michigan, "we installed the automatic steam controls on our new Burrell Spray Pasteurizers in our new plant. We have been operating these controls for several months, and results have fully verified your claims for this equipment. We are able to produce uniform recording charts—*never overheat a batch of milk*—and the temperature is controlled more evenly than is possible by hand. The direct result has been *improved uniform cream lines* on all our milk every day with practically no variation."

Like the Parker Dairy, many plants that are now using Burrell Spray Pasteurizers, equipped with *automatic temperature controllers,* are able to maintain their heating water at a *uniformly low temperature.* And they have found that this *constant, automatic control of temperature* not only ensures *uniform heating of the milk* and *maximum cream lines,* but permits the operator to perform his other duties without continually interrupting his work to observe the progress of the pasteurizing run.

The experience of the Parker Dairy is but one instance of how this *automatic temperature controller* has successfully met the demand for a temperature regulator that would combine *simplicity* with *perfect operation.* It is absolutely self-contained—with no air compressor or other auxiliary equipment. Its very simplicity is the secret of its easy and efficient operation. And the automatic temperature controller not only eliminates the necessity of the operator's constant attention, but its initial cost is surprisingly low.

Write today for illustrated material and further details. There is no obligation.

ture, might still deliver the same number of air changes at a lower temperature with visible results entirely unsatisfactory.

The temperature desired for the work rooms of a milk plant and creamery is generally agreed upon to be within a very limited margin. To maintain, consistently, this desired temperature and to prevent condensation of excessive moisture, the first step is to provide the proper system of ventilation, analyze the varying air changes provided by the system and install heating apparatus capable of maintaining the desired temperature according to reasonable extremes to be dealt with.

However, this does not mean that in such cases where a ventilating system is providing, let us say, six air changes per hour, temporarily, that the amount of heat provided should be figured accordingly. The very manufacturing process which temporarily demands a rapid air change may also be the source of sufficient heat to offset the difference in the number of air changes at that time over another time.

Thus it can be seen that the many factors affecting the related problems of heating and ventilating a milk plant and creamery are sufficient reasons for consulting specialists who are familiar with them.

Any investigation will prove that this course not only means a satisfactory solution but a most economical installation results.

In making the statement that air will hold more moisture at a high temperature, it must be remembered that it would be difficult to determine at what temperature all of the excessive moisture could be suspended in the air. Granting that this could be determined, the temperature required would be so high in the average plant, that it would be unbearable. In addition, as soon as the temperature dropped, as over night, the air like a sponge would squeeze the water out and condensation would form on convenient surfaces.

If the changes from hot to cold, wet to dry, were continued, a more rapid decaying condition would prevail than under a consistently wet or consistently dry condition. This is borne out by the pile, standing in water, which rots at the water line first.

Thus we establish the fact that to properly condition the air, we must carry out of the building the excessive moisture being added to it at all times and then provide sufficient heat to maintain a reasonably consistent temperature according to the evident requirements.

This heat can be obtained in many different ways. Heat can be classified, however, into two types, direct and indirect.

The latter is rapidly replacing the former in use in milk plants and creameries as well as all industrial plants. The original type of direct heat used, the stove, was replaced by steam radiators. The steam radiator, the present form of direct heat in general use where indirect heat is not installed, has many disadvantages that are causing its rapid replacement by the latter type. Direct radiation takes up a considerable amount of valuable floor space as compared to the indirect system of like capacity. It takes a considerable longer time to raise the temperature of a room from one point to a higher with direct radiation than with the indirect system of the same rated capacity. This is true because of the necessity of the heat from the radiators traveling through the air while the indirect system recirculates the air over the heating surfaces. In addition, it is usually true that the air of the room can be kept at a
even, consistent temperature by the use of recir
ing system than by direct radiation. Indirect sy
can be obtained for which many other advantage
claimed, hower, let it suffice to say here that the
larity of this type of heating system for milk plant
creameries is increasing each year.

Some plant owners have purchased recircul
heating systems with a view toward removing thei
densation from the building as well as to heat the
It is a mistake to confuse the purpose of a heatin
tem with that of a ventilating system. Recirculatio
heating air does not reduce the actual amount of
in air by volume, but merely increases the car
capacity. A room made comparatively air-tight
filled with steam, could quite possibly be heated
degree that would remove all visible presence of
ture. If the temperature arrived at is higher tha
consistently desirable, however, the presence of moi
will be evident as the temperature is dropped to no
Air is like a sponge, heated it expands and holds
moisture; cold it contracts and squeezes the moi
out in the form of condensation on surfaces cooler
the air itself.

The only way excessive moisture can be actuall
moved from a closed space, is to change the heavily
air inside with drier air.

Some recirculating heating systems have bee
stalled that are provided with by-pass ducts, mixi
limited amount of outside air with the air in the
in the heating system. Then an out-take duct has
placed at a convenient spot, for removal of the
damp air. This is at best only a slight improveme
view of the fact that in most cases, the actual air ch
in the room is insufficient and the cost of heating is g
er than it would be were the fresh air admitted in
quantities near the ceiling at various points and
slow rate of speed.

Another objection to this type of so-called hea
and ventilating system can be found in the spring
fall. There are quite a few months of the year whe
heat is desired, but steam escaping from vats,
washers, etc., demands a rapid air change. Unle
ventilating system to handle these conditions has
provided, the condensation resulting will be both
gerous and costly. If the recirculating heating sy
were relied upon at this time, it would not only
partially handle the condition but would raise the
perature of the room far beyond the point where it w
be comfortable.

Summarizing the economic facts concerning heat
ventilation in the milk plant and creamery, it ca
readily established that the task of each system is
tinctly different. At the same time, effect of one u
the other makes it necessary to consider them toge
in order that the best results under prevailing condit
may be accomplished.

Not a little loss of prestige, time, health and m
has resulted from a careless or misinformed atti
toward these two problems on the part of plant ow
and operators.

An employee's health has been lost, valuable
chinery allowed to spoil rapidly, building materials h
given out long before their time, efficiency decreased
an inferior product allowed to reach market when
aceptance of the services of experienced specialists

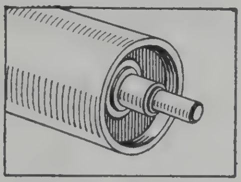
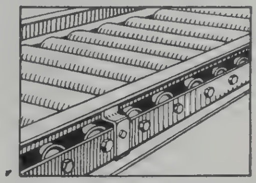
ast longer. THE LAMSON COMPANY
SYRACUSE, N. Y.

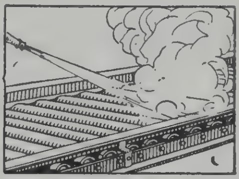
LAMSON
SANITARY
CONVEYORS



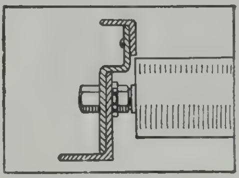
1 *Moisture can't get in.* Corrosion comes with moisture. Keep moisture out and you prevent corrosion. Lamson Rollers extra-heavy throughout, have heads *welded in*. No joint through which moisture can enter. No inside corrosion. Remember that.



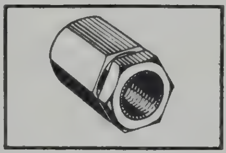
2 *Special guard rail over roller ends.* This heavy angle iron guard rail, setting in over the ends of the rollers, prevents can-chimes from dropping off and blocking the conveyors. *And this saves wear.* Sliding cans over rollers that can't turn wears out the rolls and the cans, both. The Lamson conveyor never stalls or blocks.



3 *Stands up under flushing and steaming.* Turn the hot water on it as often as you please. Steam it often as you want. You can't harm the bearings, you can't force any moisture into any part where it will be harmful. Lamson has designed this conveyor to stand a limitless amount of cleaning.



4 *Practical mounting.* The frame is so designed that it forms a cup-like protection to keep moisture and milk away from the shafts and bearings. This mounting maintains dryness of the moving parts, even in conditions where a great deal of moisture is present. It adds greatly to the service of Lamson conveyors, and helps to prevent rolls from sticking.



5 *Non-corrosive bearing of special design.* The bearings are cast of non-corrosive alloy. They are extremely resistive to all corrosive action. They are hexagonal in shape, so inserted in the frame that they can never turn with the shafts. Consequently they cannot freeze, and always operate.

The Lamson Co.,
Syracuse, N. Y.
I am interested in finding out **all** the reasons why Lamson Sanitary Conveyors operate at **low cost.**

The Re-Discovery of Mil

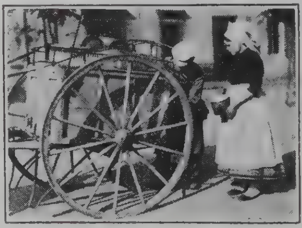
Man's Most Important Food Product During all the Ages. "Come, Buy Wine and Milk Without Money and Without Price."

By
PROF. R. M. WASHBURN
MINNESOTA

WHY did our fathers and grandfathers think so lightly of milk as a food, regarding it a little better than an agreeable drink when peoples for ages past have known its food value? Not only did antiquity know and teach milk, after their fashion, but throughout the intervening ages some people have known milk well and some men amidst all civilized groups have taught the use and the value of milk.

From the advertising that has been given to milk and milk products during the past few years, it might be thought that the product, milk, were a beautiful new discovery, like radium. It is, in fact, more a re-discovery, or better, a blooming, because of science, of the bud which has been growing for thousands of years by common experience.

Butter Seller of Persia.



Somewhere in Germany

Reviewing briefly the literature of the past and bringing down the quotations and references, we have a continuous chain of statements which prove the high regard in which milk and milk products were held by various people, as for example the following:

Genesis 18:8 "And he took butter and milk....and they did eat."

Genesis 49:12 "His eyes shall be red with wine and his teeth white with milk."

Joshua 5:6 "....A land that floweth with milk and honey."

Judges 5:25 "He asked water and she gave him milk; she brought forth butter in a lordly dish."

Proverbs 30:33 "The churning of milk bringeth forth butter...."

Isaiah 55:1 "Come—buy wine and milk without money and without price."

Lamentations 4:7 "Her Nazarites were purer than snow, they were whiter than milk; they were more ruddy in body than rubies...."

Ezekiel 25:4 "....They shall eat thy fruit and they shall drink thy milk."

1 Corinthians 3:2 "I have fed you with mink and not with meat; for hitherto ye were not able to bear it...."

Hebrews 5:12 "....and are become such as
need of milk, and not of strong meat."

1 Peter 2:2 "As new born babes, desire the si
milk of the word that ye may grow thereby."

The wise King Solomon not only encouraged
keeping of dairy animals, but he issued this comma
his followers: Proverbs 27:27 "Thou shalt have g
milk for thy food, for the food of thy household,
for the maintenance of thy maidens."

Josephus, the great historian, 37 to 95 A. D., a
temporary of St. Paul, wrote "Abel brought milk
the first fruits of his flocks as offerings." Some orie
have a tradition about milk to the effect "that the
rivers of Paradise consist of **milk, wine, honey** an
and Adam, who required no food, drank of the
and tasted of the fruits." Thus we note the commo
of the knowledge regarding milk and the high pla
which it was held among oriental peoples.

Here are a few more pictures of the past. H
(9th century B. C.), a poet of Greece, frequently
tioned milk and cheese as articles of food. Herod
(5th century B. C.) also wrote of the use of milk
food. Hippocrates (5th century B. C.), speaking o
Scythians, described
great minuteness
processes of making bu
and highly commends
as a most healthful and
ishing food. Among
Asiac Russians mare's milk was gathered in wooden vessels for general use and it still is done in much the same way.

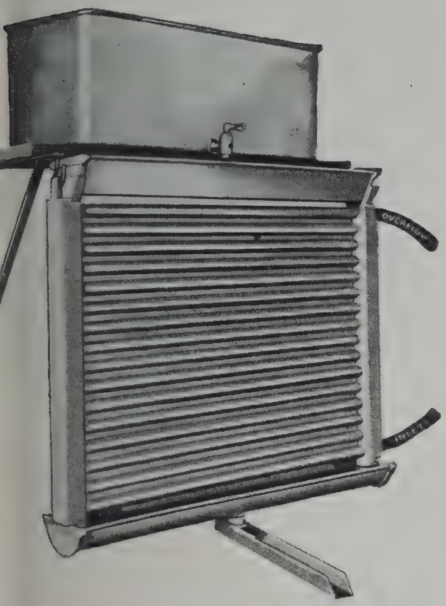
High, High, High up in the Alps

An Oriental Milk Distributor

"Ancient Rome was built by hunters and herdsmen. Romulus, its founder.
years B. C., traced a furrow around the Palatine
with a plough drawn by two milk-white cattle, and ca
the area within the furrow to be inclosed with a wa
earth; he then poured out libations of milk to propi
the gods. Eight hundred years afterwards Pliny
lates, that the devotional offering of milk, in comm
oration of the custom of their fathers, was still
tinued."

In this connection it is interesting to note that

QUALITY Uhlmann-Kinsey Co. Incorporated PHILADELPHIA. PENNA. COOLERS



Encourage Your Patrons to Buy a Quality Cooler!

Eight years ago, the first U-K Farmers Cooler was exhibited at the National Dairy Show in Chicago. It was an immediate success. Dairymen from every part of the country voiced their hearty approval of it because this U-K Cooler was then far in advance of any other milk cooler. Even the smallest details showed that the best brains and engineering skill had been expended upon them.

and Reduce Acidity

Today the U-K Farmers Tubular Cooler is the accepted standard for cooling milk on the farm. Several improvements have still further increased its cooling efficiency; and we have customers who are regularly receiving milk throughout the hottest weather with only 14½% acidity.

Be certain of getting low acidity milk by having your patrons install U-K Coolers. Don't accept anything else as a substitute. Insist on U-K Coolers. They mean better milk and increased profits to both you and your farmers.

U-K Coolers are made exactly like the larger coolers for milk. Either water or brine can be used. Made of copper and bronze and will withstand 150 pounds pressure. Can be had in large or small capacities, with or without pump, stand, reservoirs, etc. Write to nearest supply house or direct for illustrated literature and prices.

instead of wine recently was used in christening a Grand Trunk ship built at Manitowoc, Wisconsin, ship building yards.

In connection with the laying out of the City of Rome, it is of interest to note that the very name "Italy" is said to have been from the ancient Greek language and so called because of the abundance of oxen in it.

Pliny (writer of natural history, 1st century A. D.) refers to several eastern nations whose people subsisted largely upon milk and "who so managed their stocks as to secure an abundant supply of milk through the year."

Strabo (Greek geographer and historian, 1st century B. C.) gives much the same account of Aethiopians, Lusitianians and other peoples" among whom milk was one of the chief means of subsistence."

Virgil (Roman poet born on a farm 70 B. C.) devoted his Third Georgic to the subject of breeding cattle.

Apicius (famous Roman writer on cookery, 3rd century A. D.) and others of his day made the quality of milk the subject of special study.

Aristotle (4th century B. C.), often considered the "father of natural history," in his book on "Animals" gave many interesting pictures relating to milk and cheese and duly appreciated both as articles of food.

Records from East India show that butter was used at least as early as 2000 years B. C. and still is.

Thus in general terms but none the less positively, milk was appreciated, cultivated and used by men. From the Swiss highlands to the Holland marshes; from the southern plains to the Scandinavian, Finnish and British hills; from the wide open ranges to the closely inhabited centers, cows were the answer to man's prayer for life under hard conditions. In America at present cows are kept profitably from Cuba to Alaska, from the tide meadows to the mountainous plateaus; from sparsely settled prairies to densely populated centers; from the low priced farms on the outskirts to the high priced farm in our central states; from the semi-arid sections of our western plains where there is but 15 to 20 inches rainfall per year to the Pacific slope where the annual rainfall is 10 feet or more, cattle, cows and milk are the answer.

Glancing back again to an early date, we quote the following from Hartley: "The milk of animals is more generally used as aliment by man, than any other description of animal food. That of the camel is chiefly confined to Africa and China, and of the mare to Tartary and Siberia. In China, especially about the city of Canton, no other milk, it is said, can be obtained but that of the sow; while in India, the milk of the buffalo is preferred to that of the domestic cow. In Lapland and in some other northern countries, the milk of the reindeer is highly valued and extensively used. Goat's milk is more generally used in Italy and Spain, than in other countries in Europe. The animals are driven into Leghorn, Florence, Madrid and other towns in flocks early in the morning, and milked in the streets. Ewe's milk is gradually wearing out of use." Caesar reported that the Germans lived on milk, cheese and meat. And rugged people grew thereon.

Holinshed Chronicles (1577): "I find among the writers that the milk of a goat is next in estimation to that of the woman, for that it helpeth the stomack, removeth oppitations and stoppings of the liver; and looseth the belly. Some place also next unto it the milk of the ewe, and thirdly that of the cow."

Thomas Coghan, Master of Arts and Batcheler of Physicke, London, England, in "The Haven of Health" (1636) states:

"The art of Physicke (right honourable) by the judgment of the learned, hath two principal parts: the one declaring the order how health may be preser the other setting forth the means how sickenesse may remedied. Of these two parts (in mine opinion) tha more excellent, which preserveth health and preven sickenesse. For as much as health is the most per state of man's body in this life, and the onely enc mark whereunto the physician directeth all his doin ..Even as it is better to stand fast still than fall rise againe, better keep still a castle or city, than a we have suffered the enemy to enter, to rescue it aga —-Asclepiades, that famous physitian, learned in manner and the use of medicine, bent all his study the order of dyet.

"And some that bee of a sound constitution by ture, doe yet through intempreancy so corrupt t complexion, that either they live not untill they be or else their old age is most fulsome and lothsome... this number chiefly the courtiers, lords, ladies, gen men and gentlewomen, though not all, yet moe than the common people. For these live not so long as inferior sort.

"A third kind of meats, which is neither fish flesh, commonly called white meats, as egges, milk, ter and cheese. Henne egges are best.

"Milk is made of bloud twise concocted, for un it come to the paps—or udder, it is plaine bloud, afterward by the proper nature of the paps it is tur into milk. Deo sco givith this commendation to m generally. Lac genevasum omne boni succi eft, cor alit, aluum emollit slomachum and intestina exat.

"But this last inconvenience may bee holpen, as teacheth after word 'minus inflat quodcunque se ferve factum est.'

"And I was want to helpe it by putting in a li pepper, cloves and mace.

"Milke, not withstanding that it seemeth to wholly of one substance, yet it is compact or made three severall substances, that is to say in effect, creame whey and curds, of creame is made butter of curds cheese of which I shall entreat afterward. of milke there is great difference, nor onely concen kinds, but also touching the time of the years. For milke is thickest and the milk of the cammel is thinn and the milke of a goate is between both. Wheref is the governance of health, goats milke is best and milke is next. Yet the goodnesse of the pasture help much to the goodnesse of the milke; for ill pasture m ill milke, and good pasture make good milke; for s as the food is the bloud and such as the bloud is, suc the milke....And touching the time of the years I that in the spring time milke is thinnest and at the of the leafe it is thickest and best according to that saying—'When ferne waxeth red, then is milk good bread.'

"And, how naturall and nuirishing a meat, milke may be perceived not only by children who live and better with that, than with any other thing; but men and women, who being used from their childh for the most part to milk, and to eat none or little ot meat but milk and butter, appeare to be of good c plection and fashion of body and no morvaile; for w milke is well digested, it engenderth good bloud, giveth great nourishment, yea it is a restorative to th that bee wasted or in a consumption or be lean as peareth—in Scho. Sal. in these words—

"Lacs hecticis sauum, caprinum, post camelinum nutritivum, plus onini bus ast asininum plus unt vuum vaccinum, sic ovinum ad sit si febris, caput doll fugiendum est.

"Whereby it appeareth that goats milke is princi in a consumption because it is not so thinne as can milke or asses milke, nor so fat and thicke as

GABEL CREAMERY COMPANY
REFRIGERATOR MILK SERVICE

e Gabel Creamery Company, Detroit, is widely known as a successful Creamery organization. Fruehauf Semi-Trailers with Refrigerator bodies nd Fruehauf 4-Wheel Trailers with Tank bodies—are helping Gabel to get record-breaking results from their operations in the Detroit territory.

OTAL ANNUAL SAVING OF $31,132

READ this brief summary of savings effected in Milk distribution by the Gabel Creamery Company, of Detroit, through the use of Fruehauf Trailers:

Seven 10-ton Semi-Trailers and two tractor-trucks are used to distribute cases of bottled Milk to Branches. Oldest Trailers have been in service every day for two years. Daily tractor route covers 41 miles. Average Trailer load is 18,500 pounds ---300 cases. Daily hauling unit cost is $24.11 for tractor, four Trailers and two "Dollies." Cost per case is $.0201.

5-ton truck could carry 280 cases and make same deliveries, but in longer time---at a cost of $.0303.

Trailers reduce hauling cost over $.01 per case, *saving $16,892 a year.* Reduce handling labor cost. Eliminate need for refrigeration at Branches. *Total annual saving is $31,132! Returning 134% on investment annually.*

It will pay you to get the complete details of this interesting experience in low-cost transportation. Write today for your copy of a Survey made by the A. C. Nielsen Company of Chicago---a neutral firm of Engineers---in collaboration with Mr. Herman Koelz, President of the Gabel Creamery Company. Your inquiry will not obligate you in the least.

FRUEHAUF TRAILERS

2 Harper Avenue **Detroit, Michigan**

When writing to FRUEHAUF TRAILER COMPANY *please mention The Milk Dealer.*

milke or sheepes milke, yet common experience proveth that womens milke, sucked from the breast is without comparrison best for all in a consumption. (Here the author notes the example of the Earl of Comberland who was nursed back from fever to health on the breast of a woman.)....milke is hurtful to them that have the cholicke, but is especially good for them which be oppressed with meloncholy, which is a common calamity to students, and for this purpose it should be drunke in the morning, new milked warme from the udder.... Take milke warme from the cow, or else new milked, and heate a gad of steele or iron glowing hot in the fire, and quench it therein, so doing nine or ten times, together, then drinke it fasting and it will helpe.''

The author here goes on to tell how to boil (boyle) leaves of certain herbs in the milke to improve flavor and make more medicinal. Again he urges women, who have children to raise, to provide abundance of May butter.

Schola—Salerni saieth ''Lenit, humectat Soluit, sine butyrum.''

In speaking of cheese he says....

''Cheese should not be white as snowe is, nor ful of eyes as Argos was, nor olde as Mathusalem was, nor full of whey and weeping as Marie Magdalen was, nor rough as Esau was, nor full of spots as Lazarus was.'' Some cheese he had.

''The second thing that is to be considered in meats is the quantity, which ought of all men greatly to bee regarded, for therein lyeth no small occasion of health or sicknesse, or life or death. For as want of meat consumeth the very substance of our flesh, so doth excesse and surfet extinguish and suffocate natural heat wherein life consistheth....The quantity of meat be such, as may be well digested in the stomach. That is according to the nature of him that eateth, not always—according to appetite....

''Pone gule metas, ut sit tibi longior etas esse copis sannes? sit tibi parca manus—

''But the greatest occasion why men passe the measure in eating, is variety of meats at one meale. For such is our custome by reason of plenty weare served with sundry sort of meats at one meale. Yea the more we would welcome our friends, the more dishes we prepare, and when we are well satisfied with one dish or two, then come other more delicate, and procureth us by that means, to eate more than nature doth require.

''Thus variety bringeth us to excess and sometimes to surfit also. But Physicke teacheth us to feed moderately upon one kinde of meat only at one meale, or at the least wise not upon many of contray natures.

''And if nature bee so strong in many, that they be not sicke upon a full gorge, yet they are drowsie and heavy, and more desirous to loyter than to labour, according to that old meeter—Distenus venter villet dermire libeuter.

''Yea the minde and wit is so oppressed and overwhelmed with excesse, that it lyeth as it were drowned for a time and unable to use his force—for true it is according to that olde say—'When the belly is full the bones would be at rest.' ''

Then follows description of Oxford and Cambridge students who live for the most part on one or two meals per day and only one or two kinds of food per meal.

''And doe live and like very will therewith, and for the most part are as cleane men of personage as may be seen (in England).''

In the above quotation we have several pictures of the period in England but we also receive in this, a picture of the status of knowledge regarding milk, of what it was composed, and its general handling.

The Mayflower, in coming to Plymouth Rock, di bring cows but ''Edward Winslow, having been se England as an agent for the colony, on his retur 1624, brought three heifers and a bull, which were first neat cattle brought to Plymouth. The settler course, had been destitute of milk, the first four y In 1630, there was another importation of twenty- cows, but ten were lost at sea.'' Horses were first ported to the colonies in 1644 according to col records.

Edmund Burke (1729-1797) stated: ''Milk is the support of our childhood. The component parts of are water, oil and a sort of a very sweet salt called s of milk. All of these when blended have a great sm ness to the taste, and a relaxing quality to the skin

John Burns, M. D. (1817) wrote: ''Milk consis cream, curd and whey; and the whey, the greatest tion of which is water, is the only part that bec sour. The quantity of cream is greatest in ewe's next in that of woman, the goat, the cow, and then ass and the mare. The proportion of whey is gre in the milk of mares and women and then the cow the sheep. Woman's milk contains more cream cow's milk, yet no butter can be made from it.'' he goes on to explain that cow's milk should be mod for infants and gives a method very similar to those being advocated.

Robert M. Hartley, New York, in his classic ''E on Milk,'' 1842, says: ''Next to water, which is natu own beverage and the proper diluent for man, milk, in our artificial modes of living, is an article of i pensable necessity, and universal use....Holdin medium place between animal and vegetable diet, pure it is at once the most palatable, healthy, and n tive aliment with which our nurseries and tables ca supplied. It is not surprising, therefore, that imm quantities are used, or that so much importance sh be attached to it as an article of diet for children.''

The Alchemy of the ancients, seeking directl convert cheap metals into gold, got nowhere in partic while modern chemistry, s ing to serve man in every possible, produces health economy from which sp true wealth. The present chemistry, delving patie into the hidden secrets of composition of foods, fe soils, fabrics, woods, d paints, metals, and a m tude of other special fi has unlocked for us som the truths we all need. T the long close study in dairy chemistry reveals t that milk is a complex mixture of compounds, each ing its own nature and its own service to perform. ash of milk is composed of eleven mineral salts w service it is to build bone and teeth and to assist ot wise in regulating bodily conditions. The fat of mil in reality an intimate blend of nine fatty compou some of which are volatile, others non-volatile, som which melt at a low temperature, others at a high perature and altogether furnishing energy and war to the body. Though milk is not particularly swee is rich in sugar which is a mild warmth and ene giver, especially adapted to the needs of the yo children. The fat, serving much the same purpos better adapted to the stronger, it being 2¼ more hea than sugar. The cheesy constituent of milk is ca and with it in milk is associated albumin, closely sim to the white of egg in nature, and these together

Battery of Cold Storage Rooms—Somerset Farms Creamery, Boston, Mass.

IT'S INSULATION TIME!

Now.....

is the time to think of that new insulation work which you will require.

YOU KNOW that your investment in insulation for Cold Storage Rooms, Tanks, Pipe Lines, etc., brings you a return that is larger than probably any other portion of your equipment. Even so, any expenditures for repairs or improvements, should be held to a minimum. ¶ For twenty years—Owners, Architects, and Engineers have relied upon "UNITED'S SERVICE" for their insulation work. They have learned that the most economical and efficient Cold Storage Rooms are obtained when the installation is made complete by UNITED, using CRESCENT 100% PURE CORKBOARD. ¶ Each installation is made by thoroughly trained mechanics working under the personal supervision of experienced engineers. Only modern—tho time-tested-methods of application are used. Consequently the resulting installation is the best that can be produced. ¶ The smallest to the largest plants in the country avail themselves of "United Service."

Specify— **Crescent 100% Pure Corkboard and "United Service"**

several other proteins are the building materials for muscle and blood. Now come vitamines, all the kinds of which are found in milk in varying quantities, whose function it is to regulate bodily glands, promote growth and ward off various diseases.

No wonder then that Herbert Hover said in 1917: "The white race cannot survive without dairy products."

And yet despite these long ages of intelligent experience, augmented by modern science with its thousands of tests on all kinds of animals, including the human, with its tons of excellent literature and its years full of lectures, all of which confirm, explain and amplify earlier convictions regarding the unique value of milk, there are still those among us who think of milk as a mere drink, rather than as a food, who cut down the consumption of milk at first opportunity and complain at the price regularly, all because ignorant of values. "Scientific experience" is gaining, however, especially because of the excellent work done in our schools, our hospitals, our sanatoriums and our homes for the needy of all ages.

There are foods, near-foods and super-foods and milk is a super-food; super because, while doing the work of a plain food, it at the same time corrects and balances the shortcomings of other foods.

Dairying is the greatest stabilizer of agriculture and milk in liberal amounts is the greatest promoter and stabilizer of health.

KENTUCKY MANUFACTURERS HOLD ANNUAL MEETING.

The luncheon and annual business meeting of The Dairy Products Association of Kentucky, held at the Kentucky Hotel, Louisville, 12:30 P. M., Wednesday, March 9, was the most successful occasion of this nature that this association has ever enjoyed from the standpoint of attendance, interest, fellowship and entertainment.

President Vohlkamp opened the meeting on scheduled time and the same precision was continued through all of the affairs of the afternoon and evening. A record membership was recorded. There was apparently no laxity of interest in the various procedures and good fellowship seemed to be universal.

Secretary R. L. Hammond of the Indiana Manufacturers of Dairy Products; F. C. Laskey and R. L. Hardy of Nashville, Tenn., and S. E. Boyle of Mt. Vernon, Ill., were the non-member guests from without the state.

Mr. Hammond addressed the general session on the intangible results of association work and cited a ber of timely examples of his own recent experi Messrs. Hardy and Laskey expressed the general will of the Tennessee manufacturers toward their petitors in Kentucky. C. O. Ewing, whom the Kent association holds in very high esteem as one of its h members, spoke of the high standard of work tha been maintained by the association and likewise sister organizations in Indiana and Ohio. He for a promising future for the dairy industry in Kent and Tennessee. Mr. Ewing concluded his remark complimenting President Chas. G. Vahlkamp, fashion well deserved, for the able manner in whicl management of the association has been directed the interest of the membership sustained.

The election of officers followed. A previously pointed nominating committee, composed of W. D. nicutt, Cincinnati; D. A. Harkness, Jellico, Tenn., F. C. Gunn, Louisville, presented the names of 18 didates for the nine managing directorships of the ciation. The ballots were spread and the majorit votes cast in favor of the following who later met chose, from their own ranks, the special officers o association and its divisions:

* Chas. G. Vohlkamp, City Consumers' Co., Padu president.

* John H. Kloecker, Dixie Ice Cream Co., Lexin treasurer.

(Carlton Ball, 206 Republic Bldg., Louisville, pointed to act as secretary of the board of direct

Ice Cream Division.

* Louis J. Hollenbach, Frozenpure Ice Cream Co., L ville, chairman.

* Harry Cuscaden, Cuscaden's Ice Cream Works, L ville, secretary.

Butter Division.

A. N. Gossman, Armour Creameries, Louisville, c man.

* W. A. Horneman, Sugar Creek Creamery Co., L ville, secretary.

Milk Division.

*Charles Ewing (2nd), D. H. Ewing's Sons, Louis chairman.

* Geo. W. Schneider, Gray-Von Allmen San. Milk Louisville, secretary.

Director at Large.

O. J. Bischoff, Merchants Creamery Co., Cincinnati

The election gave way to the divisional mee where the current questions of the season were g special attention. The members were asked to special thought to the possibilities of the Kentucky l lature which will convene next winter.

At the conclusion of the association's functions the day, the body was adjourned from the Kent Hotel to the Brown Hotel for dinner which was ac panied by vaudeville and unusual entertainment w were supplied by the Louisville manufacturers and supply firms, to the delight of all present.

The next meeting, the final general meeting fo spring and summer seasons, will be held at the Kent Hotel, Louisville, 12:30 p. m., Wednesday, May 4.

CARLTON BALL,
General Secretary.

*(Re-elected as a director.)

Now! ALLOVA Garments in New Fab
—*Stronger and Heavier*

$3.25 EACH

Less In Quantities

For three years, one of the finest cloth mills in the United States has been working diligently in our behalf perfecting an overall cloth made according to our own standards and specifications.

And now it's ready! The Allova Work Suits, Work Coats and Caps you buy now are made of our new material, with the name "Allova" at frequent spaces along the fabric. Thus you can identify the genuine "Allova Cloth."

These new fabrics are eight-ounce cloths, closely woven, and stronger, heavier, longer wearing! In order to guard against the inevitable shrinkage, we cut all garments oversize, and make them two inches longer than ordinary work clothes. Measure an Allova Suit against an ordinary work suit and see for yourself!

These precautions make Allova Work Clothing the outstanding value for the money—in comfort, in service, in long-wearing satisfaction!

Yes, Sir! These new Allova Work Garments are built for real service—"he-man" suits and coats, made in attractive colors, and lettered with the *individual name, trademark or monogram of the wearer!* Advertising that walks and talks!

Workmen take a new pride in their appearance and the appearance of the premises, when they are outfitted in Allova Garments. S uniforms give an air of "class" to any pla business—and yet cost but little more nondescript, shabby overalls.

Sturdy, one-piece, Allova Garments wear and well. Cut big and roomy. Every stitched to stay. Pockets reinforced with d thickness of material. All buttons co Your choice of many colors: solid blue; white; solid khaki; blue and white striped; and khaki striped. Sizes 34 to 56.

work, they transferred one of their ablest men to South Omaha, and in little more than a year he effected a net saving of more than a quarter million dollars.

The milk dealer is having his troubles right now, and there is a tendency for them to get more serious. In the last seven years more than ten million people have left the farms. To that extent they have increased the competition in the cities. The result is higher levels for farm products and a decrease in the purchasing power of the public. A narrowing margin on milk is unavoidable.

⁂

Who Said "Weaker Sex?"

Woman Runs Dairy for 14 Years When Husband is Ill.

Traditions may have taught us since time began that woman is of the "weaker sex," but the story of Mrs. Theodore Ensign of Cleveland, O., is telling us that as time goes on the division may grow to be about fifty fifty, and that some women certainly cannot be classified in this category.

"It's three o'clock in the morning. Time for my dairy chores." That was the song of Mrs. Ensign, off and on, for 14 years. When she became a bride her husband was stricken and was very ill for two years. Mrs. Ensign jumped into the harness and became manager of his dairy.

MRS. THEODORE ENSIGN.

She dipped the milk brought in by farmers from the ice cooled cans into bottles, capped the bottles and then peddled them. Horses were more in style in the first few years of her dairy work. Now she drives a coupe and a truck when delivering milk.

Mr. Ensign still insists that his wife is manager. He oversees the dairy and delivers milk to 16 factories.

Mrs. Ensign sells milk near several factories at the noon hour and peddles milk to homes early in the morning in summer, and in afternoons in winter. She has made 200 calls in three and one-half hours, with a boy to carry the bottles back and forth. She does all the clerical work and collecting.

Mrs. Ensign is very enthusiastic about her job. "Women who have seen me deliver milk to their homes for years say to me, 'Haven't you a husband?' They have never seen him and they wonder.

"But times have changed for us and it is not now necessary that I work in this manner. But I like it so well that I keep at it occasionally. My father is a Cleveland dairyman, as is also my brother-in-law; so you see I'm at home on the job." She further states that one of the most interesting things of their lives is her husband and her at work together. They are friends at it.

This is splendid team work and Mrs. Ensign's sacrifices and hard work to keep the team work up is just the work of one of the thousands of unsung heroes living in the United States today.

ASSOCIATION MEMBERS PREPARE FOR DA
INDUSTRIES EXPOSITION SPACE LEASIN

Membership leasing of display space in the great
Dairy Industries Exposition begins Monday mor
April 25.

The exposition will occupy the entire effective ar
the great six million dollar Cleveland public hall a
large connected annex. The exposition will open o
tober 24 and close October 29. The National Associ
of Ice Cream Manufacturers' 27th annual conve
will be held in Cleveland, at the Hotel Hollenden, Oc
24-27, inclusive. The 20th annual convention of th
ternational Association of Milk Dealers will be he
the Neil House, Columbus, Ohio, October 19-22, inclu
the latter half of the week preceding the Monday
ing opening of the exposition in Cleveland.

The Machinery and Supplies Association, from
address to which it has just moved in order to o
necessary quarters, 225 West 34th St., New York
has notified its nearly 200 member houses scat
throughout the country, of the "zero hour" of the
ing of reservation opportunity in this year's u
showing, for all the dairy products industries here
abroad, of the complete range of essential machi
equipment, materials, supplies, services, access
processes, etc. Reservation of space is made by telep
telegraph, letter, etc., from the various executive o
of these member houses.

Last year the first five days of the leasing period
90 per cent of the entire area of the Detroit Dair
dustries Exposition reserved by member companies.
fact so heavy were the reservations made, that a ge
appeal had to be made by the association to member
panies to reduce their space holdings in all possible
It will be recalled by the nearly 9,000 trade visito
the Detroit exposition that, as finally assembled,
year's great show extended, and without wasteag
space, over some four acres of area.

To facilitate the membership leasing, which will b
on April 25, it is necessary, the association announce
arrange for additional temporary telephone connect
and for special branch office telegraph service for a
eral days' period.

The exposition committee of the association, and
association's permanent staff have been working
months on the completion of the necessary arrangem
both in Cleveland and through the association's
York offices, which must precede the preparation
issuance of a leasing plan, their activities having
authorized and checked, in accordance with usual
cedure, by the board of directors of the association
executive committee.

⁂

DAIRY COUNCIL WORK ORGANIZED IN INDI

Dairy Council work is to be conducted in
Haute, Indiana, through the Indiana Dairy and
Council, following completion of a local organizati
a part of the National Dairy Council.

Under the direction of trained women the In
Dairy Council has been working more recently in
cennes. With the organization of a Terre Haute Co
the Indiana service is extended to another city.

Milk dealers and producers in Vincennes and
Haute are financing the dairy council's broad pro
of promoting child health and human welfare, as
ducted by the National Dairy Council.

Special Training of Truck Drivers

Driving Habits That Save Dollars Can Be Instilled. Economical Operation Means Efficient Operation

By S. K. HARGIS*

WITH milk plants throughout the United States going in more and more for completely motorized cartage service, and in the face of the particular needs of the trade in that respect, a great deal can be saved in time and money by a proper and special training of milk truck drivers. Most milk plants doing a large wholesale business are learning, as other industries have learned, that privately owned truck fleets are just as efficient and worth while as the drivers who man them. The milk trade has a demand for a higher type of driver than have many manufacturing industries and as transport is a large item in milk plant operation, efficiency depends to a great extent upon securing the right type of driver.

There is wastage of product to be considered and the necessity for promptness. Whether in terminal haulage or route work, the milk industry demands well trained truckmen, especially with regard to their careful and economical handling of the units under their control.

Cartage contract hauling has not proved successful in all cases in the market milk business. That is why so many large plants have totally eliminated the system from their business.

Milk plants are finding out that with proper driver regulation the operation of private truck fleets become an actual economy though mismanagement will result in heavy losses.

The main points of instruction for truck drivers in the trade may be classified under definite headings:

Wastage in Driving with a Foul Plug. Untrained truck drivers in the trade habitually drive for long distances with fouled plugs, doing great damage to the truck engine as a result. Here is a waste of fuel that runs into heavy figures in a short time. The plant pays the bill.

About one-quarter of the value of the fuel is lost with one fouled plug. Do your drivers carry extra plugs to meet these conditions? Do you impress upon them that they must not drive your trucks with a missing plug?

Drivers "Race" Engines in Cold Weather. The greater percentage of the truck drivers employed in the trade habitually "race" engines when starting in cold weather with the idea of getting off faster. It is generally agreed by garage bosses who know their business that bearings are often burned out in this way owing to the failure of the cold oil to circulate promptly. The time spent to gradually warm up the oil and thereby get circulation is more than offset by the danger of burning out bearings. A large percentage of the burned out bearings in plant trucks are the result of this driver carelessness.

Do you see that your drivers refrain from racing cold engines at the start off?

Gas Saved by Low Throttling. A large concern in the trade, with sixteen trucks, made a big saving in gas by requiring all drivers to throttle down all motors when idling at terminal points. It was found that all of the drivers regularly "raced" their engines while waiting.

The unloading of a large truck at a terminal poi, at a major delivery point may take up enough tir use up several gallons of gasoline if the engine is all to "race." "Racing" under these conditions is mo less of a habit with truck drivers in the industry. result shows up on the fuel bills. Do you impress your drivers regularly that this practice is forbidde?

Uneven Acceleration is Wasteful. Any large cor in the trade will find it a paying proposition to in through constant coaching, the habit among their t drivers of stepping on the gas only when really ne sary. Many drivers have the little habit of steppin the foot throttle needlessly when about to pick up. is obviously poor and wasteful driving. Frequen celeration, even when idling, is a habit that is hard t out of the system of the average truck driver int trade. It is not always simple to convince him in respect, though he may be wasting much of the gas that the firm places in his tank. One of the largest pl in the trade recently made a test that proved the effi of careful gas feeding in truck operation. Two tr of identical capacity and engaged in identical work carefully checked up. "A" truck was manned notoriously wasteful driver, the other, "B", by the t fleet boss himself. The experiment covered a w Here is the figures on the results:

	Mileage	Gals. Gas	Oil	Deprecia
A	408	47.01	4 gals.	4%
B	570	31½	3 gals.	3%

Careless and needless acceleration is uncalled for. you instruct your drivers against this habit?

Savings in the "Coasting" Habit. Many of the l plants constantly impress upon their drivers the sav to be when possible, in coasting. Even at the cost o starting the engine, at the other end of the grade, c ing pays. It is true that hills where coasting is fea are not always plentiful within the trucking rang many plants. But even though they are not, a lot of is saved on a heavy truck if the driver habitually c where he can.

The little habit of coasting a truck up to all sto a good one and saves a lot of gasoline. Many drivers fer to race up to a stopping point and then come dead halt by the use of the brakes. This works a h ship on the truck in general. Besides, it is dange Do you caution your drivers concerning this matter

Testing Brakes for Heat. In one large plant I re ly visited, drivers are now required to test brakes at quent intervals in order to see if they are dragging

The test is simple. After running a short dist without using the brakes, the driver stops and gets d to feel the drums. If the drums are heated, the br are dragging.

Do you post your drivers on this precaution?

Reports of Trouble. It is now customary an drivers of the largest trucks in the trade to report as as possible of the occasions when the unit "doesn't to be running just right."

One large Eastern plant now supplies drivers

CO:K THE PHENIX DAIRY.

MORE PROOF!

of the SUPERIORITY of the

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**

form cards which are filled out and turned in whenever the truck they are driving doesn't function properly. When a driver fails to make such a report and something goes wrong, he is called to account.

These are the chief points in truck operation which will go farthest to save operation costs.

The question is: How shall the plant management enforce such a set of rules?

In some cases they resort to a series of penalties, mostly in the form of cash deductions from wages, where the same offense is repeated. But the most efficacious method is to ingrain these habits into the drivers. I know one fleet boss for a large plant who makes himself something of a nuisance to his men in his determination to get them into the right driving habits.

He checks them up on all major points and watches results closely. The cost sheets of each truck tell him just what his men are doing out on the streets. He believes that economical driving is merely a matter of good driving habits. And that it is easy for the driver to get into the good habits as into the bad.

Many of the truck drivers who apply for work in the trade have acquired bad driving habits. These have to be overcome.

Every truck driver poses more or less as a wise guy, and resents anybody trying to show him how to drive, and the boss should never approach him in that spirit. He should, rather, show the driver a few little tricks that will save the concern's gasoline and oil, as well as parts. Where the plant has no fleet boss, the job of training drivers along lines of economy is harder yet.

It is now generally accepted as a fact in the trade that to pay truck drivers a higher wage in order to get their co-operation in economical operation is a wise policy.

If, by careful driving, the truckman can save the plant a hundred dollars a month, it is good business to give him a share of it in the form of a bonus, or higher wage. For economical operation also means efficient operation and better results.

SALESMEN TURN ADVERTISING ARTISTS.

The Salesmen's Club of the Dairy and Ice Cream Machinery and Supplies Association a number of weeks ago announced a contest among its more than 1,000 members who call upon the dairy products plants throughout the United States and Canada—a competition in suggestions of phrasing and design for an advertising poster to give announcement to the great Dairy Industries Exposition which will occur in Cleveland, O., in October.

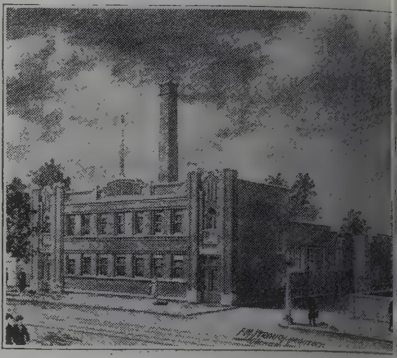
Many of the members of the club—which includes, in some instances, executives as well as the territorial sales representatives of member houses of the parent association — participated in the competition, and successful commercial artists were asked to pass upon the suggestions submitted. Recently the club announced that "while no one particular sketch or idea submitted has been accepted in detail, it has been decided as an evidence of appreciation for work well done, to award prizes of equal value to the following club members." The club announcement then listed, as co-equal winners:

Mrs. Louis F. Nafis, Louis F. Nafis, Inc.; W. H. Badke, The Milk Dealer; Walter C. Gindele, P. Wall Mfg. Supply Co.

The club announcement also included honorable mention of: Fred L. Ryon, Citrus Products Co.; Baldwin L. Jagger, Bloomer Brothers Co.; John W. Newton, Foote & Jenks; D. L. Brodie, Wildberg Box Company.

ANOTHER FINE MILK PLANT IN CHICAGO.

Benson's Dairy, 4842 West Walton St., Chicago, just completing a fine modern milk plant at 1240-46 Cicero Ave., about a block from their old location. new plant is spacious and well appointed and embra many of the best ideas of good milk plant construction.



Gust. Benson, the owner, has studied not only the layout but the equipment with the idea ever before him of making this one of the neatest and most sanitary dairies to be found anywhere. The production of high grade, uniform milk is the constant thought of "Gus

Mr. Benson, who is one of Chicago's younger m dealers, commenced business for himself in a small v about eight years ago. Through thrift, hard work a service to customers he has built up a business comp ing about 20 routes, a new plant costing upward of $1 000.00, and the good will of a host of satisfied patrons

NEW TREATMENT FOR MILK.

Prof. Samuel C. Prescott, head of the biology a public health departments of Massachusetts Institute Technology, gave an address entitled, "Milk and Sanitation and Relation to Public Health," to memb and guests of the Milk Dealers' Association, Bost Mass., at the monthly meeting of the association.

Prof. Prescott discussed the importance of milk a food, went into detail to explain milk and microb and also fully explained tests that he and other expe have made in a development in the milk industry t he says is very far reaching and a distinct step forwa The latter part of his talk was with reference to the el tropurification of milk, a process which, he claims, t have proven kills off pathogenic organisms, reta flavor, cream line and excellent keeping qualities. It i rectangular piece of equipment with carbons form opposite sides, and the milk acts as an electrolite, o conductor of the current from the two poles.

There are 220 volts, 60 cycles of alternating curr passing through the milk, which produce infinite lines electrical force working to bring the temperature to cell, or the molecule, of the milk without waiting fo film of definite thickness to be penetrated by the abso tion of heat from a heated surface.

According to Prof. Prescott, the individual work on the farm is the cause for much of the bacteria in m "Figures show that in the state of Massachusetts alo there are 1,300 human typhoid carriers, which is a v good argument in favor of the electropurification milk. This treatment of the milk began in England 1914."

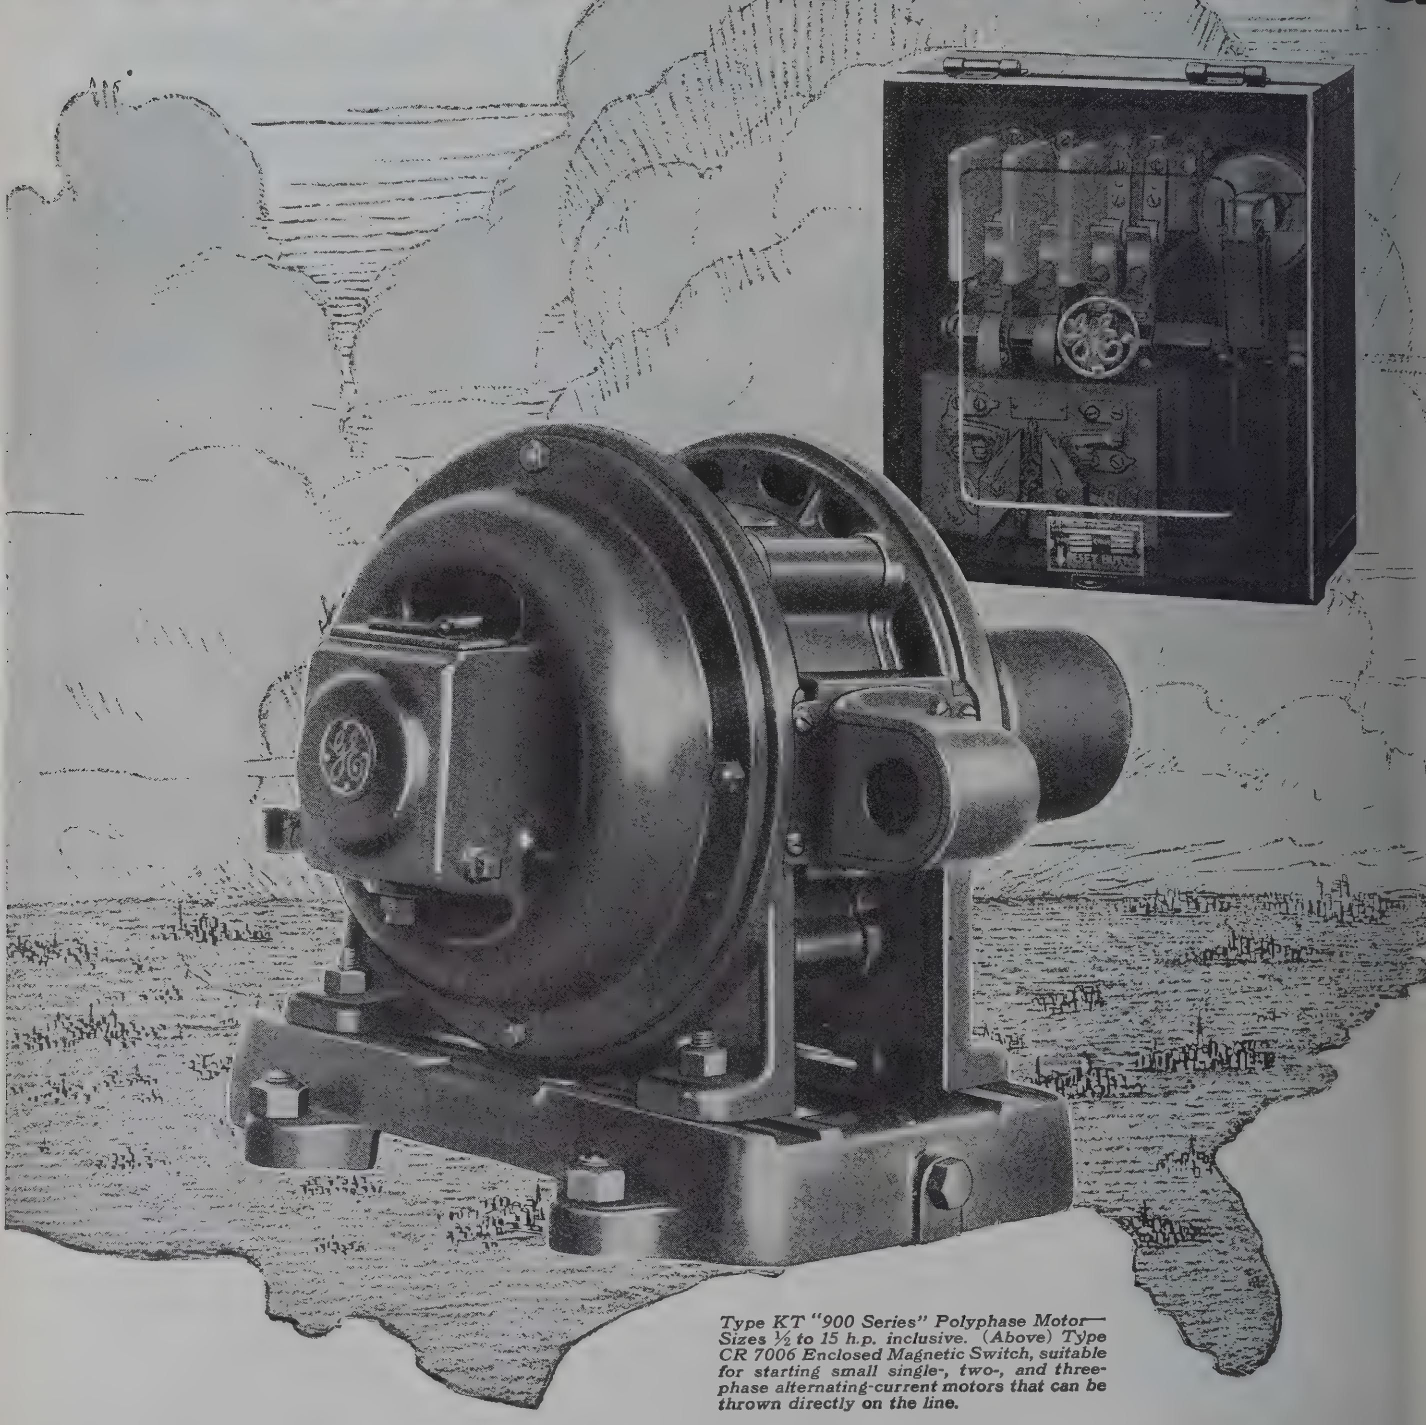
A Nation's Standard



Type KT "900 Series" Polyphase Motor—Sizes ½ to 15 h.p. inclusive. (Above) Type CR 7006 Enclosed Magnetic Switch, suitable for starting small single-, two-, and three-phase alternating-current motors that can be thrown directly on the line.

GENERAL

GENERAL ELECTRIC COMPANY, SCHENECTADY, NEW YORK

-E Motorized Power

Four improved motors for general industrial uses

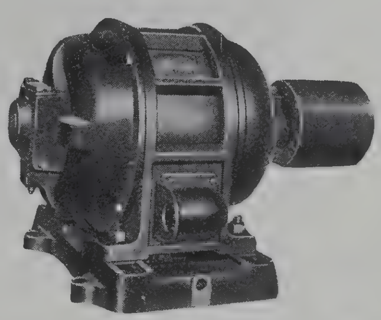
When you specify G-E Motorized Power, G-E specialists will study your electric drive problem—they will recommend the form of drive best suited, select the proper motor or motors from the extensive G-E line, include the suitable control equipment, and then see that the installation is satisfactorily made and serviced.

Whatever the circuit requirements or demands of service may be—whether the work be ordinary or extraordinary—whether you need a 1/200 h.p. motor or a giant of 22,000 h.p.—there is a G-E Motor to fit your need.

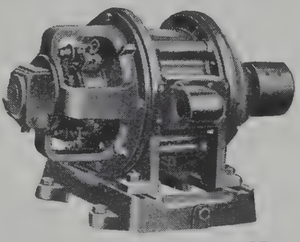
And for every G-E Motor there is suitable G-E control equipment—whether the requirements for starting, stopping, reversing, or motor speed regulation be simple or complex.

G-E Motorized Power is a practical means of increasing the productive ability and capacity of available man-power. "Built in" or connected to all types of industrial machines, G-E Motorized Power provides lasting assurance that you have purchased the best.

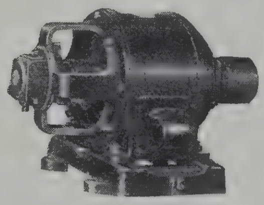
To obtain full value from your investments in electric motor drive, ask your nearest G-E office—or G-E Motor Dealer.



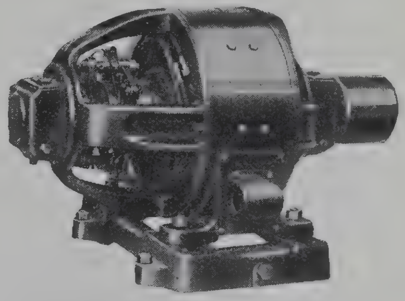
Type KT "500 Series" Induction Motor —Sizes 10 to 200 h.p. inclusive



Type SCR Single Phase Motor —Sizes ¼ to 10 h.p. inclusive



Type BD Direct Current Motor —sizes ½ to 3 h.p. inclusive



Type CD Direct Current Motor —Sizes 3 to 200 h.p. inclusive

Attention-Getting Displays—Nothing Les

"Get 'Em Up To Your Booth if You Want to Sell 'Em." How Our Firm Makes Good Use of the Fair Exhibit Space

By A. E. RICHARDSON*

IF THERE is any good reason for manufacturers and distributors of food products, household appliances, gas and electric equipment, and a thousand and one other businesses, to participate in food fairs, health expositions, industrial exhibitions, etc., surely the milk industry should also be represented. The fair, as a meeting place for buyer and seller, has existed for centuries. The bazaar, which antedated the fair, is the earliest known method of merchandising.

To purchase space and install an attractive exhibit for a display of a week or a fortnight, is expensive, nevertheless many of our shrewdest merchandisers continue to participate in these shows year after year. They must obtain results or they would not continue to make the investment.

Whiting Milk Companies exhibit in practically all of these exhibitions held in Boston. It gives them an opportunity to meet a great many of their customers as well as prospective customers, under most favorable conditions, and affords them an occasion to demonstrate their products and distribute samples.

Keen competition for attention always exists among exhibitors at these fairs. Each exhibitor strives mightily to attract the public to his particular booth. At a recent food fair held in Boston, Whiting Milk Companies succeeded in making their exhibit unusually distinctive through the introduction of a rather novel program. They displayed at their booth an attractive little house, freshly painted white, with green blinds, red chimney, etc. This miniature home was called "The House of Health." The entrance to the home was in the shape of a milk bottle with an attractive little door. Over the door was the inscription, "The Door to Health." This little door was fastened with a padlock. Thousands of little keys attached to cards were distributed to visitors to the show each day. On the cards were printed invitations to visit "The House of Health" displayed at the Whiting Milk Exhibit (giving the space number and directions), to see if the key attached to the card would unlock the "Door to Health." Each day several master keys were included among those distributed. Throngs eagerly gathered around the booth to find out wh
or not they were holders of the lucky key. The f
nate ones were awarded a prize of a quart of Grade
milk a day delivered to their home free for one week
Whiting booth was constantly surrounded with visi
Mechanical exhibits that told the story of Whiting
vice were among other exhibits that held the intere
the visitors.

At another show a large glass jar was displaye
the corner of the Whiting booth. It was filled
Grade "A" milk caps and seals. The public was in
to guess the number of caps in the jar. The lucky pe
guessing the nearest to the correct number was awa
a quart of Grade "A" milk a day for one month
second prize was a quart for two weeks, and the
prize a quart for one week. A splendid list of pros
was obtained as a result of this novel and inexpe
idea. Display cards referred to the guessing co
and reminded the public that there was no guess-
concerned with the production, processing and han
of Whiting's Grade "A" milk. Other cards and
tures gave detailed information regarding both G
"A" milk and other products.

Mechanical displays always command attention
add much to the effectiveness of an exhibit. Suc
least, is the experience of Whiting Milk Compa
Perhaps the most popular novelty ever distribute
our company in connection with their show and ex
tion displays was a little cowbell attached by a ri
to a celluloid button, on which the company's adve
ment appeared. One of these little souvenirs was g
to everybody making a purchase at the booth. Thi
only resulted in stimulating sales, but the tinkle, t
of the bells spread our advertising throughout the
bition hall, on street cars, and in the home.

The big job in connection with this form of adve
ing begins after the space has been purchased and
exhibit installed. The fair management only u
takes to provide the attendance; in other words,
circulation is assured. But to get your share of th
tention of the visitors in order to put over your
message, means that you must provide an attention
ing display and an interesting exhibit. Nothing le

The Why of Credit Losses and a Reme

A Common Sense Approach to the Problem for the Milk Dealer. Day to Day Check-up Necessary and it Must be Thorough

By E. J. CLARY

THERE is no easy and royal road to collections for the milk retailer, though many dealers are ready to try out numerous schemes and systems for getting magical results in this connection. But you can't beat the collection proposition with a system any more than you can, with certainty, break the bank at Monte Carlo with one. It is possible, however, to approach this problem in milk distributon with common sense and, while the results will not be magical, they will be satisfactory.

By common sense approach, I mean a solution of past due account problems in the light of practical experience. And experience has taught the milk dealer that out of every hundred accounts he takes on his books, a certain percentage will prove to be either costly to collect from or will not pay up at all.

The custom in most cases is to close the door after the horse has been stolen—whereas common sense will tell the dealer to close the door before the horse can be stolen. But how many in the milk trade do it?

There are two ways of spending money on credit protection:

(a) Investment of time and money that will sift out every applicant for credit before it is given.

(b) Investment of time and money in trying to collect accounts from people who can't or won't pay.

The second method is the common sense one.

The writer has made a study of retail credits for many years and has been surprised recently to learn the conditions as they exist on the books of the average milk retailer. Perhaps there is a reason for the loose method by which the milk trade extends credits, but I can't see that there is no more reason for it than there is for the butcher or the grocer. The milk dealer is extremely lenient in the matter of credit extension, even when quantity buyers are concerned.

How can the losses suffered by the trade in this connection be reduced?

By applying certain common sense principles which I have found to exist in one of the leading plants of the country.

Greater Value of Good Accounts.

The sifting of applicants for credit, especially in connection with the restaurant, bakery, hotel and club trade, the milkman should consider in the light of practical experience. Mere sales volume is meaningless when you achieve it at the cost of heavy losses in bad credit risks.

Even in the retail domestic trade, the milk plants in the East are giving more attention to their credit extensions, each applicant being required to prove that he or she deserves credit before it is given.

A common sense view of this part of milk plant management calls not only for a more careful sifting of credit customers but also a practical follow-up that will meet with the conditions as they really exist.

There are said to be over 50 causes for delinquency in the domestic retail trade which means that it is pretty hard to work a "system" on any given lot of milk plant
customers who are in arrears. There is a very grea
ference between the tactics needed to collect fro
home that won't pay, and the home that can't pay
for this reason common sense demands that colle
work on the part of the milk dealer be placed u
more individual basis.

Of course, the milk plant has collection facilitie
common among retail merchants in its route men
are able to keep a watchful eye on accounts, thoug
is not a final solution of the matter by any means;
men are not effective collectors and most of the p
disregard their usefulness in this respect.

And while the route man cannot be asked to
the matter of delinquencies in the full sense of the
he certainly offers the plant a safeguard as to its c
when they become long overdue.

One large Eastern milk dealer makes collection a
sonal matter, the route man merely reports on each
when it becomes delinquent, with any comment he
have to make as a result of his personal contact. C
tions are then made by the office man, or by a sal
collector.

Where Most Losses Occur.

Milk plants lose most of the money that they d
through bad credit risks as a result of certain c
which are eliminated by adopting a common sense
point of the matter:

I. Tendency to let accounts become inactive.

II. Failure to set time limits to accounts and
strictly by them.

III. Extension of credit without reasonable inve
tion of the applicant's ability to pay.

It has been the experience of credit men that
business such as the milk trade, where there are
small accounts to be followed up and where there
daily sale unit, the ratio of bad risks increases wit
element of time, that is, a milk account that runs be
the 60 day period is a poorer risk than a clothing ac
that might run beyond that period.

For this reason the persistent pushing of delinq
is necessary.

Most milk dealers suffer a greater percentage of
through their dealings in the commercial field as ag
domestic business, and the commercial accounts ar
easiest to check up from the standpoint of credit r
It would appear from this that carelessness in cred
tension is largely to blame, since the dealer can
line on any druggist, restaurant or hotel that wish
open an account with him.

It is a good point in handling milk plant accou
extend credit only as a privilege to the customer, a
make this plain at the time that the courtesy is exte
The plant must stand the cost of exending this pri
to customers and when business is done on this ba
the beginning the milk dealer has a stronger case
he finds it necessary to demand a settlement.

On every milk route there are customers who
lost their credit standing with local dealers and wh

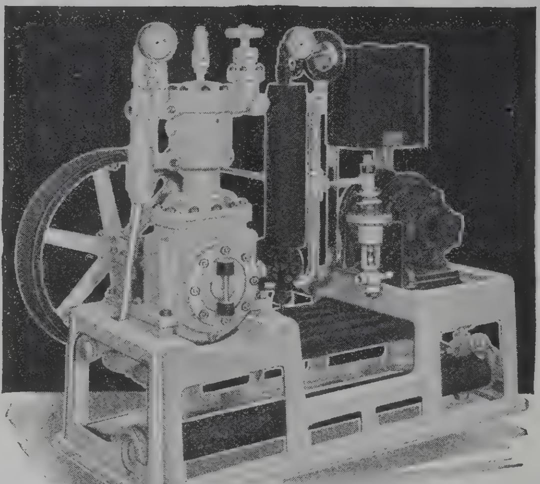
ROME
FULL AUTOMATIC REFRIGERATION



Installed Easily and Economically

A wise old Milk Dealer once said, "You can't beat our milk, BUT you CAN whip our cream."

Without doubt the above remark was made because the Milk Dealer had already installed a Mechanical Refrigerating Machine.

The ROME FULL AUTOMATIC is quickly, easily and economically installed and on such reasonable terms that no Milk Dealer need be without a Rome.

Rome Manufacturing Company
Refrigeration Dept. Rome N. Y., U. S. A.

compelled to do business on a cash basis, and people should be known to the plant. Trade associa are able to offer some help in this connection, whic management would do well to take advantage of.

Apply Common Sense.

The collection problem in the milk trade is j matter of applying common sense. Sift your credit tomers with reasonable care and follow them up r lessly. Don't let anybody get deep into your book fore you get the alarm. That's the way most losses o

There should be a day to day check up on the c tion of each account on the plant books, and re from drivers should be complete and regular. Don't tate to sut off service at a point where you conside matter risky. The attitude of the customer may h lot to do with the matter, as well as his ability to his obligation.

GROUP INSURANCE FOR ROSZELL EMPLOYE

The J. D. Roszell Company, ice cream manufact and milk distributors of Peoria, Ill., has adopted operative program providing more than $125,00 group life insurance for its employees. Besides th insurance, liberal weekly benefits are provided health and non-occupational accident policy. The is being underwritten by the Metropolitan Life I ance Company on a co-operative basis, whereby th ployer and employees contribute jointly tow premium payments.

Under this arrangement, each employee in the classification covered receives $1,000 of life insu at a low rate. In addition to this, health and acc benefits are payable for a maximum of thirteen secutive weeks. They amount to $10 a week, and payable when an employee is unable to work du sickness of any sort, or injury received off the job.

Besides the death benefits created for an emplo family or other dependents, the life insurance estab a temporary fixed income for the worker himself, in he becomes totally and permanently disabled befor age of 60. In such event, he will receive the full am of his life insurance in monthly installments.

The insurance company furnishes sick or dis employees insured under the plan, with the servic a staff of trained visiting nurses. Supplementing pamphlets on disease prevention and health cons tion periodically are distributed.

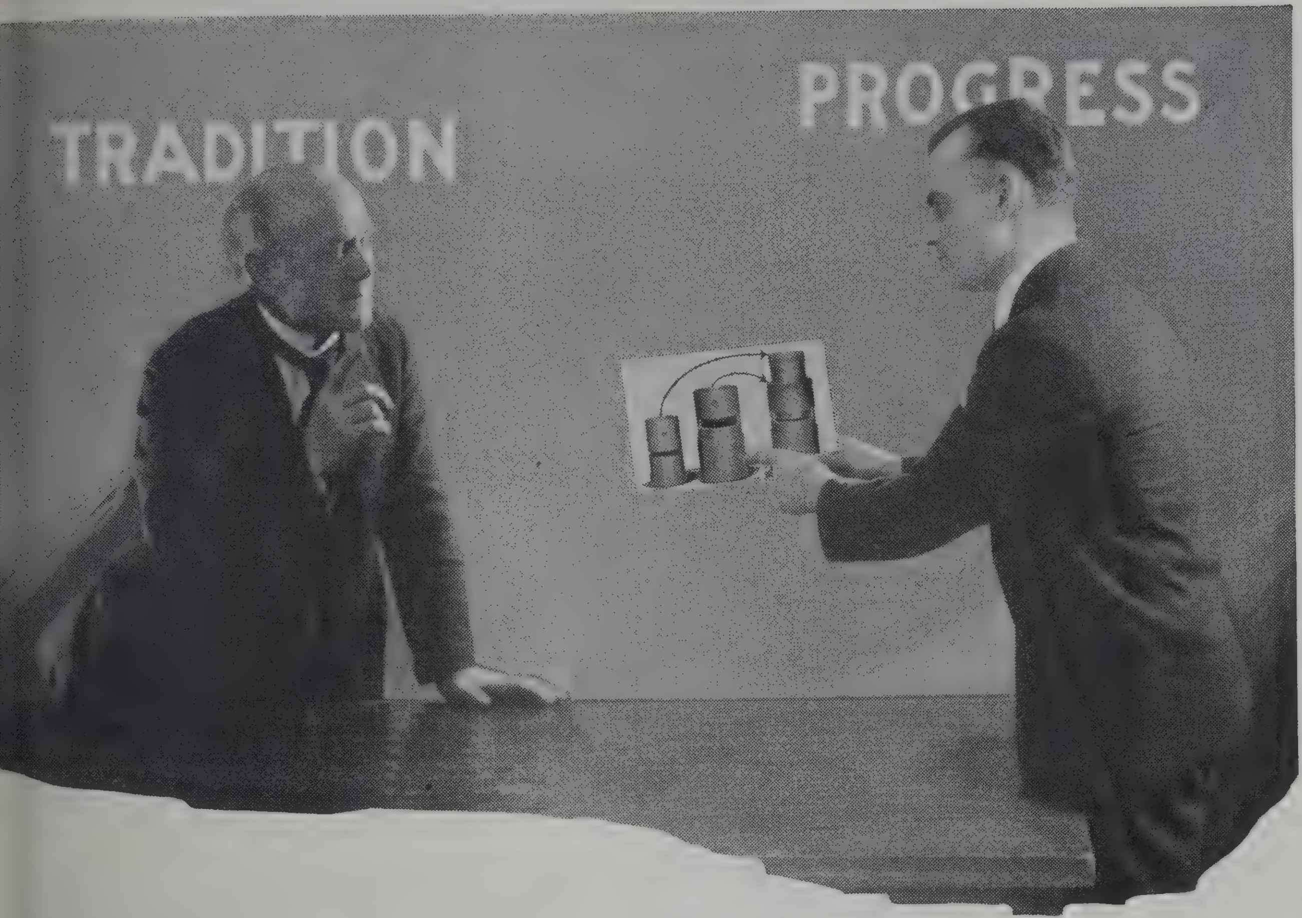
DEATH TAKES A. J. RYNER.

A. J. Ryner, part owner and manager of the Milk Products Company, Perry, Ia., died Februar 1927, at the age of 57 years.

At the time of his death Mr. Ryner was preside the two leading civic organizations of the city, the ufacturers' Association and the Perry Community He was also a member of the local Rotary Club.

Mr. Ryner was born in Peoria county, Illinoi his father's farm. His boyhood was spent in that tion. Later becoming connected with the Ame Telephone and Telegraph Company his home was cessively at Minneapolis, Chicago and Omaha. Pri his removal to Perry he was employed with that pany as an executive at the Omaha office. Since chasing the local plant Mr. Ryner has been the dent manager in charge, while his brother, half o in the plant, had charge of the sales and purchasing of the work.

is just getting his bearings



ook, Lad—

they tell me out in the shop that it t the motors that are bad, as *you* said, that the bearings cause all the trouble are having. Can't you get some better rings to save us all this repair expense?"

"No, Pop—

you're like the fellow who said that the egg wasn't bad—it was only the yolk that was just a lee-tle bit hatched.

Here's a picture I had taken, showing one of the bearings from the estimable motor you are standing up for.

See how nicely it fits down into the bearing from a LINC-WELD motor of the same rating. (Rating is a funny term . . . look into it.)

Those flapper size bearings that cause all the trouble have a bearing surface of about 4 square inches.

This amazon LINC-WELD bearing gives you 7¼ square inches.

You know that the bigger the bearing, the less the trouble.

You've fallen smack against the very reason why I told you to forget your old crony motor salesman. That friendship doesn't extend as far as motor operation."

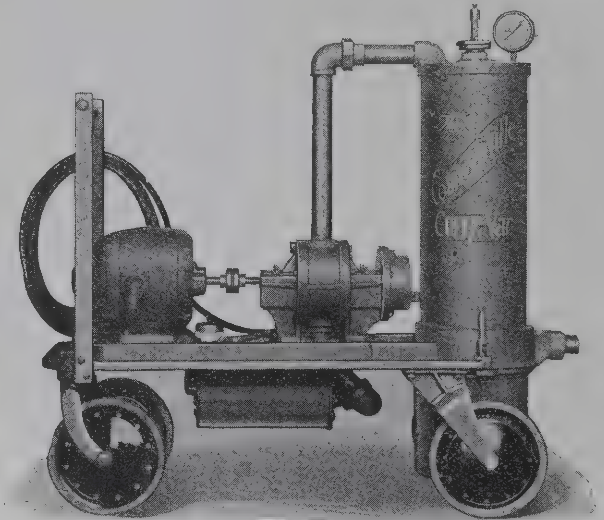
Saves Time!

With a Connersville Curry-Vac, cleaning time can be reduced almost 50%. The time saving in machines over hand currying is practically the same whether cleaning horses or cows. Time saved is labor saved. Labor saved is money made.



Connersville Curry-Vac

Increases Production

Cows that are regularly cleaned by Curry-Vacs produce more and better milk than they do when hand cleaned. The massaging effect of the vacuum tool, and the thoroughly clean skin with open pores are the causes of the increased production.

Reduces Bacteria

Connersville Curry-Vacs greatly reduce the bacterial count of milk. By removing all the dirt, keeping the cows' skin clean and eliminating dust which is such a nuisance in hand currying.

DATES SET FOR PACIFIC SLOPE SHOW

Following a meeting of the Pacific Slope Show's executive committee at Oakland, Secretary ager Robert E. Jones announced that dates had be cided upon for the seventh annual exposition to b at Oakland. The event is scheduled for November 19, 1927. This is the fifth consecutive year for the Slope Dairy Show in Oakland, where permanent quarters are located at 1404 Franklin St.

Two new members sat with the show executive mittee for the first time. They were C. O. Hagen Angeles and A. J. Cowell of San Francisco. Dr. Roadhouse, president of the association and head dairy industry division of the University of Cali at Davis, presided. Oather members of the commit attendance were E. A. Green, C. E. Gray, J. J. O'N H. Greene, Geo. W. Prising and Robert E. Jones.

Prior to the meeting, the show executive com was entertained at luncheon in the Athens Club by bers of the Alameda County Milk Dealers' Associ Dr. C. C. Wing; head of the Oakland milk inspecti partment, was the principal speaker at the lun

Dr. Wing brought out the remarkable fact t ten years the consumption of milk in the East Ba increased from 17,600 gallons daily to more than gallons daily. Thus the increase in milk consun has been greater than the increase in population, cating a larger per capita consumption than in He attributed much of the increase to improvem quality of the product.

ANYTHING FROM SOUP TO NUTS.

According to D. W. Ashcraft, of the College of inary Medicine, at the Ohio State University, a by-products may mean anything from the milk we to the buttons we wear on our clothes.

A large number of the by-products form a nec part of human diet. Milk, butter, and cheese a amples. Casein, a protein product obtained from milk, has extensive and varied uses. We use abo million pounds of casein a year. Two-thirds o amount is imported from other countries.

Casein has been used in finishing the heavier, grades of paper used in books, magazines, and th Mixed with lime-water, casein makes a substance t exceptionally resistant to water. During the war, was found to make the only glue or cement that stand up under the demands of the airplane.

This by-product of milk, Mr. Ashcraft obser also used in cold water paints and in printing wall The plastic materials used in making buckles, bu novelties, beads, fountain pens, and automatic p originate in casein.

GOATS GIVE 10 QUARTS 11 OUNCES OF M DAILY.

J. Merrell Kurtz, who owns a farm near Boston bought five Toggenberg milk goats and placed th his farm. Toggenberg goats have a record of giv high as 10 quarts 11 ounces of milk in one day.

Milk from this class of goats is now selling in ville at 50 cents a quart, according to Mr. Kurtz. terfat from this milk runs from 8 to 10 per cent. goats were first imported to the United States Toggenberg, Switzerland, in 1904. Thirty thous these goats are now being milked daily in Californ

HAUL MORE FOR LESS MONEY

What's in a Bottle of Milk?

A Bottle of Milk is a Bottle of Milk, but When Analyzed for Its Human Benefits It's a Bottle of Milk Plus

WHAT is milk? It is action. It is achievement. It is the force behind great undertakings. It is the keynote of great industry—the power behind the machines. It is the dynamic charge that sets off human vigor and vitality.

The scientists can give you many statements regarding the component parts of milk, but those interested in the science of marketing milk will do well to put this analysis in a popular language, in an appealing language.

Lime? Every man and woman can remember how boresome was the study of lime in physiology while in grammar school. Yet we are forever talking about lime, lime, lime. Why not talk about what it is?

Lime is health, beauty, personality. It is one of the contributing factors to that mental state which a great authoress has called "It." Lime makes for fine, pearly teeth, the kind wanted by every woman who wants to be beautiful, and by every sensible man who recognizes the importance of good teeth to health. It makes for good, clear complexion, the wish of every daughter of Eve.

"Vitamines!" we shriek at the top of our voices, and the chances are we go over the heads of a great number of people, while on the other hand there are thousands of people who know in a general way what vitamines are, but can't picture them clearly. Vitamines, we know, are those invisible forces in food that make for life—Vitamine A has its office, and Vitamine B its office, and Vitamine C still another purpose. Let's bring out these purposes, these acts—not just their catalog serial numbers.

There are two things about human beings every merchandiser should know. First, they haven't much imagination and, on the whole, don't do much thinking—not much thinking for themselves, that is. True, man is a political animal, with associating instincts, but in many ways his mind still is on the order of the lower kingdom—he permits other people to do his thinking.

Second, the average human being can't see the picture unless you present it to him so graphically, so clearly, so strongly, so convincingly that it almost knocks his hat off.

Talk to him until you are blue in the face about the component parts of milk and the average man will be like the Indian in Oklahoma who made a lot of money out of oil and was asking an auto salesman to give him a demonstration. After two or three hours of careful explaining about the inner workings of a flivver's motor, the Indian nodded gravely and said, "I see, but what makes it go?"

We must show the public what makes milk go! We must show the public how and why it is a source of energy, power, magnetism.

There is much about personal magnetism in the magazines these days. We go to far lengths in this day and time in quest of that mystic, elusive strand of life that makes for—what? Some of us think it is for wealth and position that we are seeking. But the basic thought behind our actions is something else. It is one of the saddest commentaries of life that so few of them know what that Something Else is.

In a popular book now out a woman author calls that Something Else "It." This "It" is what men have
when they are masterful, convincing, swaying, lea
directing, controlling. "It" is supposed to be the c
of manner that makes and holds friends, the dign
easy use of power that controls the actions and tho
of others, the intangible quality that makes other
things we do. In other words, "It" represents per
magnetism, human attraction.

It would be impossible to enumerate the vast nu
of hokus-pokus medicine men of modern society wh
making much money by telling foolish human b
how to acquire power.

Few of them know that what they want, what
seek, is to be obtained in a simpler and more direct
ner. Few know that the great Something Else of
in a bottle of milk.

Health is the foundation of true achievement.
we can trace back through the pages of history and
how many of the great creators of the world's m
pieces were invalids, were sick men and women,
afflicted in many ways. Many of them dissipated,
no attention to the laws and rules of life.

We must consider, however, that these men,
the inspiration of genius, succeeded despite thems
with great wills that rose above their afflictions, th
ural as well as those self-imposed.

The men at the head of great movements toda
forceful men, convincing men, men who are alive
alert, enthusiastic, filled with confidence in thems
faith in their works and conscious of their abilities

The man who is going to cause the world to
more milk is the man who best succeeds in draw
picture of milk as Force, as Power, as the intan
energy that explodes all the creating influences
man's nature.

Remember that. We can go a long way in ta
about milk without getting any further from that
It is the basic point.

Let us keep in mind that milk is the creator o
great Something Else in life, the intangible some
that is missing from the makeup of most of us.
is? All of the wise men of all the ages may debat
point, but we frankly don't know for sure. Wha
it is, however, we are convinced it is the great cont
ing factor to what we all want—happiness!

Milk, then, the builder of health and happiness
make out a pretty good case for itself as the great
thing Else.

Milk is "It."

Over 500 Dairies are using

KOKO-MALT

It's Making a Big Hit !

for their

Chocolate Malted Milk Drinks

HERE is a new product which is blended from a special Dutch-processed, double milled cocoa and pure barley malt extract with special flavoring to intensify the full chocolate flavor and absorb the bitterness of cocoa.

DAIRIES bottling chocolate milk should be interested in this new preparation. It means a great saving in your syrup purchases. The cost of one gallon of delicious chocolate malted syrup made from KoKo-Malt, which is sufficient to flavor 10 gallons of milk, is 75 cents.

We will be glad to send a sample of KoKo-Malt sufficient to make one gallon of syrup to those interested in this new hit.

Unsurpassed

in ability to give Long Service

SINCE Woolsey pioneered the interlocking metal corner with wire laced unit slat construction, where has there been any greater improvement made in milk bottle crate construction?

Service and the economy that results from long service are the only things that have placed the Woolsey crate in so many prosperous milk plants today.

The milk plant operator who has not given the Woolsey wire laced bottle crate a thoro trial in actual service on his wagons is cheating himself out of a good many dollars of profit yearly.

If the Woolsey Principle of corner construction and bottom protection were wrong, there would not be such wide imitation of these features. Imitations at best are only makeshifts. The long service lies not in the metal at the corner, but how this metal corner is made and in the WIRE LACE which makes the Woolsey Crate the only FLEXIBLE CRATE able to absorb shock and arrest its transmission to the bottles in the crate.

Send an order today and prove to yourself the dollars that Woolsey Crates will save through longer service.

utmost in Sanitation!

No Solder—Stronger than Steel—Lighter in Weight and Seamless

NICKEL is the cleanest and most ideal metal container for goods and dairy products of all kinds. The purity of 99% Nickel renders it absolutely impervious to corrosion, a metal that will withstand wear and abuse far beyond the life of equipment now in use.

By our ingenious method of casting joints, 99% Pure Nickel Sheets are joined into containers of almost any size and shape. When ground and finished, the article is seamless and equally strong throughout its entire surface.

This ideal construction aids sanitation and ease of cleaning and eliminates the use of solder entirely. You will never need to refinish the containers, 99% Solid Nickel being used for all our equipment.

We are now in position to supply you with 99% Pure Nickel equipment from the smallest food utensil to the largest milk tank. Our engineering department will be glad to analyze your particular requirements, anytime.

ar Sir:—I have been interested in your development question concerning the use of gelatine in buttermilk ppears on page thirty-six of your February issue, (Vol- 6, Number 5) which was built around a circular issued s bureau and published in your January issue, and later uted with a circular to health officials. Personally, my on to all such proposals is this; Show me first that you pport your claims for improvement, not by testimonials, y actual demonstrations. If then you can further show at in accomplishing these, other advantages which we njoy will not thereby be sacrificed, then I am willing dorse your proposition and to recommend changes in es which will permit its adoption.

e must recognize that in response to a questionnaire casted to secure opinions on a question of this character formation which is received represents merely the pres- action of those who reply, rather than mature opinion on thorough consideration of well founded scientific

rankly, my first reaction to this specific question of the f gelatine in buttermilk is this: Are those promoting the principally concerned in the sale of gelatine or in the vement of cultured or artificial buttermilk? This much now, that cultured buttermik properly made from the sort of materials is a most excellent product and does equire the use of gelatine in order to prevent wheying hich seems to be the principal difficulty that can be over- by adding gelatine and is the principal reason that un- d manufacturers of the product become interested in its In other words, by using gelatine less skill is required ake cultured buttermilk that will get by. Also, poor ials can be used and still make a marketable or pre- ble product.

hen the question is presented to health authorities it is er set of arguments which are called upon to put the across. In this case it is the food value of gelatine which essed. No one doubts that good gelatine is a good food, he amount of gelatine that is required to be added in to give buttermilk of poor quality the consistence and ing" quality of buttermilk of good quality is so small it does not deserve serious consideration.

hese impressions are still uppermost in my mind and they have been dispelled by appropriate demonstrations will withstand the test of scientific scrutiny I, for one, be unwilling to endorse any move to modify our present ations which prohibit the use of gelatine in buttermilk, would serve only to mask defects in this most excel- ood.

Very truly yours,
(Signed) J. J. FREY,
Chief, Bureau of Dairy Control.

ARENTS SELECT COWS WHOSE MILK IS RESERVED FOR BABIES.

een Mary has personally selected the cows that are pply Her Baby Highness Princess Elizabeth with The campaign against tuberculosis is being tack- nost scientifically and not only are all the farm als subjected to strict inspection periodically, but, special precaution, selected cows are kept apart their companions in sequestered fields. They are prize animals and the farmers often find it quite od advertisement to allow parents to select the in- ual animal whose milk will be reserved for their ts upon payment of a fixed fee.

Friendly Talks on the Important Subject of Sterilization

Conducted by
J. W. YATES
formerly Dairy & Food Commissioner, Health Dept., Kansas City, Mo.

Talk No. 6

Chemical Sterilization of Utensils at the Farm Cheaper and More Practical Than Any Effective Heat Method.

The greatest source of bacterial infection in fresh milk is the utensils, equipment and containers used AT THE FARM. Bacteria is the greatest influencing factor of quality in milk or milk products. It is practically impossible to deliver a can from the milk plant that will be in fit condition to receive milk AT THE FARM. *The bacteria that survive the cleaning process at the plant, grow to uncountable numbers before the can is used AT THE FARM.*

It is essential that the bacteria be eliminated if good quality milk is to be obtained. Heat methods are expensive and consume more time than the producer can afford to give. With kerosene at 16c a gallon, it costs more than 7c to heat 10 gallons of water from 60° F. to 160° F., and this is the **minimum** volume of **water** and the **minimum temperature** that can be effectively used.

One tablespoonful of B-K added to 1 gallon of water of any temperature is more effective as a sterilizing agent. This costs but one and one-eighth cents per milking. It is used simply as a final rinse, making contact with all surfaces that the milk touches. With less than 1% of the dairy farms in the United States equipped for heat methods of sterilization, B-K provides a readily acceptable method that farmers may use when they will not use anything else.

Write me:

(1) your personal problems. Every plant or factory has its own particular sanitary problems I will be glad to give you the benefit of my years of experience.
(2) for plan of promoting better care of milk AT THE FARM, where it is produced.

J. W. Yates.
Consultant in Sanitation.

Rosy Cheeks and Happy Voices

Health Workers in Wisconsin Put on Follow Up Campaign to Revive Interest in the Big Milk Advertising Campaign of Four Years Ago. Best Results is in Improved Health of Children

By NELLIE KEDZIE JONES*

DURING the week of February 14-19, Miss Mary Brady, the nutrition specialist in Milwaukee county, assisted by Miss Gladys Stillman, the milk specialist of the home economies extension department of the college of agriculture in Madison, Wis., staged a "follow-up milk campaign" in Milwaukee and Milwaukee county. This was designed to revive the interest aroused in a milk campaign carried on some four years ago.

As a result of the first campaign, many schools have found it to their great advantage to serve to the children sometime in the forenoon, a bottle of milk which, taken through a straw and with a graham cracker, made not only good nourishment for the children, but a sort of picnic as well. Every child looked forward to the milk hour as a diversion and the consequence was that many children who, before that time, had not been willing to drink milk, were eager to get the bottle of milk and the straw which made a new experience in the middle of the school forenoon.

This follow-up milk campaign last month was carried on in a little different manner from the first one. During the first campaign, every school in the city and county was visited by a speaker. This year, instead of having the speakers go to every school, Miss Brady and Miss Stillman visited each school principal and arranged for the distribution among the children of many of the grades, blotters which reminded the children that they ought to drink enough milk for health. This pretty blotter carrying the happy boy face and his bottle of milk made every child think about drinking milk when he got home. Sixty-five thousand of these blotters found their way into the hands of the children. Pamphlets, plays and stories suitable for use in the various grades were left for the teachers who will use them as occasion permits. The teachers are happy to co-operate in all this work. The children were invited to enter a milk song contest and some of them sent in very clever little "poems." Ribbons were awarded for the two best poems in each school. These are some of the verses written by small children:

"I like milk and milk likes me,
I'll not quit the cow till the cow quits me."

Another verse runs:

"Milk is to the body what gas is to the car,
If you don't drink it, you will not run far."

Another:

"The milk I drank for supper
Is the milk that gives me thought.
When I get to school in the morning,
I am ready to be taught."

There may be some question as to poetic value, but there are wholesome suggestions to the child who repeats these jingles.

In the very early grades the Milk Fairy story and sometimes a little play were given in all the schools. The third and fourth grades had "Mother Goose Land Stories" and usually some suitable play. The fifth sixth grades also had stories and plays, while the enth and eighth grades an especial play called "M on Trial" was put on. The "Mother Goose Reel" shown in many of the schools and this reel being adap from Mother Goose stories which emphasize the use milk, was of great value in arousing interest in plays. The stories and plays, poems and songs wh were used in the schools come from the home econon extension department at Madison and may be secu by teachers from the office of Miss Mary Brady, nu tion specialist in Milwaukee.

In addition to the material given to the schools the talks given in schools, the two nutrition speciali Miss Mary Brady and Miss Gladys Stillman, spoke fore more than one hundred organizations of women, cluding parent-teacher associations, women's clubs, societies, etc. They also visited several of the noon clubs and spoke to the men, urging that both men women see to it that the children in their homes h sufficient milk for health. Through the co-operation the junior chamber of commerce, several fine wind displays were put up in the business section of Milw kee. It was a bit unusual to see cows gazing from plate glass window of a great retail store. It might startling, but almost everybody stopped to read legends which were put beside the cows in the wind and certainly everyone who saw and read, went ho feeling that he had seen an unusual sight and was minded of the value of milk as a food.

The children in the lower grades were given butt to wear and every child who wore the button show the bottle of milk and the legend "Milk for Health" more inclined to drink his milk when mother put it the table. The hotels and restaurants were co-operat in their use of the labels which were sent them and th labels were suggestive, as they showed the happy fa boy on the blue background, bringing to the notice every observer the bottle of milk.

All this means that more people are hearing about value of milk as food and are using more milk in th homes than ever before. When women come to particularly what they can do to get a child to dr milk, when a mother comes and says, "My little gir underweight, but she doesn't like milk. How can I her to take it?" Then the nutrition specialists are their glory, for they have many suggestions to make through their suggestions many children are conver to the idea of eating or drinking more milk. The ch who perhaps cannot drink enough milk to keep him good health can often eat the foods made with milk.

Whatever else is accomplished by these milk c paigns, the very best result is seen in the improved hea of school children. Rosy cheeks, happy voices, bet lessons, more work, and in the years to come, bet citizens because of better bodily health during childho

We are told that "health is wealth." Increased of our state's best product, milk, means greater st wide wealth.

---

* State leader, home economics extension, college of agriculture, University of Wisconsin, Madison, Wis.

Tycos

WITH THE BENEFIT OF PUBLIC APPROVAL

Just a Few Plain Facts

NO enterprise—or the product of its effort—can long survive without the benefit of public approval.

The instruments known by the identifying name of *Tycos* Instruments for indicating, recording, and controlling temperature in all its varied applications, industrial and domestic—have been manufactured by the *Taylor Instrument Companies* for seventy-five years.

The consistently increasing demand for these instruments, now numbering more than 8,000 distinct units for industrial and home use, is proof positive that they have the fullest endorsement of public approval.

To indicate and control record temperature honestly, faithfully, and with scientific accuracy is the chief function of all *Taylor* Instruments, from the humblest home thermometer to the most delicately calibrated industrial calorimeter.

The same policy of honesty is translated into our relations with our customers, in a sincere endeavor to serve you faithfully and well.

There is a *Tycos* Temperature Instrument for every purpose. Tell us your need, and we will send you full information—and our Catalog.

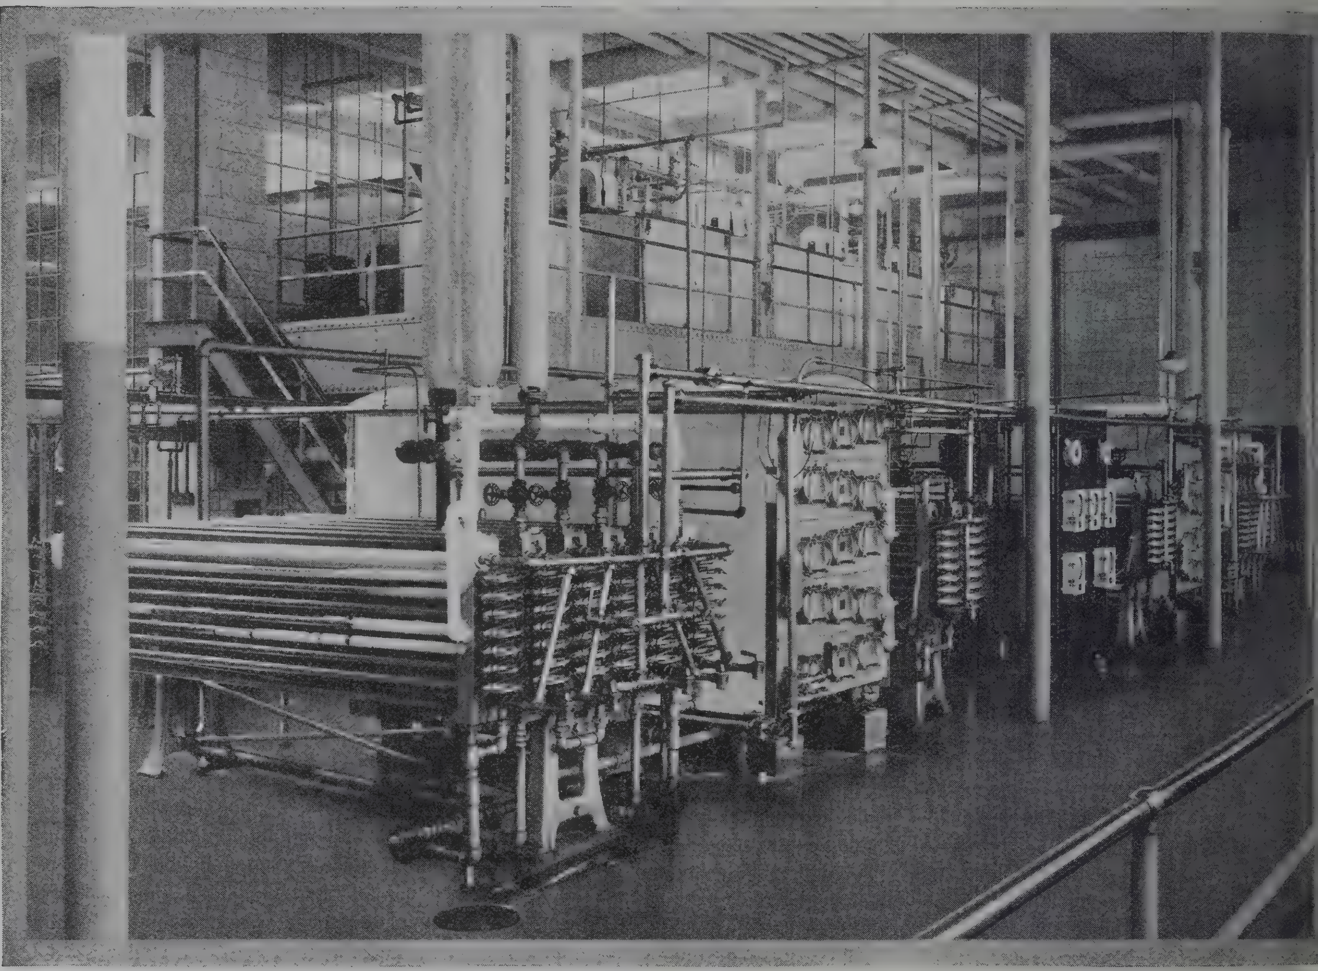
Barber Goodhue

Everything for the Dairy Industry



Burrell Simplex Tubular Pasteurizing System

THE complete Burrell System is composed of three units—(1) Simplex Internal Tube section for heating, (2) Simplex continuous flow pasteurizer or holder, (3) Simplex Internal Tube sections for cooling.

The Internal Tube heating and cooling sections do away with the need of special cooling rooms. They protect milk flavors because there is no possibility of leakage of water or brine into the milk. They prevent loss by evaporation. They provide rapid heating and cooling, without excessive agitation of the milk, so important to its proper handling and creaming ability. Easily and quickly sterilized.

The pasteurizer unit, operating on the continuous flow principle, is entirely free from valves and pockets. Proper temperatures are accurately maintained and every particle of milk is held for exactly the right length of time.

Both holders and cooling and heating units are built in sections so that the system can be expanded by simply adding additional units.

We should be glad to discuss with you, without obligation, your pasteurizing needs and to recommend the kind of equipment that will best meet your requirements.

FRED WEHMILLER.

Fred Wehmiller was born in St. Louis on November 10, 1873.

The only son and youngest child of John Henry Wehmiller (engaged in the flour brokerage business) and his wife Henrietta (nee Jebker), was educated in the public schools and the Manual Training School of St. Louis.

In 1891 he became assistant surveyor for the Terminal R. R. Co. in connection with the construction of the Merchant's bridge, and remained with that company until 1894. He then secured a position as draftsman for Essmueller & Barry, and a change in the organization in 1897 led to the adoption of the firm style of the Barry-Wehmiller Machinery Co. Mr. Wehmiller became the secretary thereof and continued so until 1903 when he was elected president and treasurer.

FRED WEHMILLER.

Mr. Wehmiller was also vice-consul for Brazil in St. Louis.

In May, 1905, Mr. Wehmiller was married to Miss Lillie Widman, who was a daughter of the late Fred Widman, a prominent architect of St. Louis. Their children are Dorothy, Frederick W. and Paul K.

He was well known in Masonic circles, belonging to the Scottish Rite bodies and Moolah Temple of the Mystic Shrine, and was also a member of the Liederkranz Club and the Cedar Crest Country Club, as well as the National Playground Assn.

⁂

A COMPLIMENT TO THE BORDEN MILK COMPANY.

Geo. W. Marble, the editor of the Fort Scott (Kans.) Tribune-Monitor, in speaking of The Borden Milk Co., which recently established a branch in Lewisburg, Tenn., said in part as follows:

"Permit me to say that I could conceive of no greater good fortune to an agricultural community than to have the Borden Company become interested in it to the extent of establishing one of its manufacturing plants there. The Borden Company not only has the facilities and the markets for development of a big industry at Lewisburg, but you will find it to have a soul. It will take into account both sides of the milk production business and will have regard for all the obstacles and handicaps of the producer of raw materials and help to solve them. Milk is becoming one of the great industries of the country. Milk consumption is increasing at an enormous rate. There is no top to the market the Borden Company provides for a community in which it locates.

⁂

DRINK MILK AND MORE MILK FOR BEAUTY.

Dr. Henry J. Schireson, famous Chicago dermatologist and facial plastic surgeon, who has won fame by beautifying motion picture, musical comedy and vaudeville stars, has one infallible prescription for the at ment of beauty. It is: "One quart of milk a day hour of sunshine, and repeat adlibitum."

Dr. Schireson continues: "Beauty specialists cosmetic makers would be driven out of business few weeks if all the women of America would their quart of milk a day."

⁂

WHAT PERCENTAGE OF TOTAL CIRCULAT READ A GIVEN NEWSPAPER ADVERTISEME

By John T. Bartlett.

"No advertiser," says Rolland Hall, in his "Retail Advertising and Selling," "need deceive self into thinking that because he uses a newsp reaching from ten thousand to one hundred thou readers he has a good chance to interest all of readers, or even a large proportion of them. He most difficult undertaking to command and hold attention of even five or ten per cent, with an adve ment of ordinary size."

There is not enough visualization by retail a tisers of the problem of commanding and holding a tion of readers. This statement of Hall's—and ex enced advertising men will confirm it—clearly re that apart from the problem of persuasion, the adve has opportunity to increase wonderfully the effecti of his advertising.

Five and ten per cent of a two thousand circula such as dailies in small cities do not often exceed, i hundred or two hundred. Those percentages ap to five thousand give us two hundred and fifty and hundred. Even with a circulation of one hundred t and, the newspaper advertiser may not get his me read by more than eight hundred or one thousan best.

One of the soundest methods to increase percen of readers is building up a "following." The adve builds readers for his advertising in exactly the way that the newspaper builds readers and subsc for the entire publication—through giving the p that which causes it to "repeat."

Let a newspaper reader discover it is to his ad tage to read certain advertising regularly, and likely to do it. Every community has hundreds hundreds of housewives who will consistently follo vertising—and the advertising of any particular ness—if they believe it is to their interest to do so.

Well-written interesting copy, newsy copy, which arouse desire, build followings. It is when lar readers are added to chance readers of advert that the real results begin to stream in.

Special plans to draw attention are used. Big s naturally, is the simplest route to a righ percenta readers—but it is an expensive route.

Whether or not readers of a newspaper read it vertising, in an especially active manner, is highl portant. Advertisers in all fields continually con the experience of small circulation pulling far gr total results than large circulation. The explanati in "reader interest," as the publishers call it. A cation which is well-read with confidence by its rea pulls far greater results than the much larger circul of casual readers having no special attachment fo publication.

Always when an advertiser's insertions are not ducing results, one fact for him to ponder is the bility that very few are actually reading his copy. counts is not the total newspaper circulation, bu total number reading the advertising. Concent effort should be expended to increase this percenta

CONFIDENCE

Confidence in their own ability and the courage to try new methods has built many business successes.

So, likewise, with the "Wyandotte" method of dairy sanitation where once it was tried by the courageous few, it is now the method depended upon in thousands of dairies, creameries, and cheese factories.

They are finding the use of

Wyandotte
Dairyman's
Cleaner and Cleanser

not only productive of that sweet, wholesome, sanitary cleanliness which means quality insurance to valuable milk products, but which also is proving the most efficient and economical sanitation obtainable.

What Is Good Milk?

The Grading of Milk and the Control of City Milk Supplies. A Subject of Vital Interest to Milk Dealers Discussed by a Missouri Educator.

By PROF. WM. H. E. REID.*

THE regulation of public milk supplies was attempted long before sanitary science became established. The Senate of Vienna in the latter part of the 15th century forbade the sale of milk, butter, and cheese for a time on account of an epidemic which was believed to originate from dairy products. The city of Paris, in 1743, passed a milk ordinance which regulated the feeding of cows, goats, and asses. An attempt at hygienic milk production was made by John Peter Frank in the latter part of the 18th century, as is indicated by the following extract: ''Milk should not be handled in vessels of zinc, lead, copper, or brass. In Paris, where milk is handled in copper vessels, whole families have perished from poisoning with vertigris.'' The same author calls attention to the sanitary conditions in the cow stables, and quotes a case where a cow was bitten by a mad dog and as a result the farmer and his family contracted rabies. Another sign of progress came in the passing of a milk ordinance in Hamburg in 1818. Recently a great impetus was given dairy development in this country by Dr. Coit's plan for certified milk.

Milk control involves unique difficulties, as milk is usually consumed twenty-four to forty-eight hours after production, while meat and other foods are held for considerable periods. Therefore milk control must cover a large field of inquiry, and can be effective only in reference to general supplies, and not to individual cases. Inspection of milk supplies assumes special importance when it is considered that the bulk of the population cannot afford to purchase certified milk. Babies of the poorer classes of people must be fed on a milk costing a lesser price and there should be available another milk of a reliable quality.

To give consumers a choice of different grades of milk is a policy which shows the public that milk may differ in quality. This has been amply demonstrated in New York, where the different grades of milk have been sharply defined by the board of health. The regulations in force in New York City are concise and in many respects worthy of imitation.

The following extracts are taken from a paper on this subject, read at the forty-sixth annual congress of the Incorporated Sanitary Association of Scotland by Arthur Grofton, F. R. C. V. S., chief veterinary inspector of the city of Edinburgh. This paper, in part, lends principles and practices which are applicable to many communities in this country. Mr. Grofton saw various indications that the early introduction of the official system of grading of milk was seriously contemplated by the central health authorities and make the following observations on the subject:

''It would appear reasonable to suppose that the official grading of milk, if definitely decided upon, would be a matter of growth and development than of immediate general application. The official certification of the higher and better qualities, which are likely always to constitute a relatively small proportion of the total supplies, would be undertaken in the first instance, and w sufficient experience had accumulated the princ would be extended gradually to the other classes, p vided the value of the results achieved justified the c of securing them. Under any circumstances, it wo not be possible to make any system of grading wh might be devised generally operative immediately a its introduction. A lapse of time would be essential d ing which the information necessary to permit the gro ing of milk into the different categories would be ac mulated. A single test would not be a fair criterion the average qualities of milk derived from any sou and would neither justify inclusion in a particular ca gory nor exclusion from it. A fair and just estim could only be formed by a series of tests spread ove period of time. Nor could any system of grading gu antee that a particular milk would conform at all tin to a definitely specified standard. Only by check te repeated at relatively short intervals would it be po ble to obtain a degree of assurance that the requi standard was being maintained.''

''Milk may be graded on the basis of chemi composition, hygienic qualities or a combination each. A combination of the chemical and hygienic qu ities would constitute the only sound procedure. T official grading of milk could only justify itself p vided it proceeded along lines calculated to gain the c fidence of the consumer by conveying an assurance t the milk purchased was in a sound, wholesome conditi and possessed not less than a minimum nutrient value measured by a fixed chemical standard. It would a serve as a constant stimulus to the producer to aim maintaining and improving the quality of his prod by excluding from classification milk which did not c form to the minimum standards both nutrient a hygienic, and by conferring the right to demand a hig price which bore a distinct relationship to the standa of quality which he had succeeded in attaining.

''If the official grading of milk is to be undertaken is essential to realize the importance of grading on t double basis, no matter whether the principle is to applied generally or only to a limited extent. The ne for improvement in the hygienic quality of milk is mitted, and it is being strongly impressed on the pub but too little attention is being directed to food valu There is thus more than a possibility that the importa of the latter may be obscured by the prominence giv to the former. Efforts to improve the hygienic a nutrient qualities of milk ought to go hand in hand. grading is to serve a really useful function, and is justify the cost of its application, the scheme must well balanced and have for its object an all-around a not a one-sided development.

''The fat content of milk provides the simplest mea of arriving at a measure of the nutrient properties milk and in grading on a basis of chemical composit the butterfat percentage must constitute the standa It is eminently desirable that a minimum legal standa of milk should be set up which should be the pres

We do Retinning and Rebuilding of All Kinds

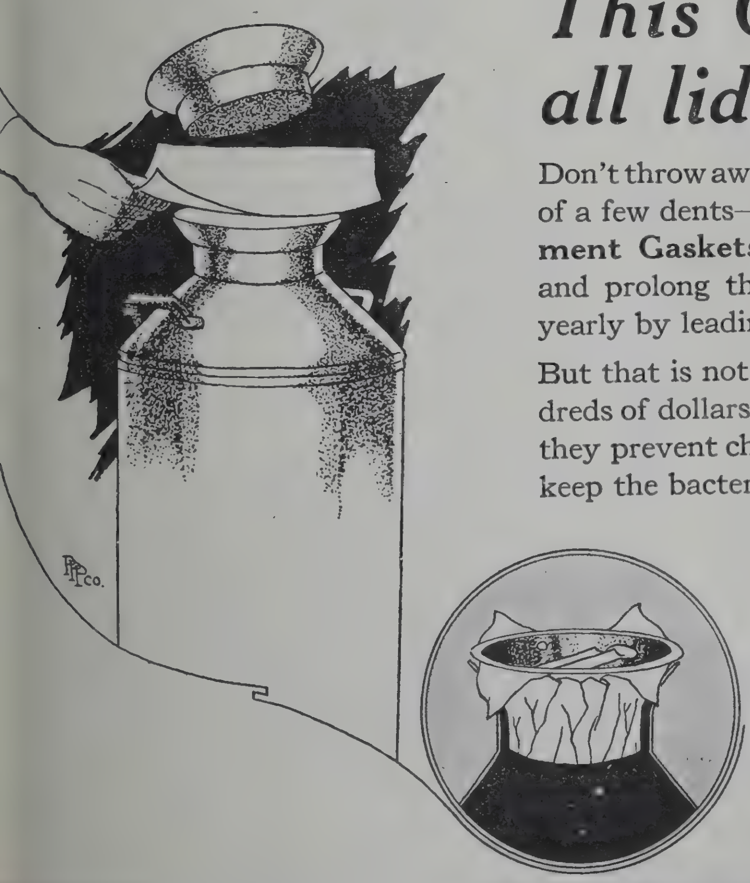
We Can Quote You on Good Quality New Cans.

1750 Carroll Avenue :: CHICAGO, ILL.

This Gasket makes all lids fit like new!

Don't throw away perfectly good cans or lids because of a few dents—use **Paterson Vegetable Parchment Gaskets.** They make all lids fit like new and prolong the life of every can. Millions used yearly by leading milk shippers.

But that is not all! Parchment Gaskets save hundreds of dollars worth of "spilled milk and cream"; they prevent churning of cream in the lid and help keep the bacterial count where it belongs.



Parchment Gaskets are easy to use. They come cut to size in packages of 1000. **Soak them thoroughly in clean water,** place over neck of the can and jam down the metal cover.

presumptive standard of three per cent fat, and
cent of solids not fat."

The fundamental weaknesses of a bacteri
standard lies on the necessity of basing it almost
on members of bacteria irrespective of kinds, bu
used in conjunction with supervision by inspecto
teriological standards are of material value in pr
a test of the efficiency and adequacy of inspecti
the application of bacterial standards to the gra
milk the choice lies between the numbers and th
of bacteria present.

It is not contended that numbers do not posses
nificance from the public health and from an ec
point of view. Heavy bacterial contamination in
a carelessness in product and subsequent handli
indifference to the fact that contamination can
differentiated from the indifference to the nature
tamination. Dirty milk containing large numbers
teria is more likely to contain pathogenic organism
the milk over which careful supervision has bee
cised. Large numbers of bacteria also indicate t
terioration and souring have already commenced,
take place rapidly; they are evidence that the qua
soundness and freshness have been impaired.

Assuming numerical bacterial standards wer
used for the purpose of grading milk, it would be
sary as a preliminary procedure to standardize th
ods of examination in every detail. Bacterial co
not claim to be more than estimates of the nu
bacteria in milk and without standardization
methods it would be impossible to obtain results
would be even approximately comparable. The
applying numerical bacterial standards in any sy
grading milk would be heavy and would const
serious objection to their use. The force of this
tion would be strengthened by the fact that the i
tion gained would not be proportionate to the
securing it. Numerical standards are fundament
fective, inasmuch as they consider numbers on
take no account of this kind. In this respect th
stitute an unsound guide to the quality of milk
pathogenic bacteria being infinitely more cap
harm than millions of the saprophytic organisms
always constitute the majority of the bacteria fo
milk. Numerical bacterial standards have a most
place in administrative work, but it would be diff
justify their inclusion as a fundamental part of
eral system of grading milk.

If it were possible to determine the different k
bacteria present in milk by a simple and rapid pro
valuable information for the purpose of classifyi
would be available, but, unfortunately, the me
rapid and accurate differentiation do not exist.

The bacillus tuberculosis is an exception to th
eral rule and it is by far the most common of the
genic bacteria found in milk. The tuberculin te
vides the means whereby an assurance can be ob
that this dangerous organism will not be present i
from a particular source. It also provides a v
means whereby milk may be graded definitely an
ply into two main classes — milk from tubercu
herds and milk from non-tested herds.

Beginning about 1893 the use of the tuberculi
vealed a large amount of tuberculosis in dairy
and the public was impressed with the danger of s
ing tuberculosis through milk. Later investigatio
ticularly those made during the last fifteen year
fully demonstrated the danger of tuberculosis
transmitted to children from the cows by way
milk. Occasional epidemics of septic sore thro

Effective Pasteurization

There is 100% Assurance

The Faultless Way

Ineffective pasteurization is just a waste of time and money. Unless the milk is heated to proper temperature and held there the proper length of time—not just some of it but all of it—then your pasteurization is ineffective.

There is no question about the effectiveness of the Faultless Way of Pasteurization. Each self-contained unit of the Faultless Positive Holder is automatically filled, held and discharged by compressed air. There are no valves to get out of order, no complicated mechanism to adjust. Just a simple, fool proof, common sense equipment that pasteurizes milk scientifically correct.

Positive
Automatic
Valveless
HOLDER

The Faultless system of Positive Automatic Pasteurization is easily and economically adapted to rapidly expanding milk plants.

Pure Nickel is used in constructing the Faultless Holder, giving utmost sanitary protection and longer life to the equipment.

typhoid fever and the less frequent epidemics of scarlet fever and diphtheria transmitted in the same way have given good grounds for the suspicion regarding the healthfulness of ordinary milk. The amount of danger from this source is commonly overestimated, but its existence, particularly in the case of children, is beyond question and should not be overlooked.

It has also been recognized that tuberculosis is only one of a series of diseases that may be distributed through the milk supply. Any plan which is to make milk a safe article of food must take into account, not only the disease that may be transmitted from the cow but also the more formidable list of diseases that may be transmitted from the people who handle it to the people who consume it. The history of certified milk has made it evident that a careful medical supervision of both animals and men will reasonably protect the milk from danger of transmitting human diseases, but the expense of such supervision is large.

It is not enough that a bottle of milk shall have abundance of cream in order to be accurately characterized as good milk. If such milk should contain even a limited number of virulent typhoid fever organisms, it would be rejected by anyone who was acquainted with the fact. While the milk business is conducted primarily because milk is a valuable food, the occasional appearance of an epidemic spread by the use of milk has made the public suspicious of the healthfulness of the milk. This public suspicion is a severe handicap to the milk business and any procedure that will remove this suspicion and stimulate the increased consumption of milk will be of great economic benefit to the dairy industry as well as to the consumer.

In order to conform to the general opinion of a good milk, it is not sufficient that a milk have a good food value and be free from disease. If at the bottom of the bottle of milk there is a distinct sediment, the purchasing public will uniformly reject the milk as being of poor quality. The public is justly desirous of having a clean food supply, and there is probably no food supply regarding which it is more particular than milk. The extreme sensitiveness of the public in this regard is due to the fact that milk more readily lends itself to inspection. The white milk forms a natural background against which any foreign matter stands out with startling distinctness. As a result of these physical conditions the unaided eye is able to detect the presence of foreign matter in milk when it is present in such minute quantities as to defy detection by analytical methods. The sensitiveness of this inspection is shown by the fact that it is possible to find traces of dirt in a quart of milk
which is critically examined, regardless of the care
cised in its production.

Pasteurization of milk was early advocated as a m
of safe-guarding the consumer from dangers, not on
tuberculosis but of other communicable diseases. As
the tuberculin test, so with pasteurization, many p
cal difficulties are encountered in allying the proce
the milk supply.

The studies of Theobald Smith and of Russel an
Hastings, which pointed out the practicability of
teurizing milk at 140 degrees Fahrenheit for 30 mi
mark the real beginning of successful milk pasteuriza

The pasteurization of milk should be between
limits of 140 and 150 degrees Fahrenheit. At 14
grees Fahrenheit the minimum exposure should b
minutes. In order to allow a margin of safety u
commercial conditions, the temperature during
period of holding should be made a minimum of 1
145 degrees Fahrenheit and the holding time 30 min

The process of pasteurization must be under ca
supervision, and the supervision should be under
personal inspection of the milk commissioner. Th
tervals between inspection should not be more th
month. Each pasteurizing plant should be score
means of the score card. Specimens of milk for
terial analysis should be taken at the different stag
pasteurization and subsequent handling.

All modern plants handling 800 to 1,000 quarts of
or more a day are now equipped with automatic te
ature regulators, flow regulators and recording therm
eters. The records of these should be examined b
department of health not less often than once a m

The fundamental objects in grading milk are:

1. To aid in a constructive way in making saf
drinking purposes all milk which can legally be sol
drinking purposes.

2. As a means of distinguishing between class
milk, which, while they may be safe, are of differen
grees of excellence in respect to handling and cle
ness. Each community should make an effort to g
its milk supply so as to best attain these objects wit
departure from the broad general principles set f

Considerable progress has been attained in a na
wide way toward separating market milk and cream
grades on a definite basis of sanitary or market
and many cities and some states have established de
grades chiefly on the basis of sanitary quality as a m
of safe-guarding the consuming public. Such a m
ment is in just keeping with business practice in
lines of endeavor. A workable or practical syste
grading will do much to insure the milk producer b

You Get Extra Strength in

REPUBLIC Bottle Crates

"As Strong as the Republic"

LIKE the spokes in a wire automobile wheel, the strong, galvanized stacking irons in Republic Bottle Crates are riveted solidly through the sides and ends. This gives them an extra margin of strength to withstand sudden shocks and the wear of constant handling.

Besides this, "Toncan," the highest grade of galvanized metal obtainable, gives Republic Bottle Crates longer life and greater resistance to rust.

Before you buy, get complete information and prices. You will save money on Republics.

paid on the basis of the quality of his product. It will also make it possible for the consumer to purchase the grade desired. Kansas City has made a detailed organized study of its own conditions and the procedure followed by this city will serve to show how milk may be properly graded to the mutual gain of all concerned. These grades of milk are set forth in the ordinance as passed by the common council of Kansas City and enforced by the food and dairy division of the health department.

Requirements for All Grades of Milk.—(a) Veterinary Examinations.—Each and every grade of milk as defined in this ordinance shall be obtained only from cows free from disease as determined by tuberculin tests and physical examinations made by a qualified veterinarian authorized by the state in which such tests and examinations are to be made or by the United States Department of Agriculture, and, having a certificate issued by the board of hospital and health of Kansas City, Mo. (b) Medical Examinations.—Examinations to determine the physical conditions of persons required to be examined by the provisions of this ordinance shall be made by a qualified physician. Wherever any evidence suggests that any person producing or handling milk is a carrier of any infectious disease the board of hospital and health may require that such person be given, by a qualified physician, the special examination necessary to determine the presence of such infection. (c) Procedure and Frequency of Bacterial Testing.—Bacterial tests of milk and milk products shall be made in conformity with the standard methods recommended by the American Public Health Association. The bacterial count of milk, skimmed milk and cream, of any grade, shall be determined from samples of the raw material and finished product taken at following points. (d) Cooling.—All milk, cream, skimmed milk and buttermilk shall be cooled to a temperature of not more than fifty (50) degrees Fahrenheit before being placed in the final container and maintained at such temperature until delivered to the final consumer.

Provided that milk is bottled and pasteurized within one hour after the completion of milking such milk need not be cooled until immediately following the completion of pasteurization. (e) Only One Grade of Milk to Be Produced, Bottled or Canned at One Plant.—No grade of milk, skimmed milk or cream shall be produced, bottled, canned or placed in any final container in the same dairy farm or milk plant where any other grade of milk, skimmed milk or cream is produced, bottled, canned or placed in other final container.

Standards and Requirements of "Grade A Raw" Milk, Skimmed Milk and Cream.—"Grade A Raw" milk, in addition to other requirements of this ordinance, shall be obtained from cows free from disease, tuberculin tested semi-annually and examined physically each month in the manner provided for in this ordinance; and shall be produced and handled by persons free from disease as determined by a monthly medical inspection made by a qualified physician and under such sanitary conditions that the bacterial count shall not exceed thirty thousand (30,000) colonies per cubic centimeter at the time of delivery to the consumer.

Milk in this grade shall, immediately upon being drawn from the cow, be cooled to a temperature not higher than fifty (50) degrees Fahrenheit, and shall within one hour after the completion of milking, be put and kept in the closed final container.

"Grade A Raw" milk, skimmed milk and cream shall be sold in bottles only and be delivered to the consumer within twenty-four (24) hours after production.

Producers of "Grade A Raw" milk shall be pr
with a steam boiler or independent supply of
water adjacent to the milk house.

Caps of all bottles containing "Grade A Raw"
skimmed milk or cream shall be white with black
ing with the grade and designation "Grade A
milk, skimmed milk or cream as the case may
name and address of the dealer, the place of produ
the day of bottling and the word "Certified"
authorized by a medical milk commission in acco
with the state law, clearly, legibly and conspicu
displayed on the outer side thereof.

Certified milk produced under the supervision
medical milk commission shall conform to "Gr
Raw" milk as required in this ordinance. Certifie
shall be subject to the same supervision and cont
ercised by the board of hospital and health as said
exercises over all other "Grade A Raw" milk.

Standards and Requirements of "Grade A P
ized" Milk, Skimmed Milk and Cream for Infant
Children.—"Grade A Pasteurized" milk, skimme
and cream, in addition to other requirements of thi
nance, shall be obtained from cows free from disea
tuberculin tested annually and examined phy
every six months in the manner prescribed in this
nance and shall be produced and handled under
sanitary conditions that the bacterial count shall
time exceed one hundred thousand (100,000) coloni
cubic centimeter when delivered to a pasteurizing s
in the country and shall not exceed two hundred
sand (200,000) colonies per cubic centimeter whe
livered to a pasteurizing and bottling station in th

All such milk and skimmed milk shall be paste
and the bacterial count of the finished product as
ered to the consumer shall not exceed thirty tho
(30,000) colonies per cubic centimeter.

Milk, skimmed milk and cream of this desig
shall be delivered to the consumer within thirty-six
hours after pasteurization.

Milk, skimmed milk and cream of this grad
designation shall be delivered to the consumer in b
unless otherwise ordered and permitted by the bo
hospital and health.

The caps of all bottles containing "Grade A Pa
ized" milk, skimmed milk, or cream shall be white
black lettering with the grade and designation "Gr
Pasteurized" milk, skimmed milk or cream, as th
may be, the name of the dealer, the day and hou
tween which pasteurization was completed, and the
where pasteurization was performed, clearly, legibl

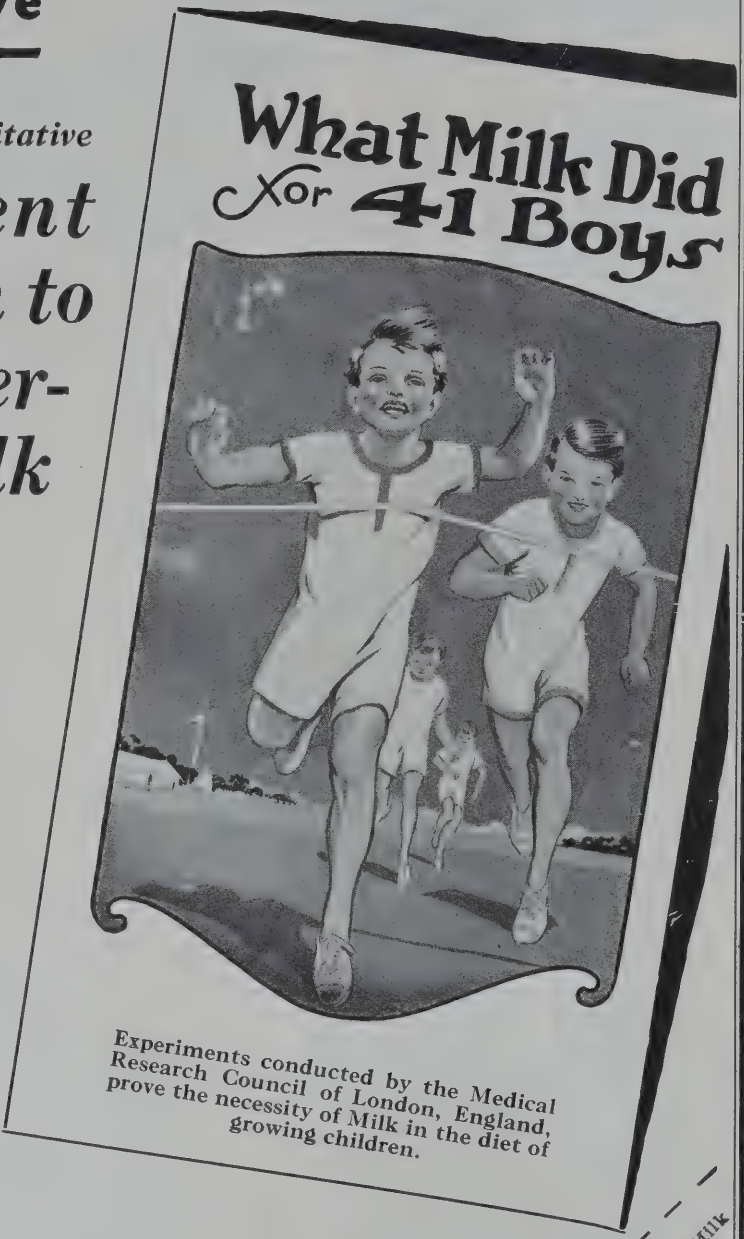
Just What You Have Been Waiting For—

AN Extensive and Authoritative Experiment with Children to Prove the Wonder-ful Value of Milk



What Milk Did For 41 Boys

Experiments conducted by the Medical Research Council of London, England, prove the necessity of Milk in the diet of growing children.

Up to the present time, practically all ex-
riments to prove the value of milk have been
nducted on animals, and it has been necessary
try to persuade the housewife that if milk
ade animals grow then it would make children
row. Now, however, information is available
owing what milk actually does for **children**.

The Medical Research Council of London,
nducted an experiment on 220 boys. Their
dings are given in a popular way in this little
x page folder—actual size shown here.

You can now secure these folders for your
vn use in any quantities desired. Your name
n be imprinted on the back page if you wish
a slight additional cost ($1.50 per M; 10,000
more $1.25 per M).

These valuable circulars suitable for enclos-
g with your monthly statements, for distribu-
on through your driver-salesmen, and of great
orth in many other ways, will cost only—

$5.00 per M for 1,000 to 10,000
4.50 per M for 10,000 or more

Your order will be filled promptly.

Don't overlook this opportunity. Every customer and prospective customer should know of this wonderful experiment on children.

(Continued from page 21)

Yes, we believe the good-will of the coming generation is worth the investment of a proportionate share of our annual advertising appropriation.

Along with this article we are showing an advertisement that is by no means average. It illustrates fully the point I have tried to make. It is an ad showing a young man standing near a rather elderly man, his hand clasped in the other's. A great, beautiful milk bottle is standing in the background, as a great white sentinel of security that emphasizes the importance of what the elderly gentleman is telling the other, which is in effect, this:

"Jim, old boy, you have done some good work for this outfit, and we appreciate it. So as reward for your industry, alertness, agility, wakefulness to your organization's interests, etc., we are going to make you head of the department of pig knuckles."

But now what the ad really meant, and the story that it carried was this: Jim lived a good, clean life. He chose his food well. He had sense enough to know milk would keep him fit, alert, alive, on the job, and it was because of this drinking of milk that Jim delivered the goods and got the plum when the old tree had a shakedown. Isn't that clear? It's just one of the finest, clearest, most life-like pictures any artist could draw!

Promotion! Let milk be associated with promotion, advancement, achievement — get these thoughts fully rooted into the minds of men—and you will have a sales appeal for milk that can never be shaken — never be shaken!

You don't create that clear, life-like, convincing picture with the old stereotyped ads that say, Milk makes you healthy, or the Blank Dairy sells the best milk in town, or the Whoosit Bros. Milk Company feeds milk to two-thirds of the infants in town.

But picture men and women doing the things that men and women like and love, and associate those scenes with milk, and you will identify milk with the lives of men and women so strongly that it never will be separated.

You will better realize how much the milk industry is overlooking its real avenues for life-like illustration of the milk story when you reflect upon how effectively manufacturers are advertising such products as prunes, dill pickles, sauerkraut, pickled pig's feet, animal
ers—any number of things that we seldom think
any but a humorous vein, as vehicles for our joke
sarcasm. Certainly nothing romantic and heroic
them!

Yet these people, with the true skill of the mer
dising artists that they are, are presenting their pro
to a credulous public in an appealing way—by sh
what they **do,** not merely what they **are!**

In your school days, no doubt, you often were
upon to draw pictures of horses and cows. And
less you once, or several times, did what this writer
did. After drawing a picture of a cow he wrote un
in big, scrawling letters, "A COW."

"Young man," said the school teacher in a wa
we never shall forget, "if you can't do a thing
enough for the achievement itself to show what has
done—then don't do it!"

That's our viewpoint on advertising milk; if we
make this picture so real and vivid that the publi
know what is behind milk, what it stands for in
and happiness, then let's don't bother with a silly,
teurish picture that doesn't tell anything except we
several bottles of milk to sell.

Milk's Competitors.

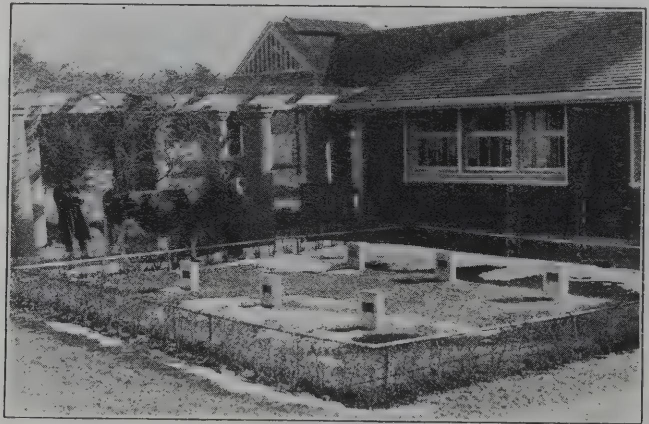
Competition in the milk industry has been disc
from many different angles, but here is one angle
strangely enough always to me, was overlooked: It
fact that the strongest competition we face today
competition of the advanced merchandisers in other
of industry, the competition of other men who have
thing to sell and want to get the attention of the p

If you don't believe this competition is real, vita
a factor in the progress of our industry, I ask you to
now through the popular mazazines and the newsp
and take note of just how many fine, splendidly cr
pieces of advertising that are fairly crying out, "
at me, don't turn further, my only purpose for
here is to let you see me, and I don't want you
anything else but me."

The reason for this is, the other industries have
much farther in studying their merchandising oppor
ties than we; they have better perfected their art
they are crying for the attention of the public i
merchandising appeals they have created — cryin
loud.

This merchandising competition is a thing
reckoned with sooner or later, but the sooner the b
Long ago the very best thought and genius known
printing art was devoted to the advertising colum
periodicals, with every energy bent to the sole ai
making sales appeals interesting, compelling, grip
holding the reader so he cannot let any other tho
enter his mind except the buying thought that th
seeks to create.

That, in short, is making the picture real — tr
life.



A CEMETERY FOR PRIZE CATTLE.

Nationally known prize-winning cattle are buried in this cemetery on the Langwater Farm at Easton, Mass. Each headstone is fitted with a bronze tablet bearing the name and record of the beast and the grounds are kept in perfect condition by the gardeners. One of the animals buried here is "Langwater Warrior," one of the most famous of blue-blooded cattle. His sons and daughters were sold for a total of $300,000, which is thought to be a world's record. This is probably the only cemetery of its kind in the country.

BOTTLE EXCHANGE OWNS THE BOTTLE

In Appleton, Wis., the milk dealers support a
exchange and the exchange owns all the bottles
by the members. Each bottle has blown in it the
lowing: "This bottle property of A. M. D. A.," th
ters being the abbreviation for the "Appleton
Dealers' Association." The cap carries the words "
bottle filled by ...... Dairy Company.

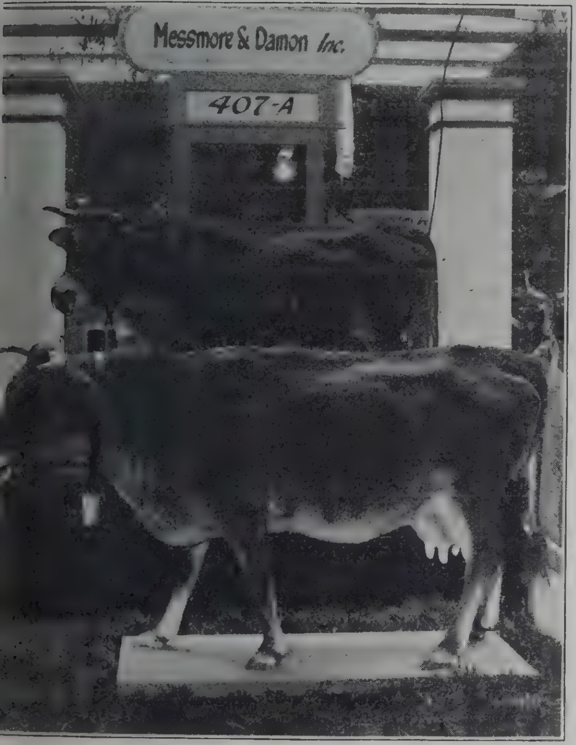
The state attorney general was asked whether
constituted misbranding and he replied that it did

The Sensation of he Exposition !

—In Detroit

ANIMATED Life-Like Cows

That Move Their Head, Eyes, Mouth and Tail



On display at J. L. Hudson's Department Store, Detroit, Mich. Between 6 and 7 P. M. ver 3,200 people stopped to view these nimals.

At the Exposition we have registered 500 repre- entatives from the largest dairies and ice cream lants in the United States, Canada and Europe, aking actual sales to these countries.

hese cows will secure good locations for your isplays. They will work for you night and day, ringing increased business and reputation.

If interested, write or wire for full particulars.

Who Pays the Price of Dirty Bottles?

YOU DO, MR. DAIRYMAN!

Every dirty bottle that comes from inefficient bottle-cleaning machinery in your plant is an absolute profit-destroying liability!

Play safe. Use only *clean* bottles, assured by Meyer-built bottle-*cleaning* equipment. The vital problem of securing sterile bottles is being solved every day by Meyer installations in some of the largest and finest milk plants in the world. Meyer-Dumore and Dumore-Junior Bottle-*Cleaners* are being bought in greater numbers than any other similar type of equipment.

The Meyer method of sterilization is *recognized!* The process includes submerged soaking, outside brushing, inside brushing, rinsing, outside rebrushing, inside rebrushing, and rerinsing. Every operation is thorough, and you can be assured of getting *clean bottles with the lowest possible bacteria count!* No spoilage from dirty, unclean bottles—no decrease in profits from lowering of quality and consequent loss of customers' good will!

Get the complete Meyer story. You need this scientific bottle-*cleaning* system in your plant. Write for bulletins giving complete information.

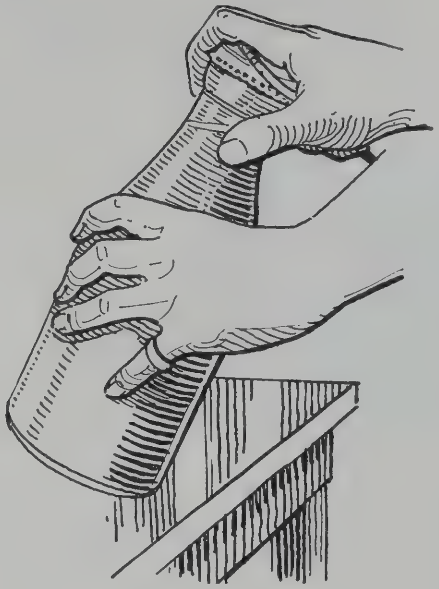
Manufacturers of Jointite Pure Cork Products for all cold insulating purposes.

THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

The Dairymen's Slide Rule

DEVELOPMENT AND USES IN DAIRYING

By B. I. MASUROVSKY, Consulting Dairy Chemist and Technologist

The dairy industry is developing rapidly and utilizes modern methods in every phase of its endeavor. One of the most important phases of dairy manufacturing is that of standardization. The latter involves the standardization of equipment, processes, and formulas. In mixing dairy ingredients for various dairy products there is need for a device to facilitate the computation of mixes according to set forth formulas.

The Dairymen's Slide Rule is designed to meet such a demand and aid in standardization of milk, cream, and ice cream mixes as well as to facilitate rapid figuring of arithmetical steps involved in solving dairy problems. It also helps to compute yield, overrun, amount of butterfat and kindered essentials pertaining to the manufacture of dairy products.

Originally the Dairymen's Slide Rule was intended for the interpretation of the American Standard Babcock Formula, namely, $L \div 4 + .2$ equals M.S.N.F. (milk solids not fat). For this purpose scales were constructed to be placed on a straight line and resulted in the B. F. (butterfat) scale representing the percentage of butterfat; Sp. Gr. (specific gravity) scale to express the degrees of Quevenne Lactodensimeter and scale S. N. F. (solids not fat) showing the percentage of M. S. N. F.

At a later date the inventor developed a factor which helps considerably in the standardization for butterfat in various mixes and named it the B. F. f. (Butter fat factor). Accordingly an additional scale was placed on the Dairymen's Slide Rule to interpret the B. F. f.

Finally there arose a need for a set of scales which would cut down on the time consumed in multiplication, division and proportions leading to a modification of well recognized logarithmic scales and known as scales A and B on the Dairymen's Slide Rule.

These various steps in the development of the Dairymen's Slide Rule were carefully considered and worked out during a period of two years concentrated research and submitted to the patent office during the year 1923, obtaining patent No. 1,488,823 in April, 1924.

The next problem was to secure a manufacturing concern which could make precision scales necessary for accurate figuring and at the same time the concern to be of well recognized and established reputation in the line of slide rules. It was not until 1926 that the inventor was successful in securing the Keuffel and Esser Co. to manufacture the Dairymen's Slide Rules.

All in all it took about five years of concentrated effort to put the Dairymen's Slide Rule on the market for meeting the demand of the dairy industry for a device of this sort.

In using the Dairymen's Slide Rule it must be borne in mind that the divisions on each scale represent not inches or centimeters but numbers which are used in plain arithmetic; furthermore, the figures marked on the scales A and B have only relative values, and the prime 1, may represent any value that is a multiple of ten, such as 10, 100, 0.1, 0.01, etc. After the initial value is assigned to the index, the same ratio of value must be maintained throughout the entire scale on the straight forward line. If for example, the value of 100 is assigned to the left index of the A and B scales the other prime figures will be 200, 300, 400 . . . . 900, 1000. The intermediate graduations between the prime 1 and 2 will then be 110, 120, 130, 140, ... 190, 200, and the subdivisions between the prime 1 and the following intermediate graduations will then be 102, 104, 106, etc.

How to use the Dairymen's Slide Rule in determining the percentage of milk solids-not-fat of milk when the butter fat percentage is known and the specific gravity is given in terms of Quevenne degrees.

EXAMPLE I.—Given a sample of milk testing 4% B. F. and a Lactometer reading of 31.2—Find the percentage of milk solids-not-fat in the given sample of milk.

SOLUTION:—Draw the movable part of the slide rule to the right so that arrow points to 4 on the B. F. scale. Then place runner so that its tread line coincides with 31.2 on the Sp. Gr. scale and at the same time read the percentage of milk solids-not-fat on the S. N. F. scale which coincides, in this case, with 8.6.

In all examples of this kind it is understood that the Lactometer readings are taken at 60 degrees F. and the operator of the Dairymen's Slide Rule will have no difficulty in making determinations of M. S. N. F. in milk samples which have been tested for their butterfat content and specific gravity.

The same is true in regards to the use of the scales A and B or the utilization of the B. F. f. (butter fat factor) scale of the Dairymen's Slide Rule. For instance, if the problem asks for standardizing cream from a high butter fat content to a lower one the following steps are fundamental as illustrated in the example below:—

EXAMPLE II.—Given cream testing 38% B. F. and sweet skim milk and it is necessary to thin it down to have the cream test 11% B. F.—Find the amounts of cream and skim milk per 100 lbs. standardized material.

SOLUTION:—Opposite 38% on the B. F. scale find 2.63 as the B. F. f. of the given cream. Then follow the settings of scales A and B of the Rule as given below:—

A : Set 1 : Under 11
B : On 2.63 : Find 29 pounds

of cream testing 38% B. F. for every 100 lbs. of standardized cream testing 11% B. F. and 100—29 or 71 lbs. of skim milk.

Notice:—Special standardization problems will be taken up in a series of subsequent articles in which the use of the Dairymen's Slide Rule will be illustrated.

THE DAIRYMEN'S SLIDE RULE IS DISTRIBUTED BY

THE OLSEN PUBLISHING CO. 501-515 CHERRY STREET
MILWAUKEE, WIS.

AND WILL BE SHIPPED ANYWHERE
POSTPAID ON RECEIPT OF $5.50

ONCE A USER BECOMES FAMILIAR WITH MAKING THE CALCULATIONS BY THIS SLIDE RULE MUCH TIME IS SAVED AND THE HIGHEST DEGREE OF ACCURACY RESULTS.

Notice—In a subsequent article a description of the Dairymen's Slide Rule will be given so far as its development and uses are concerned.

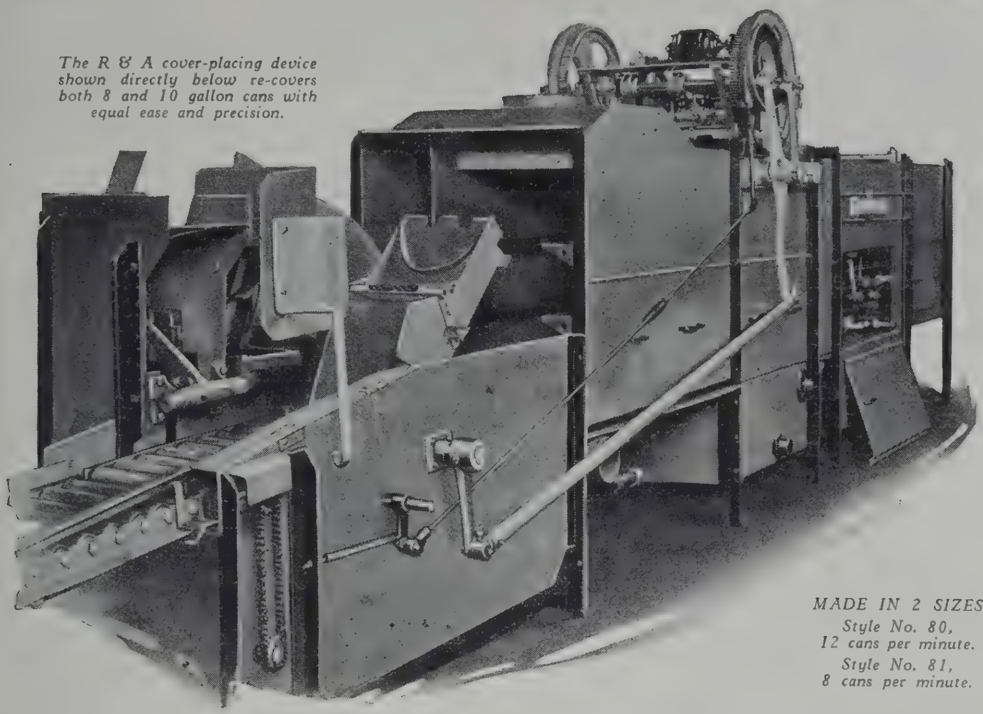
NEW GLASS-LINED CAR TESTED—PROVES SATISFACTORY.

Recently, at Marshfield, Wis., a glass-lined tank car, which has just recently been developed for transporting milk over great distances, was loaded with tuberculin-tested milk. It contained 6,000 gallons of milk, 40 10-gallon cans of 40 per cent cream. The content was cooled to 35 degrees, the car was locked and sealed, and with the temperature outside at 26 degrees, it was on its way from Marshfield at 1 P. M.

The car reached Miami, Fla., four days and five h later. Its contents are said to have arrived in pe condition, the temperature of the milk being 36 deg with an outdoor temperature of 92 degrees. The was shipped 1,800 miles with an outside tempera change of 66 degrees. Under these conditions the perature of the contents remained within only on gree of its original.

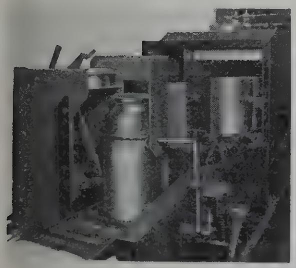
The R & A cover-placing device shown directly below re-covers both 8 and 10 gallon cans with equal ease and precision.



MADE IN 2 SIZES
Style No. 80,
12 cans per minute.
Style No. 81,
8 cans per minute.

Your Cans---*"clean as a whistle, dry as a chip" when the Champion goes to work fou you!*

One can at discharge position in washer. One can in uprighting cradle, the third can just re-covered



One can at discharge position—nearest can at re-covering position with cover just about to be fed onto the can.

TWELVE cans and covers per minute—washed clean, properly steamed and thoroughly dried. And when we say clean and dry, we mean it as you mean it!

Twelve cans per minute, both eights and tens, re-covered — each cover placed on its own can with a speed and precision that never fails.

That is why we call this can washer the "Champion."

Mechanically, it is extremely simple—and plainly sensible in design. No complicated, hard-to-reach parts to cause trouble. Every mechanical part which might require attention on outside of washer and instantly accessible. Entire valve mechanism on top of washer—easily reached for repacking and reconditioning.

In strength the Champion is the most rugged and rigid built today. Entire shell of washer 1/8 inch steel plate, electrically welded at all joints and bound on all outside edges with heavy angle iron. And, as practically no rivets or bolts are used, even after years of service this washer will be as solid and strong as the day it was installed.

Add to these facts, the virtue of very moderate price, and you have some idea of what Champion offers you in complete service, strength, and can washer value.

The Complete Story of the Champion will interest you. Write for it.

GELATINATED BUTTERMILK.

(Continued from page 25)

Experiments Conducted on Gelatinated Commercial Buttermilk.

Gelatine used in each series of the experiment was of four grades each of the same brand obtained specifically for this work. According to the manufacturer it was all of fresh run and guaranteed to be standardized as per data recorded in the table of results. Three-tenths (0.3) per cent was used in each experiment, this being the quantity deemed most desirable, all factors considered. The amount was accurately weighed on an analytical balance reading in grams to the third decimal place.

Four different cultures were used and with the exception of the first or preliminary trial, each was tested with the four grades of gelatine, thus eliminating possible error due to the use of each culture with but a single sample of gelatine.

Half-gallon quantities of fresh skimmed milk were used for each lot of every series, this quantity being accurately measured. Each lot was cultured with three per cent culture, measured with a scalded, buttermilk rinsed ounce measure, thus eliminating as far as possible errors due to variable acidities.

The buttermilk was made after the usual factory manner employing a culturing temperature of 68-72 degrees F. (Oklahoma Agricultureal Experiment Station Bulletin 156.)

Since occasional criticism has occurred regarding the method of adding gelatine to dairy products and the probable effect on quality and texture, it was decided to attempt elimination of this factor by the following precedure:

1. To lot I of each series granulated gelatine was added and the milk heated to 190 degrees F. while continually agitated. It was then cooled immediately to 68 degrees F. and cultured.
2. To lot II gelatine was added after the milk had been heated and then cooled to 135 degrees F., the gelatine in this case being dissolved in a portion of the milk at a temperature not to exceed 140 degrees F. This procedure eliminated a possible high temperature injury to the gelatine. The batch was then cooled to 68 degrees F. and cultured.
3. To lot III gelatine was added after the buttermilk had been prepared and broken up. In this case the gelatine was dissolved in one-fourth pint of water at not to exceed 140 degrees F. and added with thorough but not too vigorous stirring.
4. Lot IV, or the control, contained no gelatine.

Discussion of Results.

Acidity. The acidity of each lot was determined in duplicate by weighing nine gram samples into a beaker and titrating this against tenth normal alkali which had been originally standardized with fourteenth normal acid using methyl red as indicator. At the conclusion of the experiment the alkali was again standardized and found to be unchanged. Titrations were then made using the indicator, phenolphthalein. A conversion factor was calculated and the acidities changed into terms representing the use of phenolphthalein as is customary in milk plants. The above standardization which yielded a more dilute alkali resulted in titration believed to be more accurate than if phenolphthalein had been originally employed.

Using data obtained, the following acidity tables prepared.

TABLE I.

Per Cent Acidity of the Four Different Grades of Gela Averaged Separately.

		Gelatine Grade		
Lot	Sample	1	2	3
1	Gelatine added before heating	.868	.856	.846
2	Gelatine added after cooling to 135	.858	.872	.834
3	Gelatine added after making	.846	.816	.804
4	Control	.880	.824	.806

An examination of table I shows:

1. No noticeable reduction of acidity due to th of gelatine. In six cases the samples conta no gelatine were higher and in six cases l than the lots containing gelatine.

Continuing a study of acid development, Table II arranged showing the average per cent of acid whe various lots of each series were averaged disrega the grade of gelatine used.

TABLE II.

Average Per Cent Acidity of Various Lots of Each Se Disregarding the Grade of Gelatine Used.

		Lots			
Culture	Series	Gelatine added before heating	Gelatine added after cooling to 135° F.	Gelatine added after making	Control
A	1	.822	.810	.784	.78
B	2	.872	.878	.824	.85
C	3	.864	.866	.822	.85
D	4	.902	.892	.886	.90
Gen. Ave.		.865	.8615	.829	.84

A study of the table reveals the following facts

1. In the various lots of each series the acidi fairly uniform although considerable vari occurs between the different series. This be expected since different cultures were Other unavoidable factors may enter.
2. There appears to be no direct relation bet the acidity of the samples containing gelatine the control. In many cases the acidity of the atinated buttermilk was higher than that o control. This fact brought out by tabulatio the 64 different tests does not agree with the ings of Yaxis, who reports on two samples tarding effect of gelatine on acid developme

However, there is possibility of the acidity of atine having effected the results obtained. This is d ful considering the small quantity used. In vie the 64 tests tabulated in tables I and II and the addi al 16 preliminary tests, the conclusion is warranted gelatine added in such small quantities as 0.3 per does not bear a direct relation to the developme titratable acidity in buttermilk when produced u conditions here reported. As a matter of fact, the g average acidity of all samples of gelatinated butter was 0.8518 per cent as compared with 0.8475 per for the control, a variation of 0.0043 per cent, too s to be detected by titration methods.

Viscosity. The viscosity was determined as foll

A clean piece of plate glass was set at an ang 23°-40′ and upon its surface were scratched two lin a distance of 12 inches apart. A definite amount (2

ESTABLISHED 1903

Smoother, Creamier Buttermilk!

with ESSEX GELATINE

YOU can give your customers a smoother, creamier buttermilk and stimulate a greater demand for your product by improving it with Essex Gelatine.

¶ Essex Gelatine softens the curd and gives it a finer and smoother texture. It retards excessive acid, and prevents wheying-off. Essex Gelatine is widely used by manufacturers of highest grades of ice cream for body and smoothness; similarly, it is a wonderful improver for cultured or natural buttermilk. Very little need be used, and this small cost is quickly made up by increased sales.

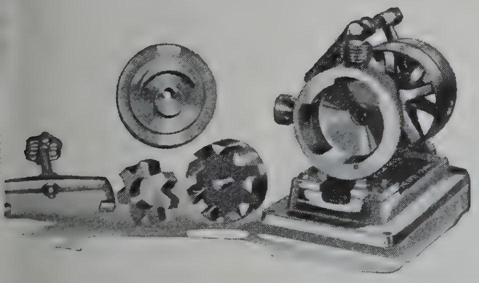
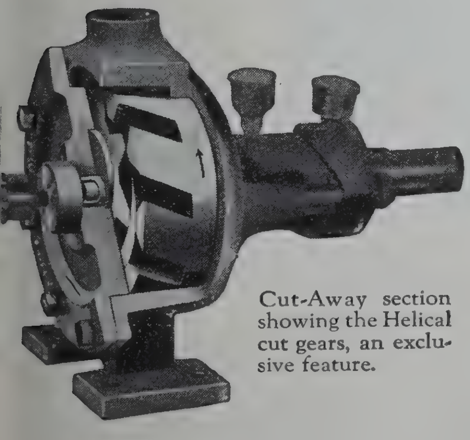
imple Smooth and Sanitary



The Perfection Rotary Sanitary Pump
(Disassembled)



Cut-Away section showing the Helical cut gears, an exclusive feature.

NOTE the extremely smooth finish and the accessibility to the interior. Also note the open pockets which are easily cleaned. There are only two moving parts in the pump, the internal gear rotor and the pinion. The rotor is supported by a bearing on both sides.

The teeth of the rotor work like a pair ot scissors on an angle instead of head on. The smooth running helical gears prevent excessive churning, eliminate shock or strain and deliver a uniform flow.

The Perfection Sanitary Pumps are made in Iron or Bronze. Bronze pumps nickel plated if desired. Capacities 8 to 90 gallons per minute. Industrial types for water or brine. Mounted on base with tight and loose pulleys or with reducing gear for individual motor drive.

Write for catalog and prices.

Perfection Manufacturing Company
2187 East Hennepin Avenue Minneapolis, Minnesota

PERFECTION
ROTARY PUMPS

of the buttermilk was run onto the glass at the first mark and the time taken in seconds required for it to run to the second mark. If the product failed to flow from one mark to the other it was marked with the notation "too viscous" as per the tabulated results.

A study of the table shows:

1. A great variation in viscosity between different lots of the same series. This may be due to a number of factors such as bacteriological difference in the cultures and in the amounts of each used, the method of treatment, breaking up the curd, grades of gelatine, etc.
2. That the viscosity of the samples taken immediately upon breaking at the setting temperature is relatively low. After holding for 24 hours at 48 degrees F. the viscosity of both the control and the gelatinated samples is greatly increased.
3. That the viscosity of the gelatinated samples after 24 hours storage was greater than that of the controls. This is especially well demonstrated by the results obtained in series I. Although not figuratively represented in series II, III and IV, the observation was made that the samples containing no gelatine generally flowed a greater distance over the glass plate than the gelatinated samples although both may have failed to reach the 12-inch mark and accordingly received the same notation of "too viscous." The conclusion is therefore warranted that the addition of gelatine increases the viscosity of cultured buttermilk.

Breaking and Strength. In each series except the preliminary all lots were prepared in the same type and size container, thus eliminating any variation due to these factors. No especial effort was made to determine this data other than by ordinary observation. The strength was obtained by pressing on the surface and forcing a milk agitator through the curd while the ease of breaking up was estimated by occular examination. Results are given in terms of numbers, 1 being the firmest and hardest to break, while 3 indicates that which broke up the easiest.

An examination of the general tables indicates a variable difference, although as a rule the gelatinated samples broke up the easiest and the curd appeared softer. This is to be expected in view of the action of gelatine in preventing the formation of large curd particles in sour milk.

Wheying Off. With the exception of the preliminary series wheying off tests were made by placing quarter pint bottles of the control and gelatinated butterm the storage room at a temperature of 48 degrees F. observations were made. In the preliminary second set of quarter pint bottles were placed in th oratory at variable room temperatures and observ made.

An examination of the tables reveals the fac gelatine prevents or retards wheying off. Att should be called to the similarity in many cases be lot 2 and the control. Close examination of th atinated buttermilk from lot 2 showed that in some gelatine was not dissolved as thoroughly as expect though great care was used in attempting to effect plete solution. Had the gelatine been dissolved in as was the case with lot 3, complete observation solubility would have been possible and more eff results probably would have been obtained. How a study of the table shows that:

1. Good quality buttermilk, which will not whe can be prepared without the use of gelatine a matter of fact, three pint bottles of the c from series 2, 3 and 4 were set away at va room temperature for ten days and fail whey off or show any signs of whey separati
2. Gelatine prevents wheying off in butte which without it might show this defect.

The most noticeable effect of gelatine was o flavor of the cultured buttermilk.

After preparation, the buttermilk was sample judges who were unfamiliar with the method of ing the samples. The buttermilk was then placed i ice box at 48 degrees F. for 24 hours and again sam In all cases no less than two judges and frequently five to seven sampled the product. Where a po doubt might occur, a tie was given the placing. U otherwise marked, the figures represent an unquest ranking of first, second, third or fourth place.

A study of the tables shows the control samp have been placed first 19 times; second, 8 times; once. It tied for a first, second, third or fourth eight times. The sample to which gelatine was a after making placed first only three times; secon times; third, twelve times, and fourth, nine times, four ties for third and fourth places. The samp which gelatine was added after heating ranked four times; second, seven times; third, eight t and fourth, thirteen times, with no ties. The samp which gelatine was added before heating placed five times; second, nine times; third, eight times, fourth, eight times, with four ties for first, second

TABLE III.

The printed record inside the register is shown at the top. Below are the tickets. Note how the figures on the tape and on the tickets agree.

, for the first time, dairies, creameries, and ice cream man-urers can eliminate errors, mistakes, carelessness, and losses cording milk received. For the first time, they can have as ive and as accurate a check on purchases as they have on sales. For the first time, this heretofore neglected branch of their business can be put on *a definite basis of facts* provided by untamperable, unchangeable, and automatically printed figures. All this is made possible by the

HMER Ticket-Printing Register

arkable register, which has already tartling economies in other indus- now been adapted with equally results for use in dairies, creameries, cream manufactories. With this n your receiving department you t you get every pound of milk that for. You no longer need depend satisfactory, slipshod, and illegible ures. Regardless of inefficient and nced help, there could ssible doubt about the s and accuracy of the ally printed figures is register makes.

What It Does

prints a ticket for the the milk. This ticket in less time than it tell it—shows the number of pounds. nt number, the classifi- d the consecutive num- he transaction. This anded or mailed to the check on his delivery. 's a feature even more t to you—a duplicate of the information on the ticket is also printed by the register on the secret, locked-in record inside the register—a *printed record* that at once becomes your original office entry and from which all other office records pertaining to each account are made.

Think what that means! It means, first, that you get positive, accurate records of milk purchases. It practically eliminates all arguments and disputes with milk suppliers. It speeds up work in your accounting department. *It stops losses and increases profits* all along the line.

See how the register in the Receiving Room is out of the way, and yet always convenient for use.

Get All the Facts About It

The installation of this register system is simplicity itself. It is so small that it can be placed in any convenient position without taking up valuable space. It is so light that it can be easily and quickly shifted from place to place. Within thirty minutes after it is installed any employee can take off the weights much faster and much more accurately than with any other system ever devised. It is made in the world's oldest and largest factory devoted exclusively to developing and perfecting printing and recording devices. It has 27 years of experience back of it. It is revolutionizing receiving and accounting methods in dairies, creameries, and ice cream manufactories because of the enormous saving of money it provides. Get all the facts about it. See how it will *save money* and *increase profits for you*. This will not obligate you in the least. Write or wire today.

third places, the ties being equally distributed between these placings.

A general summary of these results is shown in table IV.

The general average of all placings on flavor shows the control sample to have placed first almost four times as much as any one of the gelatinated samples.

In all fairness to the gelatinated samples notation should be made that while the average consumer might overlook the recorded flavor variations when sampling only the gelatinated product, he did observe the distinction when the control was likewise sampled, as brought out in the table of results.

A number of samples were set away for periods longer than 24 hours and then tasted for flavor with the resulting observation that the longer the gelatinated samples were held the more pronounced became the distinction between them and the control.

These results are quite the contrary of what had been expected and may have been due to a number of factors which yet remain to be solved. The type of bacteria in the gelatine may have been at fault or the effect of gelatine in stimulating the growth of undesirable bacteria may have produced a noticeable difference.
ever, in the light of the experiments reported, a
sion must be drawn that gelatine, at least that
this series of experiments, is somewhat detrime
flavor.

SUMMARY.

From the results obtained the following conclus
warranted:

1. Gelatine added to cultured buttermilk before
making increases the viscosity of the product
2. Gelatine added to buttermilk before or after
prevents or retards wheying off.
3. Good cultured buttermilk which will not w
can be prepared without the use of gelatine.
4. No noticeable effect on acidity was observ
might be attributed to gelatine. Variation
be attributed to bacteriological or culture diff
5. In the majority of cases the addition of 0.3
gelatine produces a slightly detrimental e
flavor of cultured buttermilk.
6. The longer the gelatinated samples are stor
24 hours the greater the difference betwe
flavor and that of the control.

COW WHO JUMPED OVER MOON GAVE MILK ITS KICK, AVERS HUMORIST.

"A lot of us are just as firm believers in the cow who jumped over the moon as Heywood Broun, the columnist for the New York World," says Miss Aubyn Chinn, nutritionist of the National Dairy Council. "Mr. Broun confesses that he had considered the tapering off of his milk-drinking at the age of three until he remembered that the very cow who furnished the two quarts for their house had been on a nightly journey over the moon and the stars."

"This was the milk that had been over the moon and back again. Taken in that spirit and with that knowledge, one could feel the lift and the kick of it," says our friend Haywood in his best Broun style.

There is a lift in milk—every milk drinker will agree, comments Miss Chinn. It does bring the stars and the moon nearer, for in that exultation that comes from being physically fit and glowing—that enthusiasm for life that comes from healthy living with the drinking and eating of the right foods—any individual is ready to reach up and pull down his own particular star. Capacity and power for achievement and accomplishment come to folks who are wise enough to observe health rules in their daily living.

The exhilaration of bouncing nimbly out of bed in the morning after a good night's sleep before an open window is second only to that experienced by the cow on her lark. A brisk walk in the sunshine, a refreshing bath, and a meal in which the vitamines of fruit, cereals and dairy products abound, will increase anyone's stellar attraction.

Prof. Burke's Inquiry -:- Department -:-

An Interesting Discussion of the Cream Plug

Wisconsin.

Dear Sir:—Please tell me how to overcome the cream plug on the bottles. We heat up our milk in a coil vat to 110 degrees, then we separate it. The cream we pasteurize in a flash pasteurizer at a temperature of 145 to 150 degrees and hold the cream in cans for 30 minutes. When we heat the cream up to 175 we do not hold it but cool it immediately to 42 degrees. Our cooler is an open one. A one and one-half inch centrifugal pump pumps the milk from the vat into the separator. Also which would be the best way to make the cream keep better and have no plug? The whipping cream has a heavier plug than the coffee cream. Is it necessary to run the coil all the while the milk is being heated; also when it it being pumped out?

Reply: The formation of a cream plug on bottles causes much annoyance in many plants and may be due to a number of factors. I trust the following suggestions may help you to overcome the trouble.

First: I suggest you separate the milk at a temperature of 80 to 90 degrees F. instead of 110 degrees F. Separating at a temperature of 110 degrees F. breaks up the fat globules and may produce slight churning. This effect would be more pronounced if the milk is pumped to the separator as you mention. It would be much better if you could arrange your vat to permit the milk to flow into the separator by gravity.

Second: Do not pasteurize the cream at a temperature as high as 150 degrees F. but rather heat to 142 to 145 degrees F. and hold for 30 minutes. If you hold it in cans you should agitate gently but frequently during the holding period. Holding without agitation permits evaporation of moisture from the surface of the cream, drying it out and in some cases causing it to show signs of oiling off. Then when the cream is cooled small granular fat particles are formed which pack in the top of the bottle and form a very hard plug.

Third: Cool as quickly as possible to 45 degrees F. or lower. Slow cooling, especially with vigorous agitation, is conducive to the formation of a plug.

There are other causes of the difficulty which I will mention although I do not believe they are the source of the trouble in your case. They are as follows:

1. Mixing pasteurized cream with raw cream.
2. Thawing frozen cream at high temperatures, followed by pasteurization at high temperatures.
3. Pasteurizing too rich cream.
4. Excess agitation during pasteurizing.

It is natural that whipping cream being richer in fat should have a heavier plug than the coffee cream.

Your second question relative to making cream keep better may be answered by stating the following four essential points:

1. Clean production of milk.
2. Sanitation and sterilization where possible, of all utensils and equipment wherein cream is stored.
3. Pasteurization at 142 to 145 degrees F.
4. Holding at a temperature of 45 degrees F. or lower.

Now referring to your postscript. It is quite necessary to rotate coils in a pasteurization vat while h
the milk; this to insure uniform temperature thr
out. However, it is not necessary to rotate the
while the milk is being held at the pasteurizatio
perature although I believe you will find it desira
operate them if they are operating at the proper
It is essential to rotate the coils when the milk is
pumped over the cooler, this to insure even distri
of fat and prevent possible injury to it. I suggest yo
to 120 degrees F. in the vat and then pump over the
er. However, do not cool below 110 degrees F. in t
or agitate the milk while it is between 110 degrees
60 degrees F. after pasteurization as you will cer
injure the cream volume appearing in the milk.

I am glad to hear from my friends in the dairy
try in Wisconsin since I attended the university
some years ago and I trust this information will be
ful. I shall be pleased to hear of the results you o

* * *

Dear Sir:—We are indeed thankful to you for
information. We have separated the milk at 8
88 degrees F. but had a very heavy plug. Perh
is due to the speed of the pump. The one and on
inch centrifugal pump runs 1450 r.p.m. We are no
to elevate our vat so it will flow by gravity int
separator. (The pump perhaps churns the cream
to 88 degrees F.)

We have been thinking of pasteurizing the
milk in the coil vat first at 145 degrees F., hold
there for 30 minutes at 145, and then separate it a
What is your idea of this, please, and how woul
do it? We are still separating at 110 degrees F
while we do get a plug every so often it is not as
by separating at 85 to 88 degrees F.

What is the advantage of cooling the milk do
120 degrees F. after pasteurization before it goes
the pump to the cooler?

Should you suggest to pasteurize the milk first
skim it at that temperature, what effect would tha
perature have on the De Laval separator No. 30?
it skim clean?

Reply: The trouble with the cream plug is un
edly caused by the centrifugal pump. In order to
it I suggest that you run the following experiment.
some milk and run it through the separator at 85 d
F. and at 110 degrees F. without pumping. Sav
bottle some of the cream. Then run the balance as
and save a sample obtained after pumping at both
peratures. Compare the two. If you find the pu
causing the trouble, I suggest you change to a
pump which operates at a normal speed of abo
r.p.m. The speed on many such pumps can be lo
or raised considerably to deliver the desired volum
force. I do not remember of you having mention
speed of your pump in the first letter or perhaps
have overlooked it. However, I believe if you wi
low the above suggestion you will have no furthe
ficulty or at least much less.

The reason for the trouble is that the pump ro
at 1450 revolutions breaks up the fat globules and

AMERICO" THE PASTEURIZER WITH A PURPOSE

ıe new "AMERICO" with improved coil control

The "AMERICO" embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an "AMERICO" User Says:
"We consider that 'AMERICO' is nearer perfection than any pasteurizer we have ever used."

Accurate Records Prevent Mistakes

A reputation for finest quality cannot long be maintained by guessing at pasteurizing temperatures, or depending upon unreliable instruments. In your milk coolers, too, money can be saved by an accurate control of temperatures. Too low a temperature is wasteful; and too high a temperature affects the serving condition of your cream.

To have your pasteurizing temperature and your cooler temperatures just right, at the safest and most economical point, install a

BRISTOL
Recording Thermometer

BRISTOL'S RECORDING INSTRUMENTS

pack in the top of the bottle, forming the plug. effect, as you mentioned, would be much greater to 88 degrees F. than at a temperature at which t was in a more liquid state as 110 degrees F. I cer would not suggest an attempt to separate the m 145 degrees F. Inefficiency and a loss of fat wo the result.

Some time ago I was engaged in a milk plant we had no arrangement for running the milk th the separator by gravity so we had a large circula made of tinned copper which had a faucet near th tom. This tank was double walled so we could he contents by hooking up a hose to a spout and circu hot water around it. Overhead we rigged up a and tackle and when the milk was warmed to the p temperature we hoisted the tank over the separato opened the faucet. Of course, this is a very crude od but it served the purpose in this small plant we could work out the system in no other manner.

Now as to the reason for cooling to 120 degr in the vat. When milk is agitated at temperatur tween 110 and 60 degrees F. in cooling from the pa ization temperature great injury results to the line on bottled milk because the fat particles are r broken up. Between 110 and 60 degrees F., the in a semi-hard condition. The injury is much mor nounced in cooling than in heating, the reason that the milk when heated passes through these c temperatures more quickly than it does while cooled. Neither has the vat been held for so long a at a temperature which tends to keep the fat in a state. If you cool in the vat to 120 degrees F. and run over the cooler, you will avoid this injury t fat and the bottle milk will have a good cream lin

* * *

Reply: Referring again to our correspondenc ative to the cream plug and your question of sepa milk at a temperature of 145 degrees F.

This is practiced in some plants and I have tr out on some cases myself but you will find the sep stops up very quickly and has to be taken apart frequently for cleaning on account of the exc amount of material thrown out in the bowl durin arating. There is also a disadvantage in that the se tion process may tend to increase the bacterial especially if the separator has not been thoro steamed. This because the milk is partially coole ing the separating process.

In your letter you mentioned heating the mi and holding for 30 minutes, then separating and is what I had in mind when I answered your lett March 12. I have been wondering what results occur if you tried separating as soon as the temper reached 145 and then held the skim milk and crean arately for a 30-minute period after separating. of course, would entail the use of more vats but it help overcome the difficulty. The De Laval cla should do satisfactory work although as mentioned former letter, you will possibly lose a large amou fat in the skim milk, especially if the separator b to clog up.

I shall be pleased to hear from you regarding steps in handling your milk succeeded in overco the cream plug. The cream plug is a problem of a many plants and I have answered many inquiries re ing this with the result that so far in every instan have overcome the difficulty. Your case, howeve pears somewhat different and more complicated others and I am sorry I am not in a position to your plant as I believe we could quickly corre

trouble. Hence my reason for asking you to let m from you later.

* * *

Dear Sir:—The pump was the cause of the plug when skimmed at 85 to 90 degrees F., and times at 110 degrees F. The speed of that par pump could not be changed very easily as the sar is being used to draw the milk out of a drop tan pump it over to the glass-lined vat. There was no for another one with the present arrangement o one room plant. So we have tried the idea of skin pasteurized milk and so far it has worked out perfect satisfaction. The skim milk has no mo than before, the separator does not clog up and the cream was perfect and kept longer. Howev cool it immediately and bottle it the same day. W still cooling it in ice tubs, but have ordered a tubular cooler for water and brine and then the will be cooled as it comes from the separator and b immediately. We have had cream a few days old showed no plug. Should anything develop we sh you hear again. Why do you object to this idea?

Reply: I am glad to note the cream plug diff has been eliminated. Your problem was somewha ilar to several already received only more complex. its solution I am happy to state that the cream trouble has been overcome in each case which is gratifying to me.

You ask my objections to separating pasteurized and I am glad to give you the following information

Milk is frequently separated at pasteurization peratures or immediately thereafter when par cooled. In fact, the idea is not a new one and if I a mistaken I believe we once had a special machin this purpose at Wisconsin University.

The advantages of the process are that it elim the necessity of pasteurizing both skim milk and c throws out a little more material from the milk and considerable time.

On the other hand, the great drawback is the bility of recontamination from a separator, or can thoroughly sterilized. Of course this could be la overcome by thoroughly steaming the separator and cans and rinsing them with an efficient gern such as hypochlorite. Again, assuming you were m the skim milk into cultured buttermilk which ne tated reheating to a higher temperature—you wou increasing pasteurization costs.

Thirdly—since the separator throws out more terial from very hot milk than from a luke warm uct, the bowl would have to be taken apart more quently for cleaning and in the case of separating a volume of milk this might let some of the fat pas with the skim milk and cause unexpected losses. small volumes very little if any effect would be not

Again in your problem we were trying to elim a cream plug. Warming the milk to a point when separator might have broken the fat globules more ily plus the extra force of the centrifugal pump have given a more noticeable cream plug and pern some separation of cream from the skim milk which could have been overcome only by the use of a hon nizer or viscolizer.

THE HANDYCAP CO. *Sales Office* **Irvington, N. J.**

tled. Have a loss of 1.5 to 2 per cent. Am ha
around 5,000 pounds of milk.

We had a loss of around 4 per cent of all bu
coming into the plant last month out of 180,000
of milk and 70,000 pounds of cream. Most of the
was churned and butter sold as prints, also enough
butter taken out for ice cream. Seems like the
rather high.

Any information you can give would be appre

Reply: The normal shrinkage on 1,000 gall
milk handled according to the system describe
usually run slightly over 2 per cent. A surve
ducted by the U. S. Department of Agriculture,
of dairying, covering shrinkage reported by 115
ranged from .3 to 7 per cent, with an average
per cent. This shrinkage was caused by batter
leaky or underfilled cans, carelessness in dumpi
draining cans, leaky bottle fillers, broken bottles
by rough handling of cases, milk being left in pas
ers, losses in clarifying and separating and losse
ing pasteurization and cooling.

Of course in plants handling a small amount
the percentage of loss would likely run higher t
a larger volume handled in a bigger plant. I
your losses might possibly be traced to separatin
teurizing and cooling. Perhaps in pasteurizing y
leaving open the covers of the vat. This allows
amount of evaporation to take place. If you are
this, I suggest the covers be kept closed. Aga
cooling process may be too slow, which would n
permit rapid evaporation but prove somewhat dis
to the cream volume. I suggest you cool as rap
possible to about 120 degrees F. in the vat and th
over the surface cooler.

It is, of course, impossible to determine the
of your shrinkage without being at your plant to
up on the trouble but I believe you should be able
this below 1 per cent from the weigh can. Possi
weigh can may be at fault. Have you checked
this?

Now as to the loss of 4 per cent of all butterfa
ing into the plant. This certainly is too great, a
or several factors may be the cause. These may be
as follows:

1. Inefficiency of separating the milk.
2. Loss of fat in buttermilk; I presume y
using the American Association Test for deter
the loss of fat in both skim milk and buttermilk.
modification of the Babcock test gives more relia
sults than the straight Babcock test and enables
check up on manufacturing results more closely.
3. Losses occurring by cream sticking to vats,
strainers, etc. I do not believe the loss here shou
ceed .2 to .3 per cent.
4. Losses occurring through weighing, samplin
testing cream. Perhaps your loss has occurred t
the method of reading cream tests. The complete
as you undoubtedly know should be set in a wate
at 130-140 degrees F. for five minutes and then
glymol added to destroy the meniscus just prior t
ing. A very slight error in weighing out the sam
reading the tests would cause either a deficiency
cess of fat, to appear on your books.
5. A loss in cutting out butter prints.

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

King City, Cal.—A milk condensing plant is to be erected here by the Nestle Food Co. to cost approximately $200,000. The plans have been approved by the New York office of the company.

Newman, Cal.—The San Francisco Dairy Co. is adding necessary machinery for the manufacture of cottage cheese.

Brunswick, Ga.—R. V. Crine, proprietor of the North Star Dairy, has purchased the dairy business of I. K. and R. B Burney.

Davenport, Ia.—At a regular meeting of the board of health it was decided to enforce the rule about labeling all milk distributed in Davenport as being from tuberculin-tested herds, to include shipments of milk made to Davenport from surrounding dairy centers.

Davenport, Ia.—The Washington Dairy, Inc., which was recently incorporated here, has a capital stock of $50,000, and was incorporated to buy, and sell milk, butter, and other dairy and food products, at wholesale and retail. Dan MacNeill is the president.

Glenwood, Ia.—The Glenwood Creamery is just finishing the remodeling and enlarging of their refrigerating room, preparatory to installing a new three-ton Baker refrigerating plant.

Waterloo, Ia.—Construction of the Sanitary Dairy Company, this city, has been begun. The new building will have a 40 foot front and will be 70 feet deep, and will be a modern one-story creamery plant of brick and concrete.

Chemung, Ill.—The Dean Brokerage Company has opened a new condensed milk factory here.

Marion, Ind.—The Producers' Cream Association has been organized here with no capital stock. The association will deal in dairy products. The directors are O. O. Brubaker, W. H. Myers, R. G. Stollsmith and Charles O. Apple.

Wichita, Kan.—W. F. Suhm of the Wichita Dairy, at First and Pennsylvania, this city, announces that he will build a modern pasteurizing and milk bottling plant at a cost in excess of $40,000. The brick building will be 40x80 feet, and the latest pasteurizing and bottling equipment will be installed.

Jennings, La.—Announcement has been made that Don Barker has purchased the entire stock and equipment of the Jersey Dairy from J. L. Low.

August, Me.—The Pine Tree Dairy Co., Inc., is to maintain a general dairy and creamery business at the building on Bridge Street. The new concern is practically a re-organization of the original one and the business will be conducted along similar lines as before. The new officers are F. N. Boston, president; A. E. Wakefield, secretary, and S. E. Dillon, treasurer.

Manistique, Mich.—Reorganization of the dairy products plant, this city, at a capitalization of $45,000, is announced by members of the firm. The plant of the company was formerly known as the Manistique Dairy Products Co. but is now incorporated under the name of Leid's, Inc., to deal in milk and its derivatives. Officers of the corporation have not been chosen as yet.

Batavia, N. Y.—The United States Gypsum Company of Oakfield is going into the dairy business. The new da
dustry will distribute milk in Oakfield and Batavia.

Brooklyn, N. Y.—The Federman Sanitary Dairy C
been organized here at 106 Ave. O. by Morris Federma

Cleveland, O.—A new dairy company was incorp
here with a capital of $10,000 under the name of the M
Farm Dairy Co., Inc. The incorporators are Philip F.
Mildred Gold, E. Ginsberg and W. Mitchell.

Bellingham, Wash.—Elmer and Milton Cyr, dairym
Kelso, well known in this city, are seeking a location t
a modern dairy plant in this city. It is possible tha
may take the building now occupied by the Ford Dairy
ucts Co.

Tonasket, Wash.—The Auburn Dairy Products Co., a
dairy concern located at Auburn on the coast, has pur
the plant and business of the Tonasket Creamery.

Vancouver, Wash.—According to Manager C.
twenty-five hundred dollars worth of machinery has be
stalled in the Mayflower Dairy, making it one of the
up-to-date dairies on the Columbia River. The plan
handles about 450 gallons of milk daily.

Eau Claire, Wis.—Articles of incorporation for a
dairy products company, with headquarters in Eau
have been filed with the secretary of state and the regis
deeds. The name of the new association is the Eau
Milk Producers' Association which proposes to hand
kinds of dairy products, equipment, etc. The capital
of the association is $75,000. The incorporators are
Hoeslys, Robt. L. Ray, Roy W. Gilbertson, S. Guthri
W. J. Davies.

Dallas, Tex.—The Dallas Milk Co., this city, has inc
its capital stock from $75,000 to $125,000.

Ellensburg, Wash.—Representatives of Armour
were in the city for the past few days with a view of
lishing a milk reducing plant in which whole milk is t
before being sent to the company's condenser at Enum

Wichita, Kans.—A modern pasteurizing and milk bo
plant will be built by W. F. Suhm of the Wichita Da
First and Pennsylvania Ave., this city, to cost about $4

Knoxville, Tenn.—According to W. T. Zion of the
man Drug Co., one of Knoxville's leading refrigeration
cerns, installation of a complete pasteurization and refr
tion plant for the Lily of the Valley Creamery, this city
take place as soon as the equipment and materials have
received. The installation of a storage plant and a s
hardening room for the ice cream products of the Lily
Valley Creamery will insure the proper handling of the
ucts of the creamery and will increase the efficiency
sanitary measures.

Hibbing, Minn.—Arthur Ekstrom, who is the own
one of the largest dairy farms in this section of the
was elected president of the Hibbing Milk Producers'
ciation at a recent meeting of the association. The r
showed the association in sound financial condition.
officers are as follows: Arthur Marvin, Lynwood, was el
vice-president; Claire Beebe, Lynwood, secretary, and
Olson, Swandale, treasurer. Frank Sheringer, Spudville
William Pederson, Swandale, were named members o
executive board.

Meyersdale, Md.—The Scott-Powell Milk Co. of Phil
phia and J. F. Reich and Mr. Hartley of the chamber of
merce, this city, propose building a sixty thousand d
milk plant in this city, if enough farmers can become i
ested and a capital of thirty thousand dollars raised.

Murfreesboro, Tenn.—Carnation field man, Ray Mays
has entered upon his duties. He is an experienced br
and dairyman and is competent to give valuable and he
advice on dairy problems and methods. At present he i

iting various communities to establish truck routes and supply milk haulers.

Chicago, Ill.—Another attempt to merge the Milk Producers and Pure Milk Association has been unsuccessful. A meeting of officials of the two organizations failed to reach a workable agreement whereby the two bodies could be molded into one representative dairymen's organization. Conditions laid down by the Pure Milk Association made it impossible, according to Milk Producers' Association officials, to effect a consolidation. It was outlined by representatives of the Pure Milk Association that the conditions under which members of the new or merged organization would be accepted for membership must be that only men who own tested herds can or will be members.

Plato, Minn.—The local creamery has contracted to sell their entire output to the Gould Cream Company of Minneapolis. They will ship all sweet cream.

Pensacola, Fla.—Southern Dairies Corporation is planning the construction of a $100,000 milk station here.

Fond du Lac, Wis.—Frank J. Bauer, of Campbellsport, who operates for the A. and P. Milk Condensary at West Bend, has added to his equipment a milk tank truck which is glass lined, has a capacity of 1,800 gallons and is carried on a five-ton truck.

Greenville, Mich.—Soren Peterson has sold his milk business to the Blanding Milk Co., which company has now taken possession of the business. Mr. Peterson will continue the manufacturing of butter at his creamery.

Clintonville, Wis.—The Clintonville Milk Company has broken ground for a new addition to its plant to enable it to take care of the growth of its business. The new addition will be 24x42x41 feet and will enable the plant to increase its capacity by 75,000 pounds of milk daily. The new addition is to be completed by May 1.

Redwood City, Calif.—The Kennel Dairy Company's plant in Visitacion Valley was destroyed by fire to the extent of $15,000.

Winter Haven, Fla.—The Peace Valley Jersey Dairy Corp. has just been incorporated here with a capital of $300,000 by J. W. Janssen.

Clinton, Ill.—A new company has been chartered here under the name of the Clinton Dairy Products Co. The capital stock of the concern is $10,000.

Edwardsville, Ill.—A new concern to manufacture and deal in dairy products has been incorporated here with a capital of $60,000. The incorporators are: John A. Fruit, Louis C. Abenbrink, J. A. Buhrle, Martin Jensen, John G. Klueter.

Rockford, Ill.—The Cherry Valley Creamery Co., Inc., has been chartered here with a capital of $50,000, by Alfred Wessman, H. J. Credicott and Robert A. Moren.

Shirley, Ind.—Efforts are being made by the Shirley Chamber of Commerce to secure a condensed milk plant for this community.

Louisville, Ky.—Plans were filed with the building inspector for a modern fireproof addition to the Gray-Von Allmen Dairy plant, this city. The plans call for a new building, two stories and basement, the building to be of brick, concrete and steel with white porcelain brick for the interior finish.

Boston, Mass.—The New England Dairies, Inc., this city, has been incorporated to deal in dairy products and ice cream, with one thousand shares of stock at no par value. The officers of the concern are: James J. Leahy, president; C. T. Curran, vice-president, and James L. Leahy, treasurer.

Morton, Minn.—Earl A. F. Paulson of Stanchfield, Minn., has purchased the Morton Valley Creamery of this city. He will manufacture butter and ice cream.

Springfield, Mo.—The foundation work on the ne
of the Willow Springs Creamery Co., this city, is neari
pletion.

Winona, Miss.—At an enthusiastic meeting here t
ter of bringing a milk condensery to this city was di
A committee has been corresponding with the Pet M
of St. Louis.

Brigham, Utah.—If present plans under considera
the Boxelder Commercial Club and chamber of comme
velop, Boxelder county is to have a milk condensery
the near future. Secretary Lewis Jones of Boxelder
interested party.

Delavan, Wis.—James Haagenson has purchas
Krebs Dairy and equipment, this city, and will run th
under the name of the Standard Dairy.

Waunakee, Wis.—The Waunakee Milk Products C
installed a new 25 horse boiler recently and it is thei
tion to also install another skim milk vat in the ve
future to take care of their increasing business in
cheese.

Camden, N. J.—Work is progressing on the new i
ments of the Supplee-Wills-Jones Co. at 8th and Mar
Two units of a continuous-flow pasteurizing system
ing installed; a new can washer; enlarged ice box; a
ceiving room and many other improvements.

Highlands, N. J.—Peter and Harry Sigmund are
ready to pasteurize in their plant at Water Witch
Highlands.

Hoboken, N. J.—Keystone Dairy Co. has conve
three-tank continuous flow holders into a four-tank ba
tem, having made a good improvement in the system.

Paterson, N. J.—Paterson Milk and Cream Co.
Madison Ave. is making extensive alterations in i
plant. A new second floor pasteurizing room is one
features.

Pensauken, N. J.—Parks Dairies have established
pasteurizing plant at 116 North Forty-second St.

Three Bridges, N. J.—Fire destroyed the entire p
the New Jersey Milk and Cream Co. Fortunately, the
has another creamery at Flemington, four miles fro
fully equipped to pasteurize and bottle its product
decision to rebuild Three Bridges plant.

White House, N. J.—George Clark has installed th
vat pasteurizers to replace the former two-tank cont
flow system.

Woodruff's Gap, N. J.—Sisco Dairy Co. of Passa
taken over the operation of this creamery, it havin
idle several years. The milk will be received, cool
shipped in cans by rail to their plant in Passaic.

White Salmon, Wash.—P. Proper has purchas
Starrs building here with the intention of continu
dairy business on a larger scale. He will make nu
improvements and will occupy the new building about
first.

Huntington, W. Va.—Enos Taylor, general mana
the Huntington Creamery Co., this city, announced t
company is planning to expend $100,000 on a new pla
a daily capacity of 16,000 gallons. The site has no
decided upon.

Weston, W. Va.—Weston and Lewis counties are
cally assured of a milk shipping station, to be locate
according to J. A. Hodges of the Baltimore and Ohio R.

Beloit, Wis.—Fire which is believed to have been
by an explosion, did damage estimated at $50,000
Wright and Wagner creamery plant here.

will move the frame building from the present site and erect a new two-story brick building 55x65 feet thereon. New and modern equipment will also be installed.

Johnson Creek, Wis.—Purchase of a site at a cost of about $80,000 has been made by the H. C. Christians Butter Co., this city, for a butter storage building in Chicago, Ill.

Medford, Wis.—The Medford Co-operative Creamery Co. made a contract with the Ward Dry Milk Co. to sell its entire output of dried buttermilk during 1927 at 7½ cents per pound on board cars in this city, whence it will then be shipped to St. Paul.

West Frankfort, Ill.—The plant of the West Frankfort Pure Milk Co., which deals in milk, butter and cottage cheese, has been purchased by Sherman Boner.

South Haven, Mich.—A new building is being erected here by The Grove Dairy Co.

Vassar, Mich.—The Vassar branch of the Detroit Creamery Co., this city, is installing a condensing pan having a capacity of handling 8,000 pounds of milk per hour, which will almost double the present capacity of the plant. N. F. Englehart is the local manager.

Evansville, Minn.—It was decided at the annual meeting of the Evansville Co-operative Creamery Association to set aside a certain sum each month as a permanent sinking fund with which to be prepared to meet the need for expansion in the future and for a new building at such a time as there will be need for one. The board consists of the following: L. W. Roswold, president; P. H. Pederson, vice-president; H. R. Mahla, secretary; W. I. Erickson, treasurer; A. G. Olson, Art Christenson and Christ Johnson, directors.

Royal Oak, Mich.—A new dairy and ice cream manufacturing plant costing approximately $50,000 is being erected here by the Freeman Dairy of Flint, Mich. The plant is expected to be ready for operation soon, and will be of brick, steel and concrete. Leonard Freeman is the president and general manager of the company.

Clarksville, Tenn.—The Dunlop Creamery will erect a 60x80 ft. plant here and will install $50,000 worth of equipment.

Spencer, Wis.—Extensive improvements are being made at the plant of the Spencer Milk Products Company, this city. The milk storage capacity has been enlarged with the installation of two 25,000 gallon and one 10,000 gallon glass lined tanks.

Silverville, Pa.—R. W. Cramer & Sons have thoroughly remodeled their dairy plant here. They have installed electric high pressure bottle washers, automatic capper and filler, and also a refrigeration plant.

❦

BUTTER ADDS FLAVOR AND ENERGY TO FOOD.

"Nature has given butterfat a particularly appetizing and distinctive flavor found in no other energy food," according to nutrition specialists of the National Dairy Council. "This is logical in a food which was intended by nature to sustain and build youthful bodies.

"What is still more important, nature has placed in butterfat considerable amounts of Vitamine A, indispensable to child growth and adult health. Our body requires daily a supply of heat and energy food. Butter supplies this heat and energy in abundance in the most easily digested food fat. It is for this reason that cooks find their best dishes are made best with butter."

Built Especially For Retail Milk Delivery

DIVCO overcomes all the objections to power vehicles for delivering milk from house to house. It is not merely an ordinary truck with a special body; it is designed and built for only one purpose—that of delivering milk faster and cheaper than it has ever been done before.

Against Horses

Over 12 routes averaging 10½ miles and 180 stops, with an average load of 36 cases, the DIVCO Truck saved from ½ to 2 hours in delivery time, using only 1.2 gallons of gasoline per route and no oil.

Against Other Gasoline Trucks

In fifteen tests, conducted in different cities, against various makes of trucks, over routes averaging 26 miles, with an average of 140 stops and 31 cases, the DIVCO Truck saved from 1 to 2½ hours in delivery time, over 50% gasoline and 80% oil.

Against Electrics

Over twelve routes, averaging 22 miles and 210 stops, the DIVCO Truck saved from 1¼ to 2 hours in delivery time. Gasoline consumption averaged 2.3 gallons per route.

Divco handles easily, quickly, and quietly. The motor is governed not to exceed a maximum of 18 miles per hour which insures long life and low upkeep costs. The three point control permits the driver to operate Divco from the front or either side. Positive fool-proof brakes. Before you buy a wagon or ordinary truck, let us tell you more about Divco economy.

NEW JERSEY HAS NEW LAW REQUIRING TUBERCULIN TEST OR PASTEURIZATION.

On March 28, Governor Moore approved Assembly Bill No. 369 by Mr. Olden, which requires that all herds producing milk for public consumption in New Jersey must have successfully passed a tuberculin test within a year or the milk must be pasteurized or sold to a pasteurizing plant. The law takes effect January 1, 1928.

This is the third time this bill has been introduced in the New Jersey legislature and this year had the solid support of a number of official and semi-official agencies, including the state department of health and agriculture. It passed both houses of the legislature almost unanimously.

The object of the new law is to protect consumers of milk, especially young children, from contracting tuberculosis by the consumption of milk from tuberculous cattle. This disease exists in a large percentage of the dairy herds of the state. Children are susceptible to bovine tuberculosis, statistics showing that about one case in four of every child under five years of age having tuberculosis is of bovine origin. No protection was given under existing laws. The new law will give the public a choice between **unpasteurized** milk produced by cows known to be free from tuberculosis, or **pasteurized** milk in which all dangerous disease-producing organisms have been destroyed.

Following is a copy of the law:

A supplement to an act entitled "An act to secure the purity of foods, beverages, confectionery, condiments, drugs and medicines, and to prevent deception in the distribution and sales thereof" (Revision of 1907), approved May 20, 1907.

Be it enacted by the senate and general assembly of the state of New Jersey:

1. No person shall purchase, distribute or sell, or have in his possession with intent to distribute, sell or give away, for human consumption, any milk or cream which has not been pasteurized, except milk or cream which has been produced by cows which have successfully passed a tuberculin test within one year of the sale of such milk or cream; provided, however, that it shall not be unlawful to sell or deliver milk or cream produced by cows which have not passed a tuberculin test to a person or firm licenced by the Department of Health of the State of New Jersey to pasteurize milk or cream; and provided, that it shall not be unlawful to sell or deliver milk or cream produced by cows which have not passed a tuberculin test if an application for an initial test of such cows by the Department of Agriculture of the State of New Jersey under the laws of the state of New Jersey is on file with the department of agriculture.

2. In the case of milk or cream which is produced in states other than New Jersey, and which is shipped into this state for distribution and sale, all such milk or cream shall be pasteurized before being offered for sale, distributed or sold, or given away for human consumption, excepting that produced by cows which have successfully passed a tuberculin test within one year, made by a licensed veterinarian of the state where the cows are maintained.

3. All containers in which pasteurized milk or cream is shipped, distributed, sold or given away for human consumption shall be plainly marked with the words "pasteurized milk" or "pasteurized cream," as the case may be, upon the tags, caps or labels. All containers in which milk or cream from tuberculin tested cows, excepting certified milk, is shipped, distributed or sold shall be plainly marked with the words "unpasteurized milk produced by tuberculin tested cows," or "unpasteurized cream produced by tuberculin tested cows," as the case may be, upon the tags, caps or labels.

4. All tuberculin tested cattle producing milk or cream which is sold as "unpasteurized milk produced by tuberculin tested cows," or "unpasteurized cream produced by tuberculin tested cows," shall be made by veterinarians employed by the Department of Agriculture of the State of New or by licensed veterinarians. A complete record of th tuberculin test of each animal shall be kept on file premises where the cattle are maintained. Such r shall be open to inspection by state or local officials auth to make dairy inspections.

5. All cattle which have reacted to the tuberculin which are affected with any disease or condition whic render the milk injurious to health or abnormal in co tion shall be separated from the dairy herd, and no mil such cattle shall be sold, offered for sale or distribu given away for human consumption.

6. No cow shall be admitted to a herd producin intended for sale or distribution as "unpasteurized unless it has successfully passed a tuberculin test wi period of one year of the sale of the milk.

7. Every person who shall violate any of the provis this act shall be liable to a penalty of twenty-five doll the first offense and to a penalty of fifty dollars for the and each subsequent offense. Payment of a penalty f alleged violation of this act, either before or after the i tion of proceedings for the collection thereof, shall, f purpose of this act, be deemed equivalent to a convic the violation for which such penalty was claimed.

8. This act shall be enforced by the Departm Health of the State of New Jersey and by the local bo health of any municipality in this state, in the same m as the act to which this act is a supplement, and all pe incurred under this act shall be sued for and recove and in the name of the Department of Health of the of New Jersey, or by and in the name of any board of of any municipality in this state, in accordance with th visions of the act to which this act is a supplement.

9. This act shall take effect January 1, 1928.

DIRECTOR FOR SECOND TIME.

For the second time in as many years, Frank E derburg of R. R. No. L, National road west, was e as the Clark county director of the Miami Valle operative Milk Producers' Association, at the m held in Dayton, O., recently. Approximately 1,00 sons attended the meeting.

Mr. Funderburg, as director, represents approx ly 450 milk producers of Clark county at all legis sessions of the association. He is president of the County Farm Bureau.

An increase of 63½ per cent in the sales association for the year was reported. Sales in 192 $313,463, as against $191,708 in the previous yea pounds of butter, sales last year were 705,228, as a 419,687 in 1925, a gain of 68 per cent.

R. H. HUMPHREY CHOSEN PRESIDENT OF S FALLS MILK PRODUCERS' ASSOCIATIO

R. H. Humphrey was elected president of the Falls Milk Producers' Association, Sioux Falls, S. their annual meeting. He succeeds Dr. Fred Eva president.

Other officers elected were: Ralph Rogers, vice dent; R. F. Ross, secretary, H. H. Bement, treasure P. O. Moe, L. G. Lannis, C. F. Eggers and J. P. N directors.

S. G. BARTLETT CHOSEN PRESIDENT OF ST BURG MILK PRODUCTS CO.

Directors of the Steamburg Milk Products Steamburg, N. Y., held their annual meeting at the election of officers resulted as follows: S. G. lett, president; E. E. Bogart, vice-president; Jaquay, secretary and S. Fenton, treasurer. The tors of the company are composed of the following officers and M. L. Burdick, John Holt, F. C. Heier, Moore, L. E. Darling, E. L. Blood, George Patt Walter Barber, George Keith. Of these there were ent nine directors.

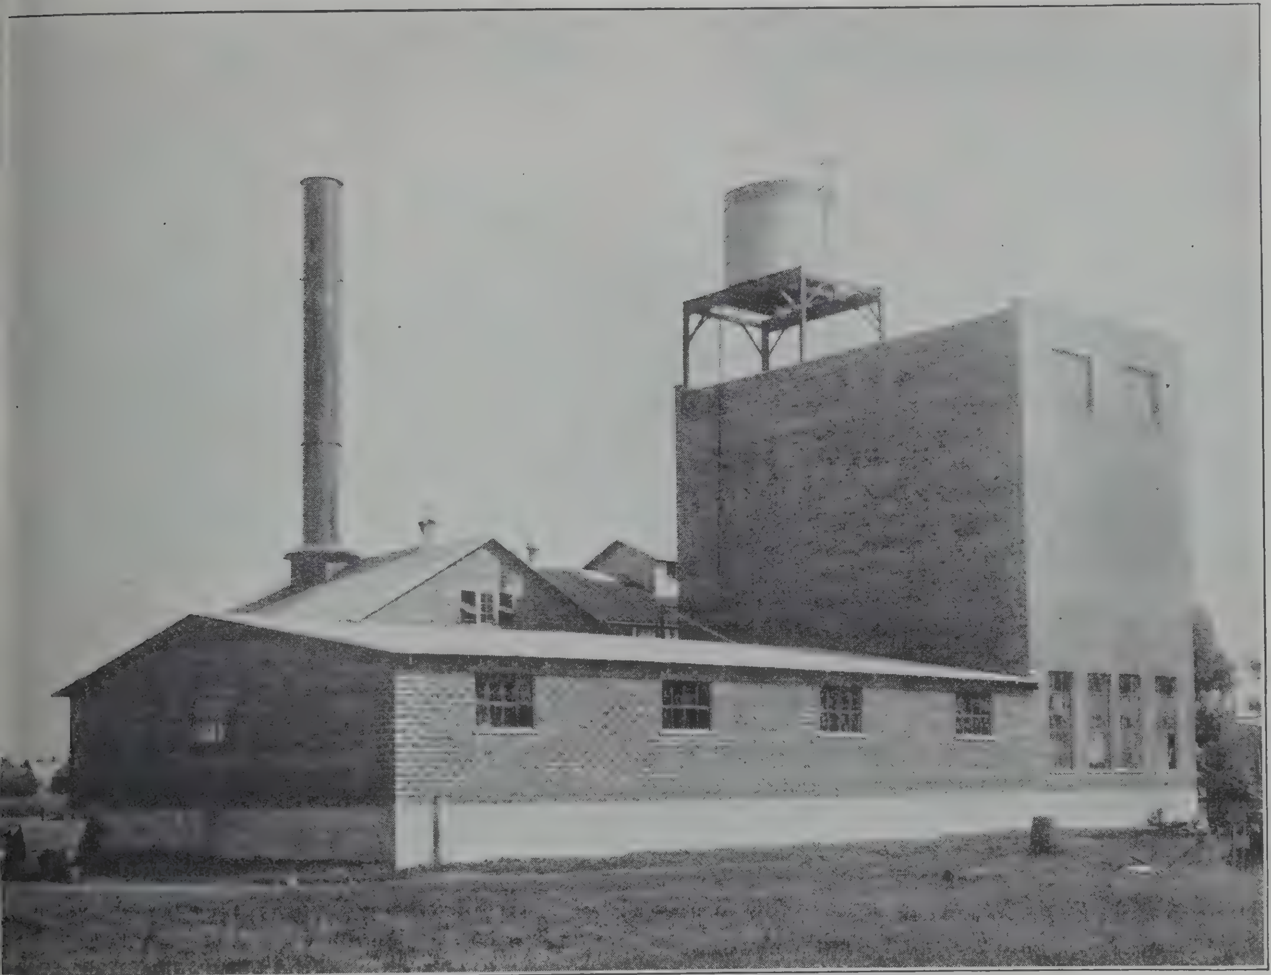
OUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

139 NORTH CLARK STREET, CHICAGO



Sheffield Farms Company's plant at Lisbon, N. Y.

PLANTS IN OPERATION OR UNDER CONSTRUCTION

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Building Demand for Milk Products

Relation of the National Dairy Council to the Dairy Industry and What it Means in Your Business. What Dairy Leaders Say About Its Work

FOLLOWING approval of a budget to increase the dairy industry's support of its educational organizations, at the annual meeting of the American Dairy Federation, which represents every branch of the industry, from farmer to market, a campaign is now being conducted among milk dealers, to inform them of the important work of the National Dairy Council.

In 1919, several leaders in the dairy industry met and formed the dairy council, with the idea that it should become the representative of the industry on a non-profit basis, to educate the public on the food value of dairy products, and to build good-will for the entire industry. The dairy council has grown since its start with surprising rapidity, and each year has found an increasing demand from the public and the industry for its services.

Up until a few months ago, the council had been supported by a relatively small proportion of the largest firms in the milk distribution branch of the industry, as compared with the amount of attention it has given to the direct increase in milk consumption. The dairy council has been supported from its formation by representatives of the butter industry, many ice cream manufacturers, by makers of dairy machinery and supplies, and by organizations whose membership include approximately 600,000 producers. Within the past few months the dairy council has been called upon to co-operate in the educational publicity program for the ice cream industry, through the research council of ice cream manufacturers. It has also been called upon to render added services to butter manufacturers of the Middle West, while producer organizations have added to their contributions for its rapidly expending program.

The present campaign to inform milk dealers more about the need for developing the dairy council's milk consumption work is the result of a series of meetings of leaders in the milk distribution branch of the industry. A committee of these men was formed to serve with leaders in the other branches of the industry, on a budget committee for the dairy council. Thus, all funds and efforts of the dairy council are presented in detail for approval. Not only has the American Dairy Federation approved the need of additional funds, but this budget committee voices an urgent awakening of milk dealers not now supporting the dairy council to its im work, and the need for increasing its effectivene

Local dairy council units, in larger cities, a supporting through definite funds created locally dealers and producers. Thus the entire funds of ational Dairy Council, in its Chicago office, are reach fully two-thirds of the population and fourths of the area of the United States, which th councils do not reach. At present the national attempting to cover this area on a smaller budg some of the local councils find necessary for a part state. In fact, the National Dairy Council now less in building increased appreciation of the pu dairy products than single milk distributing firms find adequate to advertise in its own market.

A sixteen-page booklet outlining the organizati activities of the National Dairy Council has be pared, and may be secured upon request. It is mailed to leaders in the industry, generally. The national Association of Milk Dealers has, thro executive committee, not only approved the dair cil's work but is urging its members to give activ cial support.

"It is estimated that the American public s 1925 of its food budget, FOUR BILLION DOLLA dairy products," states the council summary. T an increase over 1920 of about one and a half dollars. Each branch of the dairy industry was benefited by this increase in consumption, whi lowed educational endeavor and absorbed this in production.

"Leading dietary scientists declare that the States should be consuming at least fifty per cen dairy products than are now consumed, for best in health and efficiency. This should be our goal. must be provided for the effort. We owe it to the try. We owe it to the nation because our nationa perity and supremacy depend in no small degree products of this industry. There is a pressing d on the council for co-operation in health educatio ice that promises big returns for the industry. golden opportunity that this condition presents.

Leaders in each branch of the dairy industr

Folks Are Anxious to Know About Milk and Milk Products.

he need for milk dealers to see the value to their usiness in encouraging the educational work of y council, as a direct means of investing in future possibilities. Some of these leaders have ex- themselves as follows:

From the Milk Dealers' President.

National Dairy Council is doing splendid work in ng milk and dairy products generally. Their work is ing, building good-will for the dairy industry in a ther general agency touches. It needs and deserves e financial support of every milk dealer who is inter- the future development of his business."

F. H. KULLMAN,
President, International Milk Dealers' Association.

From a Recognized Educator.

e broad educational program which the National Dairy is now carrying on is contributing to the well-being hildren of this country and should be beneficial to the dustry as well."

CLAIR E. TURNER, C. P. H.,
Associate Professor of Biology and Public Health,
Mass. Inst. of Tech.

The Kiddies Know What's Good for Them.

From a World-Wide Authority on Nutrition.

"I have been familiar with the character of work being done by the National Dairy Council for several years, last past. It is fundamental in character and sound scientifically, and is undoubtedly accomplishing a great deal of good for the dairy industry, as well as being a distinct contribution to health educational work. It is incomprehensible to me why the dairy industry does not support the work of the council organization in the biggest financial way possible."

DR. E. V. McCOLLUM,
Professor of Chemical Hygiene and Public Health, Johns Hopkins University, Baltimore, Md.

* * *

From Creamery Buttermakers.

"WHEREAS, Through lack of information of the dietary value of butter on the part of the public, the per capita consumption is considerably lower than is warranted, and, Whereas, In the National Dairy Council we have an organization which has demonstrated its ability to bring about an increase in the consumption of dairy products, be it Resolved, That we urge our members and the creamery industry as a whole to provide the National Dairy Council with ample funds to conduct a butter publicity campaign which will acquaint the consuming public with the merits of butter to the end that the per capita consumption may be increased."—1926 Resolution of National Creamery Buttermakers' Association, Sioux Falls, S. D.

⁂

REEDSPORT, ORE., RESIDENT OBTAINS PATENT FOR NEW DEVICE.

G. O. Walker, a resident of Reedsport, Oregon, has recently secured a patent for a device, which he invented, to securely fasten the lids of milk cans.

This device is so constructed that it prevents loss of milk or cream while it is in shipment and also prevents the adulteration of the contents while the cream is in transit, and also prevents the interchanging of lids of the milk cans.

Through the use of a piece of steel wire, a small metal loop, a hollow bolt, threaded on the steel wire, and fastened to the milk can lid, the device is complete. It is not complicated and is easily manufactured.

⁂

ANOTHER EXAMPLE OF BENEFITS DERIVED FROM COW TESTING ASSOCIATIONS.

A. C. Baltzer, dairy inspector with Michigan State College, told members of the Oakland County Cow Testing Association, Pontiac, Mich., that through the work of cow testing associations, Allegan county dairymen have increased the annual product of their cows by 3,000 pounds of milk and 100 pounds of butterfat.

⁂

Cowards do not sound in battle; they are there, but not in it.

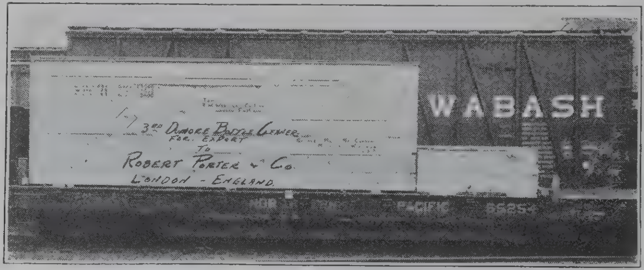
Notes of the Trade

EXPORT BUSINESS STEADILY INCREASING.

Announcement was made recently by the Geo. J. Meyer Co., Milwaukee, Wis., that three Dumore bottle washers have been purchased by Robert Porter Co., London, England, through the Milwaukee firm's English agent, R. W. Webster Company.

The Geo. J. Meyer firm announces that its export business is steadily increasing and that Schweppes, Limited, Vauxhall, England, which firm is operating two Dumore Junior bottle cleaners, recently placed an order for a third machine, which is to be shipped in the very near future.

The R. W. Webster Co. also has cabled Meyer to prepare a 308-quart Dumore for shipment April 15.



Dumore Bottle Washers Enroute to England.

The Meyer Co.'s French representative, R. I. Lecomte, Paris, France, is also making rapid strides in establishing the Dumore in France, it is reported. He now has three large Dumore units at Societe Generales des Faux Minerales de Vittel, Vosges, France; Felix Potin, Pantin, (Seine), France; Establissement Richelieu, Vichy, France, and at Rene Robert, Paris, France.

The tremendous savings and wonderful results obtained from these machines have attracted the attention of the largest wineries throughout France, it is announced.

Far-off Australia has also added its endorsement of Meyer-built equipment. Marchants Limited, of Melbourne and Sidney, are operating four large Dumores, the last one being recently shipped to them for their Melbourne plant. Schweppes, Limited, of Sydney, are operating two Dumores.

Recent shipments of Dumores were made to Castlemaine Brewery, Brisbane, (Queensland), Australia, and Coulson, Hay & Company of Melbourne. Coulson, Hay & Company have also just cabled their order to Meyer for a 20-bbl. Meyer floor type Regenero pasteurizer.

Present indications are that the Dumore bottle cleaners will soon be found in every country throughout the world where bottle cleaners are in demand.

NOW AVAILABLE IN TWO SIZES.

The Douthitt Engineering Company is now offering their spray drying plant in two sizes, the latest having a capacity of from ten to twenty-five thousand pounds of fluid daily of any or all of the following products: Whole or skim milk, buttermilk and whey. (No "wash-up" between products necessary.) This equipment was formerly offered in one size only, having a capacity of from thirty to seventy thousand pounds fluid daily and the new size, equally as efficient as its "big brother," is especially designed to meet the requirements of creameries, milk plants, cheese factories and milk distributors whose receipts do not attain the voume of the larger factory.

INTERNATIONAL ASSOCIATION OF MILK DEA ANNOUNCE STANDARD FITTING FOR GLASS LINED TANKS.

Readers of The Milk Dealer recall the announceme about a year ago of the adoption by the manufactu temperature instruments, and the International Associ Milk Dealers, of the standard thermometer connect vats, and that the joint committee of these two gro pected to announce the standerd thermometer fitting f lined tanks soon thereafter.

Several meetings between the International Comm Standardization of Equipment, under the leadership Forster, Pure Milk Dairy, Ltd., Hamilton, Ont., and resentatives of the temperature instrument manuf followed with the result that on January 18, 1927, t vote of the manufacturers was recorded for adoptio standard fitting for glass lined tanks.

While the standardization of the thermometer co for glass lined tanks does not affect as large a grou that for vats, nevertheless the committee feels that important piece of work has been accomplished.

This is a big step forward in that it insures inter ability of competitve makes in thermometers. This i distinct achievement, and only another of the numbe complishments that has been effected by the Inter Association of Milk Dealers through its committee o ardization under the leadership of Mr. Forster.

The work that has now been accomplished to date i did co-operation afforded by the manufacturers consist the absolute simplification of the sanitary pipe and fitt that all sanitary fittings are now interchangeable an same thread and diameter for different sizes; (2) the fication affording interchangeability of sanitary therm connection for vats, and (3) the simplification affordin changeability of sanitary thermometer connection f lined tanks.

The Standardization Committee of the Internationa ciation of Milk Dealers consists of W. H. Forster, Pu Co., Ltd., Hamilton, Ont.; F. E. Goldsmith, Borden' Products Co., New York, N. Y.; M. Van Antwerpen, Dairy Co., Milwaukee, Wis.; O. S. Schier, Western M Dairy, Inc., Baltimore, Md., and T. N. Westlake, Farms Co., New York, N. Y.

Dealer" Want Ad.

CREAM SHIPMENTS FROM CENTRAL WEST TO NEW YORK CITY LARGE.

According to a recent report issued from New York City, the shipment of sweet cream from the Central West to the eastern centers of population is becoming an important factor in the dairy industry. From January 1 to March 15, Wisconsin creameries shipped 5,178 cans while Iowa provided 1,600 cans for the metropolitan supply. The other Middle Western states to market cream in New York City during that period were Ohio, with 800 cans, and Indiana with 445 cans.

⁂

NEW PLANT COMPLETED.

The new plant of the Purity Milk Company, Philipsburg, Pa., is now completed, with the new machinery installed and running smoothly.

The cost of the building, of brick and concrete, and the machinery represents approximately $18,000. The members of the company are Orvis and Earl Fleck, who have been in the dairy business for years, taking over the business of their father, the late John Fleck, who was a well known dairyman.

Four hundred gallons of milk is purchased daily from farmers in the region.

⁂

BILL WOULD SHACKLE GROCERY CLERK'S WIT.

Not that the Wisconsin senate would put a ban on wise cracks thrown at unsuspecting customers by grocery clerks, but a bill introduced at a recent session at Madison, Wis., would act as an effective curb. No longer would the question, "May I have a cup of milk?" elicit the reply, "Shall I break the bottle, or wrap it up?" The new bill asks for the standardization of one-third quart bottles, because "pints are often too large and half-pints too small."—Milwaukee Journal.

⁂

PAGE MILK COMPANY EXPANDS INDUSTRY.

The Page Milk Company, Merrill, Wis., has expanded its industry considerably by the completion of a new fire-proof daylight addition, 65 by 85 feet, one-story and basement, and by the installation of considerable new machinery. The improvements have been made with the expectation that the daily milk deliveries to the plant will aggregate from 120,000 to 125,000 pounds this summer.

The plant will also be equipped with an additional 150-h.p. boiler for the purpose of raising more steam. A new 30-ton ice machine is also being installed.

NEW HOME FOR MILK FIRM.

The Vandello Bros are the proprietors of the
man-Wilson Milk Co., which recently moved into it
location at 1107 East Main St., Ottumwa, Ia.

The milk furnished by this company is pasteuriz
the most modern scientific methods, which kills the l
ful bacteria and renders the milk safe without des
ing the food value. "Bottled, pasteurized milk may
a little more than raw milk, but it is well worth th
ference in price," say officials of the firm.

⁂

FIRST PRESIDENT OF CHICAGO MILK SHIPP ASSOCIATION PASSED AWAY.

Judson P. Mason of Elgin, Ill., who was the first
ident of the Chicago Milk Shippers' Association,
which grew the present Milk Producers' Associa
and also president of the Illinois State Dairymen's
ciation for twelve years or more, died recently at th
of 77 years in his farm home that was his birthplace
the home of his father who got the land as a govern
grant in 1845.

⁂

DRINK MILK FOR ROSY CHEEKS, GIRLS

Mrs. Scott of the Pittsburgh Dairy Council addr
the girls of the seventh and eighth grades of the Ho
School, Philadelphia, on "Painted Faces, From th
side Out."

Mrs. Holmes said not by artificial means, such a
use of paint, powder and lipstick, can one be r
beautiful, but by natural means, such as adopti
proper diet, which includes milk, thinking right thou
and adopting regular habits.

⁂

NEW DRY MILK PLANT.

The new plant of the Dry Milk Company, New
City, which is being erected at Jasper, Mo., is sched
to be in operation this summer. The plant is being
signed to make dry whole milk which is used by m
facturers of the finest grades of milk chocolates, and
skimmed milk used for a variety of purposes.

The new plant will have a capacity of upwar
60,000 pounds of liquid milk daily and is so desi
that its capacity can be increased as may be requir
handle the growing milk production in the vicinit
Jasper.

The Dry Milk Company's products are mark
under well advertised trade-marked brands as foll
Cremora—dry whole milk; Milcora—dry skimmed m
Chicora—dry skimmed milk; Dryco—infant milk.

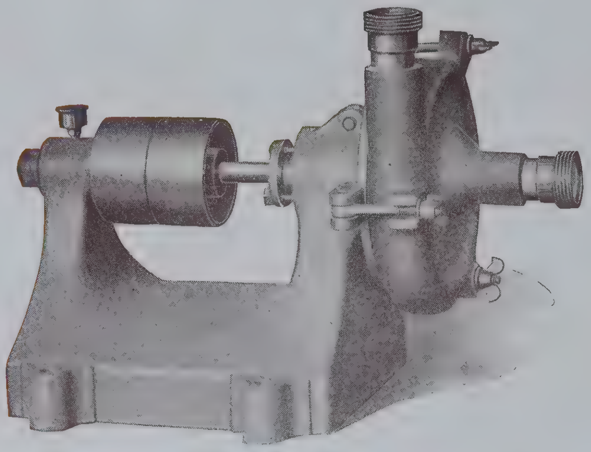
"FOR BETTER MILK HANDLING"

The YORK Milk Pump is made in No. 1, No. 2 and No. 3 sizes and in either belt drive or direct motor drive.



Belt driven pump assembled.

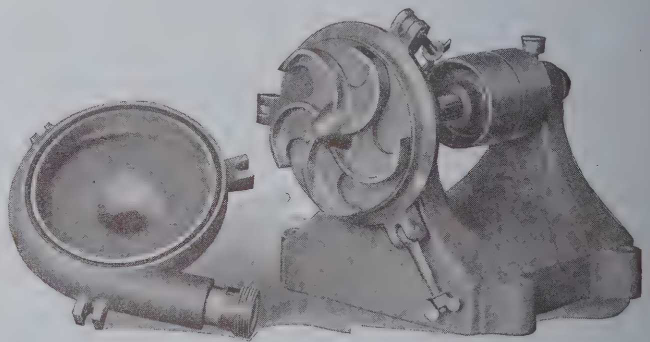
YORK No. 2 Milk Pump

A PUMP which can be cleaned easily and thoroughly is a boon to the dairy. That is what you will find in the YORK No. 2 Milk Pump.

By loosening three thumb nuts, you are able to clean every inch without any guess work. There are no cracks or crevices which are hard to get at.

It has an oilless bearing at the impeller end, and a shaft made of 70% nickel. All castings are brass heavily tinned with pure blocktin. Regularly furnished for 1½ inch sanitary tubing connection. May be had direct connected to motor or belt driven.

The illustration shows the belt driven pump.



Belt driven pump taken apart.
Note easy access for cleaning.

Honor

The Ladewig-Soelch

SUPER EIGHT

HONORS! Scarcely six months old, this new Ladewig-Soelch has become the most talked of bottle washer in the industry. Yet this phenomenal success is logical. For behind the Ladewig-Soelch are the successes of 22 years in building washers—each one better than the last. Never has any washer been received with such enthusiasm and tribute; and all who have seen it agree on this: The Ladewig-Soelch is truly a remarkable engineering achievement. It has won its honors by sheer superiority and its outstanding ability to wash bottles faster, cleaner and *cheaper* than they have ever been washed before. Write for full information.

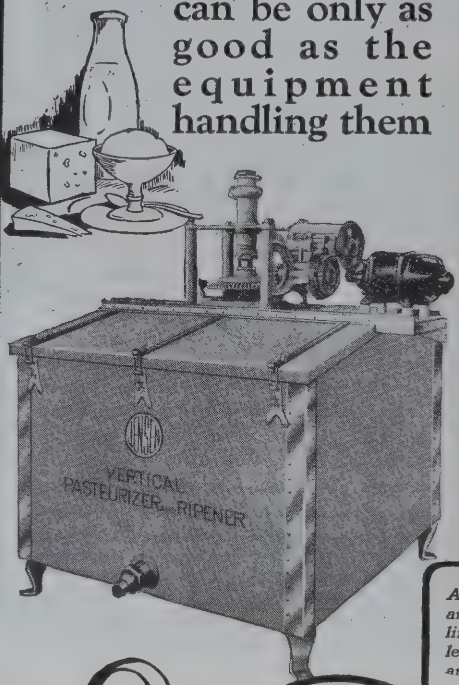
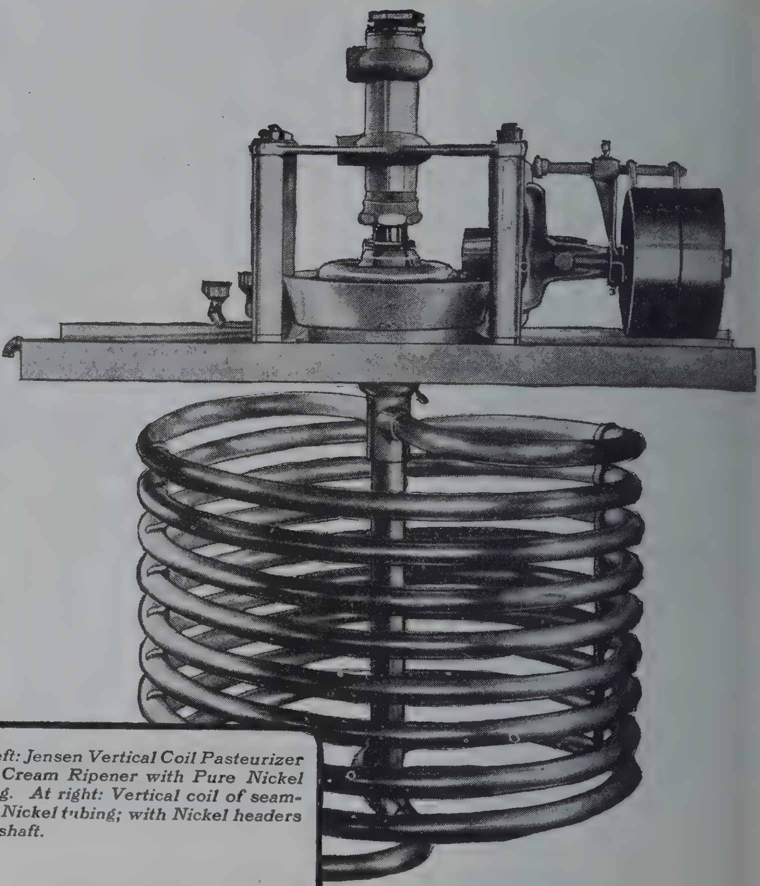
Dairy Products

can be only as good as the equipment handling them





At left: Jensen Vertical Coil Pasteurizer and Cream Ripener with Pure Nickel lining. At right: Vertical coil of seamless Nickel tubing; with Nickel headers and shaft.

So JENSEN has adopted Pure Nickel

THE goal of the dairy industry is the increased consumption of dairy products. Authorities say that this expanded volume of business will come with a better product—a product handled in better equipment.

Realizing that conditions call for a metal that is easily cleaned, yet strong and durable, we have adopted Pure Nickel for the coils and linings of our quality line pasteurizers.

The same properties that make Pure Nickel the SAFE metal also make it the ECONOMICAL metal for dairy equipment; for it combines long life and easy cleanability.

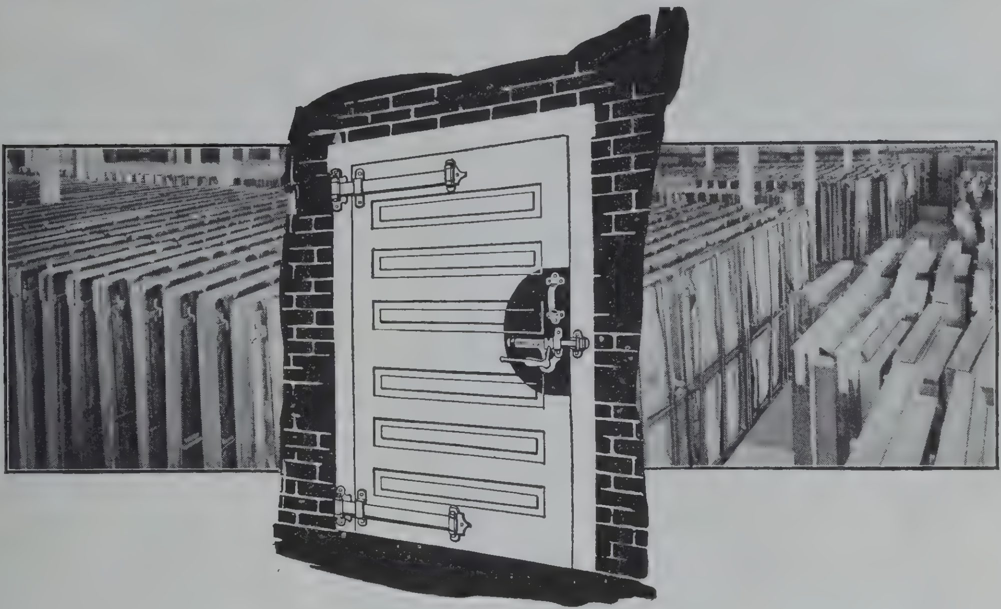
Why Jamison prices are as low as they are



THERE are Cold Storage and Freezer Doors that
are "cheaper" (selling price alone considered)
than Jamisons. But there could not be a door
qual" to a Jamison at *less* than the Jamison price.

viously, economizing in design—in materials—in
rkmanship—can bring down the selling price of
ler doors. But in *Jamison* Doors, the economiz-
; is present *only* in the fact that we turn
t mass production. There is no skimp-
; of insulation or of hardware; no sub-
tution or hurrying at any point. If we
re making only one door at a time in-
ad of one hundred, we could not make
at one door any finer than we actually
ke each one in our volume lots.

nsequently, each Jamison Door is the
est that a group of seasoned craftsmen
produce. Consequently, too, each
mison price is lower than could be of-
ed elsewhere—even if doors of equal
quality were produced anywhere else. The simple reason is that Jamison—outselling the output of all other cooler door manufacturers combined—enjoys unequalled, cost-lowering, *volume* advantages.

There are more Jamison Doors in use—there are more Jamison Doors bought year after year—than all other makes of Cooler and Freezer Doors put together.

Jamison Doors
Jamison Cold Storage Door Co

Write—*right now*—for our new catalog No. 13. It brings you complete information on Jamison Cooler and Freezer Doors, Automatic Ice Chutes, and other Jamison protective products.

When you buy a Jamison, you are certain of getting the utmost *proven* protection per dollar invested. When you install a Jamison, you are increasing the value of your plant with a door which, under normal conditions—and even worse than normal conditions—will serve perfectly, perpetually. When you order a standard Jamison Cooler or Freezer Door, your shipment is made promptly from our large *ready-to-ship* stock. When you order a *special size* Jamison Door, you command the facilities of a highly organized plant in position to give special orders *special attention*.

Dependable for Every Cooling Requirement!

Dependable refrigeration is indispensable to the successful handling of dairy products. No other industry demands a more certain and continuous temperature control for profitable operation.

Lipman is the tried, tested and perfected refrigeration for every dairy requirement. A setting of the thermostat and the Lipman functions automatically, keeping the temperature exactly where needed. An occasional oiling is all the attention needed.

Dairy operators are installing Lipman Refrigeration in greater numbers than ever before because of its dependable, full automatic performance.

Far superior, yet its cost of operation is but one-third to one-half as much as ice refrigeration.

Write or use coupon below for full information.

A size for every service.

Compact, "Space saving" design.

Soundly engineered and soundly built.

Full automatic, silent operation,—thermostat controlled.

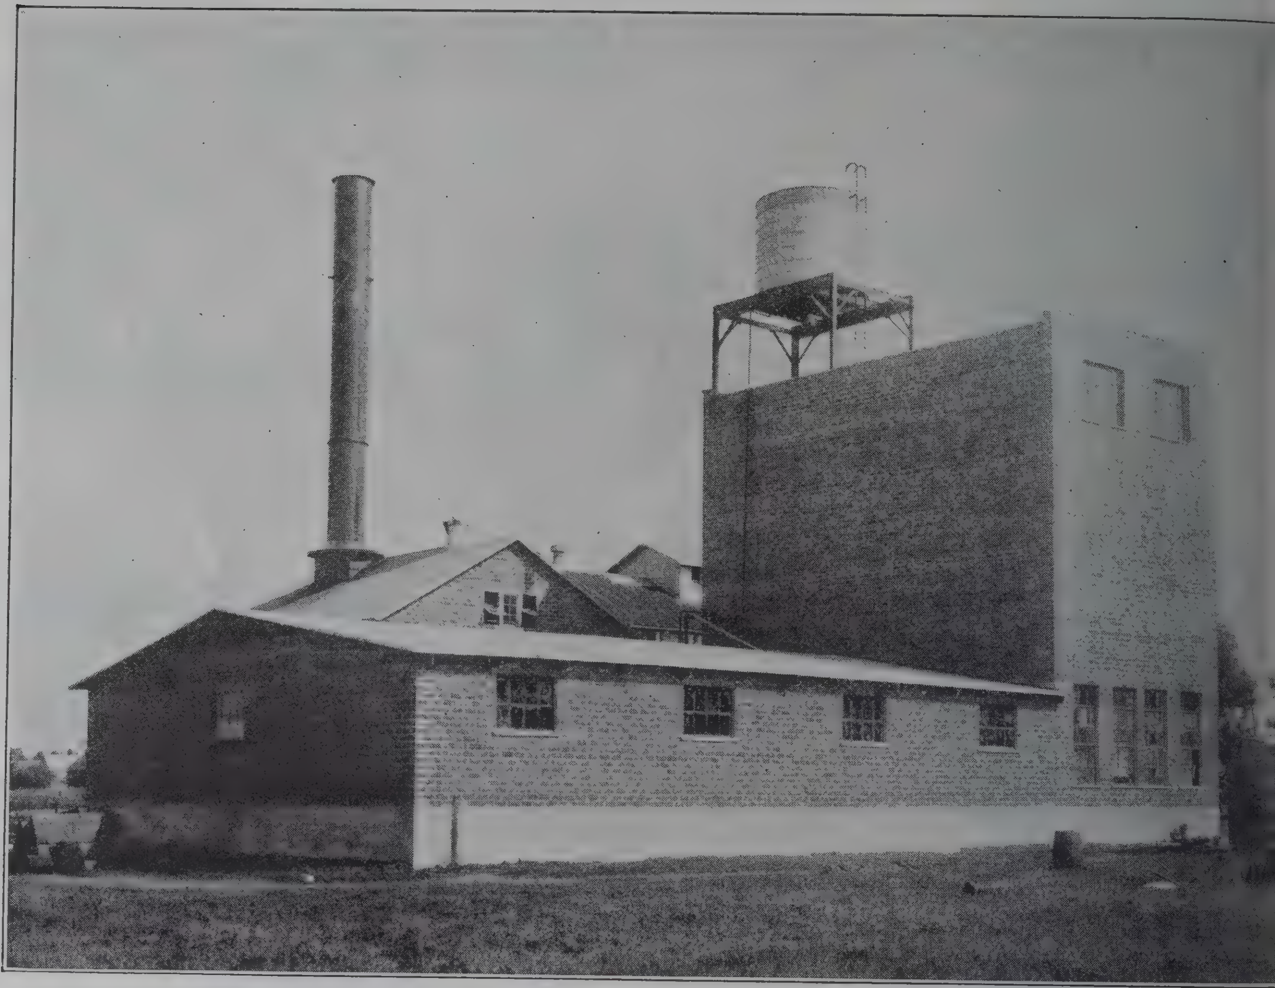
GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

100 WEST MONROE STREET, CHICAGO



Sheffield Farms Company's plant at Lisbon, N. Y.

43 PLANTS IN OPERATION OR UNDER CONSTRUCTI

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Tycos Recorders on Storage Tanks

Here are twelve *Tycos* mercury actuated temperature recorders installed on the storage tanks of a large Eastern manufacturing company.

They keep faithful record of every fluctuation in the temperature of the stored milk. After long periods of use they check accurately with test thermometers when they are inspected. They are rendering the *Tycos* service which we built into them and which by experience milk dealers and superintendents have grown to depend on.

If you plan additions to your temperature equipment, be sure to send for *Tycos* Catalog Part 500-A for milk plants. In it you will find a *Tycos* or Taylor temperature instrument for every milk plant need.

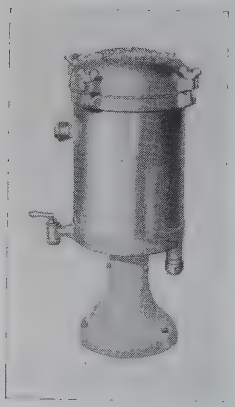
Honest Values—Are These Three Popular Cherry-Bassett Products

Bestov Filter



No. 1 Bestov Filter

THE Bestov Filter is the choice of most milk dealers because—

It removes dirt efficiently and dependably without great expense, and without injury to cream line.

It supplies more filtering area per dollar of cost than other filters.

Cloths may be exchanged at any time without disconnecting pipes or waiting for liquid to strain through.

The Bestov Filter is constructed in a very superior, substantial manner, insuring years of service.

Made in four sizes

No. 0	— 2400 lbs. per hour	**$75.00**
Junior	— 4800 " " "	**125.00**
No. 1	— 8800 " " "	**200.00**
No. 2	— 17000 " " "	**300.00**

Write for Bulletin 2408-R.

Can Sterilizer

THE Bestov Can Rinser and Sterilizer is a wonderfully efficient device for can cleaning where comparatively few cans are handled. It is very easy to operate, and economical as well.

The cans, either milk or ice cream, are inverted over the basin top while an application of hot water, and then steam through the jet nozzle, is made by operating the foot pedals. The cans receive a thorough scalding, rinsing and sterilizing steam bath.

Built to last a lifetime—frame is of hot galvanized cast iron, and all valves are made of solid bronze.

Price $45.00

BESTOV BOTTLE FILLERS

Bestov Bottle Fillers are made in a range of sizes that will completely take care of the needs of the average milk dealer.

Crate fillers are regularly made in 4, 9 and 17 valve sizes. Then there is the single valve hand filler which is a great convenience for bottling cream, nursery milk, buttermilk and for emergencies.

Only materials of the best are used to build Bestov Bottle Fillers. Tanks are made of heavy copper, thickly tinned. Frames are substantially constructed of galvanized castings, enameled on all surfaces. Bestov Filler valves will never leak. Each valve is factory tested with fifty pounds pressure. The valves and valve seats are ground in. They fill the bottles perfectly, with no drip.

Such features make Bestov Bottle Fillers a source of great satisfaction to owners everywhere. They are an ideal investment for the milk dealer who does not want to go to the expense of power fillers.

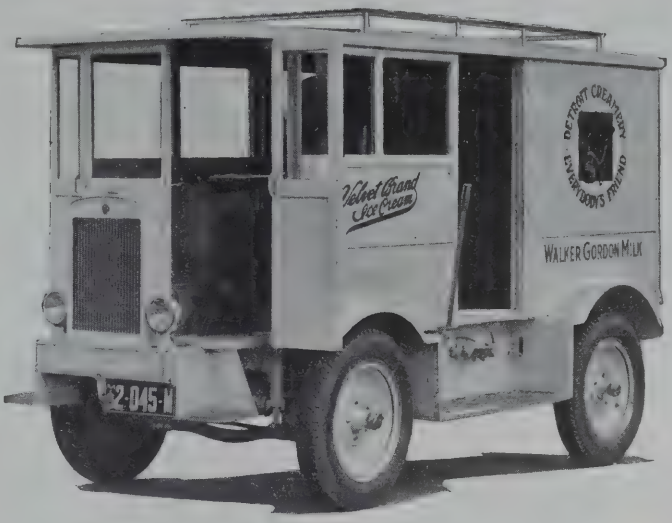
DIVCO

MOTOR TRUCK



Front Side View

because

its powerful, silent industrial type motor is governed to 18 miles per hour, eliminating any possibility of speeding, which is responsible for accidents, excessive wear and tear, rapid depreciation and heavy repair expenses. All parts subjected to strain are made over size. Quick action brakes are positive and fool-proof. DIVCO Trucks can be driven from the front seat or either running-board, easily and safely, a new departure in operation that saves hours in house-to-house delivery. The specially designed body has a capacity of 50 cases, all of which are accessible, thereby facilitating the delivery of your milk.

Its advantages over other delivery vehicles have been demonstrated very forcibly.

Against Horses

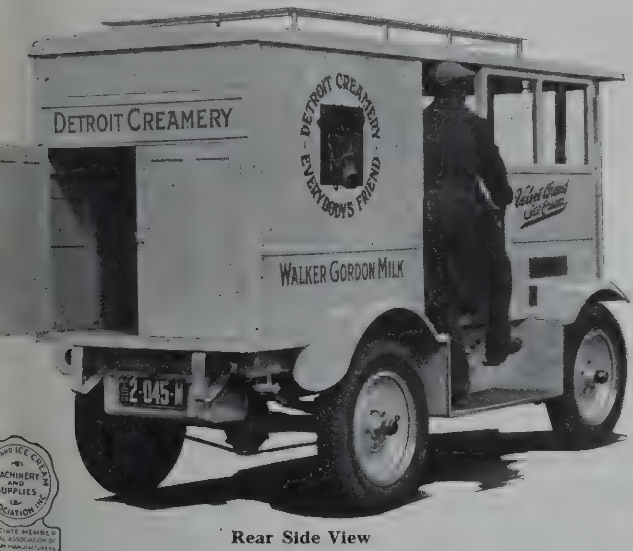
Over 12 routes averaging 10½ miles and 180 stops, with an average load of 36 cases, the DIVCO Truck *saved* from ½ to 2 hours in delivery time, using only 1.2 gal. of gasoline per route.

Against Other Gasoline Trucks

In fifteen tests, conducted in different cities, against various makes of trucks, over routes averaging 26 miles, with an average of 140 stops and 31 cases, the DIVCO Truck *saved* from 1 to 2½ hours in delivery time and over 50% gasoline and 80% oil.

Against Electrics

Over twelve routes, averaging 22 miles and 210 stops, the DIVCO Truck *saved* from 1¼ to 2 hours in delivery time. Gasoline consumption averaged 2.3 gallons per route.



Rear Side View

DIVCO Trucks will cut down your delivery costs by reducing the number of units necessary to cover your routes, (one DIVCO superseded *two* one-horse wagons, eliminating a driver and one wagon, and covered both routes in less time), saving time in delivery and allowing more time for collecting and soliciting new business and by reducing upkeep costs to a minimum.

Your enquiry for further particulars will not obligate you in any way.

Burrell-Simplex Spray Pasteurizers Are Leading the Field Decisively

NOW more than ever, Burrell-Simplex Spray Pasteurizers are enjoying a place of leadership in the Dairy Industry. Milk plants everywhere are manifesting decided preference for them—are voluntarily expressing their satisfaction with the wonderful efficiency of this coilless pasteurizer.

The gentle agitation produced by broad, slow moving paddles is unapproached by other types of agitation. Spray pasteurizers have from 25% to 50% greater area of heating surface. The big volume of heating water sprayed against this larger surface permits the use of temperatures of 160 to 165 degrees or lower.

Perfect agitation, absence of foam, low heating water temperatures, cleanliness, economy of operation, and many other advantages makes the Burrell-Simplex the finest and most efficient of all spray pasteurizers. You'll do well to get all the facts about this ideal pasteurizing equipment.

WIDER RADIUS

Your business requires delivery units that cover a longer radius with greater economy and absolute certainty. Walker Electric Truck Model 10 meets these requirements in a manner that puts it beyond competition.

Its economy — in initial investment and in operation — is extraordinary. Its perfect construction, based upon parts recognized for high quality, gives it a radius that will cover many a route where a gas truck is now required. It handles loads of 1000 to 1500 lbs. more economically than any other available unit. Its trouble-proof simplicity and all-weather reliability enable the driver to dress and act the part of salesman and active business builder on every route.

New folder, showing Model 10 Walker trucks which leading companies have already added to their delivery fleets—on request from any Walker branch or dealer.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

MAY DAY used to be a day to start a riot. It was this way this year, a riot of frolic for little children celebrating child health. The milk bottle is America's national Maypole.

The gentlemen with the long hair and the long faces and the red flags do not like this new turn of events, but they have just been crowded out of the picture by celebrants of dairy health. Another victory for the dairy cow.

It is easy to understand how radicalism, violence and the spirit of bloodshed cannot survive in the presence of an atmosphere so wholesome, so clean and vigorous as that of child health. This nation will never have cause to worry about bolshevism, nihilism, or any of the other "isms" that plague other nations. A nation giving so much thought to health, to clean, vigorous, wholesome activities, need never have any fear of this kind of social disease. Healthy people are happy and contented, believing in themselves and their nation.

Milk, therefore, is an important factor in political economy.

A DAIRY-MINDED people, we feel sure, will
disturbed by the oft-repeated fears of a satu
point for this industry in America. It just happen
the finite mind cannot easily grasp the bigness of a
nation's appetite—appetite not only for food, inc
milk and other dairy products, but appetite for
imaginable kind of commodity.

This is a young nation, a healthy, growing

milk men seem to think that the essence of sound ıship is comprised into very general propositions — proposition that milk is a valuable food, and second r milk is the best milk.'

long ago I was in a large city in the Middle West as amazed at the selling job that was not being done the milk distributors. There are several large and sperous dealers in that city. One of them has what lered to be one of the finest milk plants in the United Nevertheless, not only the advertising but the sales ot only of that dealer but of all his colleagues in the siness seems to be based entirely on adjectives. The pages of the telephone book proclaim in the most fashion that one man's milk is 'better,' another man's 'fresh,' still another one is 'better than the best,' or than the freshest' or some such term as that.

one single milk dealer has the vision of standing his on up on its own feet and selling it to his public on merits. They all seem to think that good salesmanısists not so much in telling what your own mer- or service does for the people who pay the bill, but n drawing or at least suggesting a comparison with e other fellow may or may not be doing.

onder why we couldn't have a constitutional amendmiting the use of adjectives in milk advertising to of one per cent?"

correspondent emphasizes a sore need of the milk ıting business when he points out the advantage ıg milk instead of "Jones'" milk. As our readers it is almost a hobby with us and we don't intend riding it. Getting customers away from the other is not selling milk. Getting customers to use more real milk salesmanship.

friend asks whether we intend to keep our al staff pressing this sales idea. When we get o stop publishing The Milk Dealer we will then be to quit talking about milk sales and milk adver- We feel that it is the most important problem ıting the milk distributing industry.

re was a time when problems concerned with peration demanded first attention. How to pro- bottle of good milk was the question uppermost minds of milk bottlers. That time, we believe, . The quality question, to be true, is still im- t, but most milk dealers know what they must do re high quality in their product. How to increase mand for their product is something else.

ciency in operating a milk bottling plant is also ing else. How to produce and distribute a bottle d milk at the lowest possible cost is an ever pres- blem. That is the reason we give so much space

se two problems—plant efficiency, including dis- on, and milk sales—are the two big ones in the listributing business. They will continue upper- n the minds of "our staff."

* * *

I just had the capital—." How many times have ou ever heard that remark? It has been uttered requently in the milk business and we, too, must s having once held some foolish thoughts of our s to what could be done with a little capital.

is true that some men could accomplish more if had a little more financial support, but just the if you question some of the great leaders in the business today you doubtless will find many of them firmly agreed that the best thing that ever happened to them was the utter necessity of working hard on a narrow margin.

There's something about money not good for human beings, not good for the most of us, anyhow. Every now and then you may find a rare individual that can safely handle money—but not often.

To be able safely to handle money means you must have the character to keep putting your whole heart and soul into your institution, with long hours of work and thought, even though you may have a little money at hand to tide you safely over the rough spots now and then. Money slows us up. It softens us up. It reduces that Divine fire of push with which ambitious men bowl over their obstacles. It kills off that superb spirit of fighting it out at all odds—the sort of spirit, you might say, that Grant had when he said he intended fighting it out along certain lines "if it takes all summer."

Very often the man who sighs, "If I just had the capital," really has more in his favor than have men with many thousands of dollars to their credit. For the chances are that the man without the capital, if he has the right sort of stuff, is going to keep plugging until he gets his business on a firm footing through NATURAL GROWTH—not artificial development.

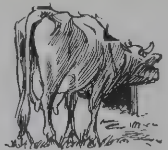
The man going through the fight can't always see things that way, but some day he will, just as some of our friends who have come through the same harrowing rat-hole that scraped off nearly all the hide.

* * *

MANY so-called "secrets of success" have been exploited, but most any successful business man understands there is no secret to it; it simply means gettings things done for you. The men who are getting ahead in the milk distributing business are those who are helping their salesmen get things done and there is where real business comes in—getting things done. The milk dealer must plan. There are too many men in the business that are just letting milk be delivered while they spend much of their time keeping up with things that bookkeepers and good stenographers should be doing. Men who drive milk wagons used to be called drivers. Some distributors still refer to their distribution agents in this way; others call them salesmen. They, too, however, are helping to make their men real salesmen.

We need more of the sales trend in the milk business. By this we mean that there is not enough of the spirit of the game, the urge to do something, besides the ordinary routine of the route. Comparatively few dealers are doing what they might to instill sales interest in their route men. No other industry is so favored by what the newspapers call "free advertising" as the dairy industry. Of all the branches of that industry the milk business gets more of it than the others. All the advertising that is done, however, free or otherwise, is not with full effect until it is hitched up with aggressive sales methods.

Milk for Every On



By
THURMAN B. RICE, M. D.

Assistant Prof. Sanitary Science and
Indiana University School
of Medicine

SOME folks claim that milk doesn't agree with them, and that they cannot drink it without suffering from this or that discomfort or disagreeable symptom. If milk dealers could overcome this rather common belief they would considerably increase the number of milk users, and the amount of milk used, all of which would be to the interest of the milk industry and the public as well.

Milk men should be able to answer this very common argument, and show wherein it is false if it really is false, or how some other milk product may be substituted in such a way that the trouble might be avoided. Many folks who think that they cannot drink milk are really badly in need of it, and could take it if they were only straightened out mentally on the subject.

It would seem strange if Nature's ideal food were poisonous to any large portion of the population. Milk is very rich in vitamines and mineral salts. Weakly folks are particularly in need of these substances. Milk is very easily digested as a rule (if not as sweet milk then in some other form), and it is the easiest excreted of all protein foods. It contains a large amount of liquid or water, and it is well known that doctors are constantly telling us to drink more water. The very folks that say they cannot take milk are the ones that need it most in more cases than not.

The commonest complaint is that milk is constipating. The propriety of this criticism depends upon the definition of constipation, and that is an intricate subject needing a long and rather technical discussion which cannot be gone into in this place. The reason milk has the reputation of being constipating is that milk and milk products are completely digested and absorbed. They leave no residue in the bowel. There is not enough roughage in it. There is nothing in the milk itself that serves actively to produce this condition in case the other food that one eats contains the necessary bulk.

As commonly understood constipation is a condition in which the bowels do not move every day, but as a matter of fact this definition is most inadequate. Many folks who are far from being so regular as this in their bowel activity are still not constipated, and others who have regular daily movements suffer the effects of constipation. It is only when the sluggish bowel gives symptoms of being in trouble that we need consider that a condition of consti
exists.

The most serious a
vanced form of this ver
mon ailment is that w
known as the spastic ty
this condition the bowel is sore, inflamed and irr
It is very significant that a milk diet is the best
remedy for this type of trouble. Milk is smooth, so
and non-irritating. It is hardly reasonable that th
that is proved best for an advanced form of a m
could be the cause of the milder forms of the
malady.

Babies are rarely constipated yet they live on
diet exclusively. The bowel movements have lit
no offensive odor. After folks quit taking an exc
milk diet they abuse the digestive system in ever
imaginable, and it is then that the trouble begin
long as Mother Nature superintends the feedin
gives her own favorite preparation—milk—there i
constipation. The addition of the lactic acid b
bacillus Bulgaricus and bacillus acidophilus, to m
the use of cultured buttermilk is one of the ver
ways of correcting constipation—far better indee
the taking of bushels of pills and tablets.

Even if the material remains in the bowels a l
time than it properly should no harm will come
the milk portion for the reason that the milk pr
are usually completely absorbed and are not pois
or irritating. Other foods being incompletely abs
remain to putrefy and ferment in the bowel. Bad
and poisonous substances are produced which m
may not be absorbed into the body according t
cumstances—or according to different authorities.

Perhaps the most common complaint is that c
folks cannot digest milk. This seems rather st
but there is some basis for the statement in the c
those who have a gastric juice that is not strongly
Cow's milk is able to combine with a large amou
acid and soak up a weak gastric juice like a dry s
in water. One of the main functions of the g
juice is to kill the germs in food. If the juice i
weak to do this the germs still live, and in the
stomach ferment the milk sugar (lactose) and pr
large volumes of gas in the stomach and bowels.
a result the person is uncomfortable and says
bloated, his breathing is laborious, his heart action i

ad he feels quite badly. The fault is not with the ut with his digestion.

v can a condition of this kind be corrected? Such an nearly always drink cultured buttermilk, or the fermented milk drinks. These products have acid content in themselves and do not make a upon the gastric juice. The milk sugar in them n used and there is nothing left that can ferment as production so as to produce bloating. Sour roducts are more easily digested than sweet milk ed they are already partly digested when they en.

was formerly thought that acids should not be with milk. We have often heard it said that the hould have milk and he should also have orange out he should not have them together. We have earned that this is false. Delicate babies are now soured milk, or milk to which lactic acid or some acid as orange juice, or lemon juice, has been and they do amazingly well when so fed. Even ure babies may take boiled cow's milk, diluted hat, to which some of the above acids have been and do better than we supposed possible for o do only a few years ago.

milk is boiled it is considerably easier to digest, in this case very much like meat or most other In case there is the least doubt about the quality x, or suspicion concerning the strength of diges- uch trouble may be avoided by using only boiled Even pasteurization slightly increases the diges- . The cooking of milk does not injure its food es except that it decreases or destroys vitamine fresh fruits and vegetables easily make up this .

ilk is so fattening'' wails the devotee of fashion e days of the slender, slinking yard-stick figure. oubful if anything could be said to change the r the eating habits of such flapper folk unless it ed a beauty hint. It is quite useless to point out reasonable amount of healthy fat—an amount n stick on during vigorous, active, useful life is useful health asset. We are hopeful that the ture may bring more curves into the figure of the able woman—and man.

if one is so deadly afraid of becoming fat he or y drink skim milk and thereby get a large part benefit of whole milk without the fattening effect. ed buttermilk is less fattening while at the same contains the major part of the food value. The ssential factor in beauty is full, bounding, vig- health with its well known "pep" and "snap," r eye, and clear, fresh skin. Milk is most essen- such health and should not be disdained by the e of Dame Fashion.

ny women are injuring themselves by foolish fast- nts to reduce weight or retain the proportions ood nymph. The diets used for this purpose are studiously unbalanced as a rule, and greatly need tective value of milk if health is to be maintained.

netimes old folks have been afraid to drink milk e they knew it to be very rich in lime, and they een afraid that the lime would be deposited in the vessels thereby causing hardening of the arteries gh blood pressure. The fallacy in this reasoning the fact that the deposition of lime in the vessels he cause of the injury to the vessels but is rather the efforts of the body at repair to the vessel. teries are injured by various forms of intoxicating nces taken as food and drink or by the accumula- the waste products of disease, overwork, worry, sleep, and all that sort of thing. The excretory ts of a heavy meat diet have the effect of injuring the vessels, but, on the other hand, milk produces practically none of these irritating substances, and is indeed the very best of all protein foods for old people. The bowels, kidneys, and blood vessels of old people are pretty well worn out and must be handled with care.

Pregnant women have been known to avoid milk in the diet because they have thought that the lime would make the bones of the baby grow large and hard, making birth difficult. It is very doubtful if there is anything in this belief at all. The child will requisition all the lime that it needs from the body of the mother. If anyone suffers from want of lime it will be the mother. The lime and the vitamines of milk are very badly needed at this time of all times. The needs of the growing child make a great and urgent demand upon the maternal body and these needs—vitamines, lime, easily digested and excreted protein, and energy are abundantly supplied by milk. Nursing mothers need milk for the same reason.

When pregnant and nursing women do not have sufficient lime in their teeth, the bones and the healed tuberculosis nodules (sealed by deposits of lime) in the lungs may be decalcified and serious trouble result. Lime in the blood is necessary for coagulation, and the woman in labor is in danger of bleeding, so it is very important that her diet supply her abundantly with this most vital element.

The statement is sometimes made that adults have lost the digestive juices which act upon milk and that therefore it does not agree with them. That is, of course, sheer nonsense since milk is digested by the same juices that act upon other common foods.

In our enthusiasm for milk as a perfect food we must not, however, be guilty of making the claim that there are absolutely none who cannot drink milk without having trouble. Milk is too bulky for many cases of heart disease, and there is in such cases also the possibility that a temporary insufficiency of the digestive system might permit the development of a large amount of gas causing bloating that would seriously hamper the heart action.

There are also a few persons who have an idiosyncrasy against milk. It causes them to break out with hives or an eczema like eruption, or to have asthma or some of the various other mysterious manifestations characteristic of this condition. Other folks cannot eat strawberries, or sea foods, or eggs or what not. There is no explaining a condition of this kind. Such folks will simply have to learn what causes the trouble and then carefully avoid that food. Sometimes they can be "desensitized" by their physician, but the procedure is usually long and tedious, and not a great success. As a rule cooked milk does not cause trouble though some cannot even take that. Very rarely even babies show this condition in which case it is very hard indeed to bring them up to the age at which they can eat other things.

There is a belief that milk is incompatible with certain other foods. The writer once tried in a Boston restaurant to have milk served as a drink when shrimp was the meat course, but the waiter flatly refused to serve it under those conditions. "No, indeed," said he, "milk with shrimp is deadly." My urging was of no avail, so I went down the street to another place and got a glass of milk to follow the shrimp. Of course, nothing at all happened.

Milk with acid fruits as cherries or orange juice is taboo—without reason. The acid curdles the milk to be sure, but so does the acid of the normal gastric juice in the stomach. Indeed, the gastric juice is far more acid than any fruit juice. Milk and tea are not to be taken together, because the tannic acid of the tea "tans" the albumen of the milk in the same way that it tans the albumen in skins. Well, what if it does? And does it really do so? There is so little tannic acid in a cup of properly made tea that its effect would be entirely lost when diluted so much.

As a matter of fact a large part of these prejudices against milk are relics of the days when one could not get the pure, wholesome milk that is available today. It made folks sick in those times because it was impure and unfit to drink. A Syrian friend of the author says that his mother taught him that fresh, sweet milk was a deadly poison, and under no condition to be touched as food. If the milk was boiled or soured it might be drunk, but never when it was fresh and sweet. The explanation is easy. In the unsanitary surrou
of that country fresh sweet milk might have ma
gerous germs in it which boiling or souring wou

one if possible.

Shipper of Milk Held Entitled to Recov From Railroad Company

By LEO T. PARKER, Attorney at Law, Cincinnati, Ohio

IN THE recent case of Orange National Bank versus Southern Pacific Co., 110 So. 329, it was disclosed that the Rogers Milk Products Co., Inc., shipped from Pulaski, N. Y., to New Orleans, La., 650 cases of Rogers' brand sweetened condensed milk to its own order, notify Goodman & Beer, Inc., and transferred the bill of lading with draft attached. The initial carrier of the goods was the New York Central Railroad Company, and the delivering carrier was the Southern Pacific Company. The shipment arrived at New Orleans on February 21, and Goodman & Beer, Inc., notified of the arrival. The shipment remained on the docks for about two weeks, no one presenting the bill of lading, when it became necessary to remove the goods to a licensed warehouse. Goodman & Beer, Inc., had the shipment removed to its warehouse, where it was held apparently for the account of Southern Pacific Company, until March 22, 1923, when the Rogers Milk Company, not being able to present the bill of lading, gave the Southern Pacific Company, an indemnity bond for the goods, and took possession of them, and held them, as owners. Shortly thereafter, Goodman & Beer, Inc., reached the conclusion that something was wrong with the shipment, since some of the cases containing the cans of milk were bulging. Examinations were made and the conclusion was reached that the bulging was due to the formation of gas in the milk, caused by deterioration, brought about long before deterioration should have been expected. Goodman & Beer then attempted to sell the milk; and after some effort in this direction, sold it in the latter part of May to a person named Groetch for two dollars a case, or $1,300 for the entire shipment. The milk in good condition was worth $3,257.02 above the freight charges.

Suit was brought by the holder of the bill of lading against the Southern Pacific Company to recover the value of the milk above the freight charges, on the grounds that the milk was delivered to a third person without the presentation of the bill of lading.

In holding the Southern Pacific Company liable, the court in part of a lengthy decision said:

"The shipment was an interstate shipment, and having been made under an order bill of lading, defendant (Southern Pacific Company) should not have delivered it except upon presentation and surrender of the bill of lading by the lawful holder thereof, and in the event of the loss or destruction of the bill of lading, then only upon an order of court and the execution of a proper bond. Defendant (Southern Pacific Company)
liver the goods to him who was not the holder of
of lading, and hence is liable ...... The rule
the measure of damages for a conversion by the
of goods intrusted to it for transportation is th
of the goods at the time and place of the con
...... From this amount the freight charges
payment of such charges is necessary to enable t
per or holder of the bill to obtain possession
shipment, and the shipper or holder should not
mitted to enrich himself at the expense of the
..... The evidence offered makes out a prim
case that the milk was in good condition when it

Putting Over A Sales Promotion Idea

A Big California Dairy Products Company Adopts a Good Plan for Getting Publicity for Milk. Everybody Joins in Making it a Success

HIEVING what is probably the most phenomenal success ever secured through a campaign of this character, the Crescent Creamery Co. of Los es has just completed a children's contest in San rdino and Colton, Calif., which enlisted the inter- nearly every child of elementary and junior high age. With a total enrollment of a little more 10,000 in these schools in both communities, ap- nately 10,000 children entered the contest for Prince III, a thoroughbred Shetland pony, was d as grand prize.

ider the name of the "Men of Courage" campaign, ontest was planned by Walter Ruf, advertising ger of the Crescent Creamery Co., primarily to in- children in the food value of milk, but it also l as an effective means of acquainting the public the new branch of the Crescent organization re- y opened in San Bernardino under the management J. Barry.

ira La Plante, noted screen star and one of the honorary s in unique contest staged by Crescent Creamery Co., to- with "Prince III," famous Shetland show pony, awarded nd prize in a campaign to stimulate interest among chil- n the food values of milk.

he contest centered around booklets containing out- drawings of "Men of Courage," including such rn heroes as the aviator, the football player, the r, the railroad engineer and others, to be colored eatly and artistically as possible. Each drawing accompanied by a little story which pointed out the of milk in building up strong bodies and steady es necessary for men in such positions, and a glass ttle of milk formed a part of each picture.

election of the most artistic colored books entered in the contest was made by a committee of three prominent California artists, including Frederic L. Pickering, free lance artist and illustrator of Los Angeles and San Francisco; Roi Donatus Sheeran, former director of the American Academy of Fine Arts, and at present art director for the Miller theaters, which include the famous Carthay Circle theater and the Figueroa theater of Los Angeles; and E. G. Michelson, for many years head of the art department of a firm of outdoor advertisers, who is considered one of the greatest poster artists in the country.

Further interest was added by the fact that a group of 12 motion picture stars acted as honorary judges for the event, expressing their desire to impress upon California children the importance of drinking plenty of milk. Among these were such well known artists as Laura LaPlante, Virginia Grey, "Hoot" Gibson, Reginald Denny, Norman Kerry and others.

The campaign was inaugurated with a street parade featuring Prince III, the Shetland pony, which made its way through the principal streets of both San Bernardino and Colton. Motion pictures of the parade were later displayed at a local motion picture theatre as well as in other parts of the state. During the three weeks of the contest, the pony made surprise visits to each junior high and elementary school in addition to appearing at special "Pony Day" sales arranged by prominent retail stores. A special radio program was presented as a tie-up with the contest, supplementing the extensive advertising campaign in local newspapers.

Colored posters showing the "Men of Courage" were displayed in all the schools as well as in the windows of all Crescent dealers in the district. In fact, nothing was left undone to arouse and maintain the interest of the children throughout the three weeks of the contest, and the success attending these efforts is evidenced by the practical unanimity with which they responded.

The prize winners of the contest were announced and the prizes awarded at a special children's party held in the Municipal Auditorium at San Bernardino, the largest hall available in the entire community. In addition to the pony, five second and five third prizes were awarded, while a group of 25 children in the fourth class received honorary awards in the form of souvenirs from the honorary judges. Ice cream and a ticket to a junior matinee at a local theater were given to each contestant at the close of the program.

So far as the contest was concerned, it was strictly educational in its nature and while it was understood that it was conducted by the Crescent Creamery Co., it carried no specific advertising for that firm. However, the tie-up for the creamery company was accomplished through the routemen who delivered to the home of each contestant an invitation to the party at which the prizes were awarded. The routeman again made a personal contact with the public by returning each completed color book with a certificate complimenting the contestant upon the interest shown and the artistic quality of his or her work.

The vast amount of indirect advertising done by the children entered in the contest brought about amazing results in the wholesale field as well, for the children were directed to Crescent dealers for their color books

(Continued on page 25)

What Comes Out of a Milk Bottle?

Here's What One Man Saw Before His Eyes and Yet Didn't "See." He's a Milk Dealer— Not a Merchandiser

TAKE a bottle of milk, now. Put it on the table. Call the family to dinner. Mother pries off the lid and starts to pour from it into the glasses of those around the table.

What is she pouring? Milk? Yes—what else? For there **is** something else—in fact, The Something Else that goes to make life happier and more worth while.

What is it?

The sales problem in the milk business has resolved itself into this: A matter of **telling the public what is in a bottle of milk!**

The milk dealer who wants to sell milk must be able to make the public understand that a milk bottle contains something vastly more than the physical properties that make up milk. It is not only milk that we are selling, it is the thousands of things that milk represents.

There are two men in the milk business—milk dealers and milk merchandisers. There are more of the former. The difference is this, one of them doesn't know what comes out of a milk bottle. You can explain to your heart's content, but the fact remains that, nine times out of ten, one man sells more milk than another because one man can show the public how very many things come out of a milk bottle besides milk. Ask the average dealer what is in a milk bottle, and he probably will begin enumerating the various component parts of milk. The chances are he will overlook the very important things, the thousands of important things, the great jewels of nature that are craved by the men, women and children of this world. We are selling those jewels, those priceless, precious stones that mean more to mankind than all the wealth of the world.

If we human beings could vision the great, unseen forces of life, here are some of the many things we should see coming out of a bottle of milk:

Pour milk for a child. Out of the bottle come, with the milk, myriad faries that we can't see, fairies waving the magic wand that makes for healthy, happy children. Of course, we can't see them, but these fairies bring fine, clear eyes, rosy cheeks, fat, pudgy hands, firm muscles, soft skin, clear complexion. Let's sell these things; they are our merchandise.

Into the glass of big brother is poured, from the same bottle, many things we don't see—strength and skill for sports, for football, for hockey, for tennis, for baseball. Out of the bottle cames a fairy that clears his mind for study, for perception, and builds up the cells of his brain for knowledge, for understanding. Another, from the same bottle, brings nerve force for the many battles of life; brings red corpuscles to add zest and enthusiasm to life and its battles; brings the fine red blood for energy; brings that mental "ginger" for quick, alert thinking in tight places; brings that mental poise for good judgment, for accurate decisions that must be made quickly; brings hard, firm flesh for a rugged body that must face many strong winds four square in the course of life's ups and downs.

Into father's glass is poured, from the same bottle, a glass of milk that disguises many priceless gifts—the finest that nature gives to man. They bring a tonic to a mind worn and torn by the ordeals of the day, raked by the many responsibilities on his shoulders. They bring a new strength, a new faith, a new stability to his health and morale, a new understanding, for when he has finished he generally leaves the table with a sigh of satisfaction and a smile as his eyes sweep in his little family flock, and then the world is bright again, the business that he has worried about so long is worth more c dollar, and he has a whale of a lot of fight left i yet, by gum, before he will let a few squally wi trade frighten him. For he has the dad-blamede est family in the world to fight for. He takes his and his pipe to the evening papers, but doesn't anything; just sits down there and plans to carry next day the fight he had just thought wasn't continuing—plans and smiles.

The smile came out of the milk bottle!

That smile is one of the things we in the milk bu are selling—or ought to be selling. It is our mercha part of the trade that goes with a bottle of milk.

Into Big Sister's glass the milk bottle yields a itable treasure trove that many never underst possibly not even Big Sister herself. Of course, the white teeth, the soft skin "schoolgirl complexion," bright eyes, the full, red the trim, full, well-rounde ure—all of these things, are appreciated, but not ju themselves, **but for what mean to Big Sister!**

They mean what beaut attractiveness mean to young woman of the m period, which is to say mean more to her than thing else in the world to anybody else in the w They mean friends among sexes. They mean praise admiration from girl fri They mean adulation and ation from male friends. mean bringing to her a ho eligible young males f whom she can select The and Only for this great, ous, interesting voyage of

Then last, as is always all mothers, the weary hand finally pours milk mother's own glass. She does it perfunctorily, for, all, mother's service to herself is more or less a mec ical proposition. Nothing else matters after she has her flock. But seeing that everybody else has been t care of, is eating and is cheerful, mother picks up in spirit and begins to pick at her food a bit. Now then she takes a sip of milk and gradually her app works up keenly, and soon she is eating and laug and taking full part in the banter and teasing g on about the table. She laughs with the rest as l Jack tells how his hoop got away from him and ro into the chicken yard of Mrs. Jones next door, and gets a thrill and emits lots of "oh-oh-oh's" with others as Big Brother Jerry tells how he cut loose f all interference, side-stepped several would-be tack stiff-armed another, and then ran a neck and neck with the safety-man, beating him to the goal, by a h lash, with the touchdown that beat the varsity caused the coach to put him on the first-string squa

"I surely had my luck with me today," he mode d at the close. But mother just smiled, and for eason she gave the bottle of milk a gentle pat or she went back to her eating, pausing momenta- see if someone else about the table wanted an- lassful.

n at length, everybody having pushed back their mother drained her glass of the last drop of milk ned back in comfort. She had intended leaving hes entirely for the hired girl to do; she had been ed when she sat down. Of course, she knew, the girl was forever breaking up her best set, but— ow mother felt that an entirely new being had possession of her. She was ready to tackle those with a vim—and tackle them she did. And she d several snatches of an old girlhood song as she l, snatches that made dad look up over his paper chuckle now and then and caused Big Sister to that she didn't know of another woman that age world who still had her voice.

mother, in the wisdom of all mothers that ever een and ever will be, no doubt—knew what was it all. She knew that, when she drained her glass, od fairies of nature had passed on to her some of ry choicest of all her gifts, those reserved for the nest of the human family. She had passed on the of patience and perseverence that constitute real hood. She had imparted the truth of wisdom and de; had passed on the fine graces and virtues that others the strength and vitality to labor and strug- her little band with a song and a prayer in her though her feet were aching dreadfully. The milk s had brought to her a new will to keep carrying rough all her trials and disappointments, with a hat surpasses all understanding.

was the milk goddess who made it possible for to be the last to turn in that night, and so it ned that she stood for a moment at the crib of little after she had tucked him in and planted several od-night kisses in the usual place, and lifted up ken prayers for the safety and usefulness of that nan through all the years of his life.

was then she was startled by a voice that came lad's room.

hen you hang out the card tonight,” he said, off a couple bottles of milk; we've been drinking rn much milk.”

es, dear,” said mother patiently, but in the wis- f all the mothers of all the ages, she went right l ordered the usual amount of milk, knowing that he milk man left the next morning he would leave all the precious gifts that all the Santy Clauses solar system could pack on many sleighs.

or dad, you know, doesn't know much about milk. ust a business man. What business?

, he just runs a milk plant.

at was he worried about tonight? Oh nothing in ilar; he was just upset because his recent adver- campaign had fallen flat.

eople just don't understand how important milk had complained to mother.

laybe, dear,” mother had suggested, “it's because ossibly don't see—er—the full picture of milk.”

he full picture? What the heck—oh, there's noth- that. They had just rather throw away their at the delicatessen counter. It—well, I dunno.” d then dad was right—he didn't.

⁂

you have an idea, put it to work. Don't save it u may lose it.

ADD FIFTEEN YEARS TO LIFE.

In an address before members of Tarentum Kiwanis Club, Tarentum, Pa., C. A. Reed, head of the Valley Dairy Product Company, said that people who drink a quart of the new lactic buttermilk each day can increase the span of their lives by fifteen years. This is not a matter of guesswork, Mr. Reed said, but is a scientific discovery. Lactic buttermilk is made by germinating the milk with the lactic organisms and is a product which, if constantly used, will destroy the disease germs which tend to tear down the body. One must learn to like lactic buttermilk, but after that it becomes a delicacy.

Forty billion gallons of milk are used by the people of the United States every year. The people use a per capita amount of one pint a day for drinking purposes, but by far the greater portion of the tremendous output goes into the making of ice cream, dairy products and confections, Mr. Reed declared.

⁂

DEFENDS CHOCOLATE MILK LUNCHES.

College girls have been severely censured for partaking only of a sandwich and a chocolate malted milk at noon. However, Miss Margaret Beattie, assistant dean of women at the University of California, says: “These are more substantial meals than they seem. Would that more girls drank a concoction which contains not only malted milk but fresh milk, ice cream and whipped cream, all of which are highly nourishing foods.” She also urges college students to drink more milk, realizing that it is beneficial, not only to children, but to adults as well.

⁂

PUT WATER IN COW, NOT IN CAN.

At the annual banquet of the Coventry Cow Testing Association at Bucktown, Pa., Clarence Funk, a farmer of Kimberton, and William Lewin, in charge of the dairy herd of the eastern Pennsylvania state institution at Penn Hurst, received silver loving cups. Mr. Funk received the cup for the honors attained by his cow, “Nigger,” which produced 10,584 pounds of milk and 542.6 pounds of butterfat in one year. She is the champion of 547 cows tested.

In answer to the question, “What is the cheapest and best form of food for a dairy cow?” he replied as follows, “Pure water. Eighty-seven per cent of milk is water, and farmers should be sure the water is put into the cow and not into the can.”

⁂

PUTTING OVER A SALES PROMOTION IDEA.

(Continued from page 23)

and later were told to see the posters in the stores for suggestions in selecting their color schemes.

Incidental to the progress of the campaign, there were several local features of interest. Within a day or two after the contest opened, every stock of color crayons in San Bernardino and Colton was exhausted and special orders for additional supplies were hurried to Los Angeles. Large increased sales of articles especially adapted for children resulted from the “Pony Day” sales arranged by stores who tied up with the contest.

Taking the campaign all in all, it was a huge success from start to finish, and reflects great credit upon the acumen of Walter Ruf for its conception and upon all who participated in its local management for the very enthusiastic execution of the plans laid down by the home office of the company in Los Angeles.

Shall It Be Cotton or Milk?

A Few Observations Which Suggest That King Cotton is Gradually Making a Place for a New Southern Industry—Dairying

By J. L. HOLDEN*

A COTTON field at picking time, its blanket of white sprinkled here and there with deep green, is in reality beautiful and inspiring to the casual observer as well as to the producer who has contributed his labor that this spectacle might be presented. And in 1926, the enormous crop of 18,618,000 bales of cotton was produced in the cotton belt.

But back of this scene there lay for the cotton farmer of 1926 what might be termed, in many cases, a tragedy; for it is estimated that it cost him 16 cents a pound to grow, gather, and gin this commodity, and when, after this investment of time, labor, anxiety, and money, he received from 9 to 12 cents a pound for the product of his cares, it amounts to little less than tragedy.

I stood in the market place in a small Oklahoma town and watched a man, a small farmer, drive up his wagon loaded with two bales of what appeared to be an exceedingly good grade of clean, snow-white cotton. There was no happy look on his face when the buyer offered him 11.5 cents a pound for a product that had probably cost him 16 to 17 cents in cold, hard cash to produce. And that doesn't count his anxiety. During the summer, here was a man who had planted the seed, probably plowed the growing stalks four or five times, thinned to the proper distance in the row, and wondered if weather conditions would be favorable or if insect pests would play havoc with his work. The season had advanced, the bolls had opened to show him a crop that hope to rise high. Here was money for the thi had planned; perhaps a new car, new equipme larger production next year, new conveniences home, and less drudgery for his wife.

The Law of Supply and Demand.

But the trouble was that all his neighbors ha duced equally abundant crops, and then that ine law of supply and demand took effect. There wa than the market could move readily, and the dropped steadily downward.

Across the street, on the other side of the place, a small dairy was in operation, paying price for whole milk. In nearby large cities branches of large creameries which offered att prices for cream. What if our small farmer had producing dairy products and bringing them to regularly? He would have received in return a monthly check, giving at least a small margin of instead of a payment once during the year and tha ment representing a loss.

Cotton farming is essentially a one-crop syste agricultural economists tell us that such a system primary type—the type resorted to when new settled and when the settler desires the quickest p return on his investment. This single crop syst a fertility destroyer, inasmuch as it takes every

AN UNDEVELOPED DAIRY COUNTRY—With the gradual elimination of the cattle-tick where it has been prevale in the South, and with a vast and excellent pasturage still unutilized, this great country bids fair to develop its dai industry rapidly. The above map shows a few of the newer plants. Many national organizations have recently show their appreciation of what the South has to offer by erecting new plants in this territory.

he soil, returning nothing to insure future success.
ge part of the South, instead of adopting some
of diversification with its incorporation of dairy-
d its rotation of crops, which could well include
cotton, has clung to the old-time, one-crop prop-
n of the production of cotton alone, firm in the old
that the fertility of its land was inexhaustible.

Exhaustion of the Soil.

is true that cotton production does not destroy
ty as do some other crops, but it is nevertheless
ning to show its effects in some sections, and those
rs who believed that they could go on for centuries
cing cotton on the same land are realizing their
ke.

at diversification should include the dairy cow is
able, and that the addition of the dairy cow to the
ng operations of the Southern farmer, along with
on of farm crops, would mean a progressive step
direction of his happiness and prosperity is agreed
t only by agricultural authorities, but by far-seeing
n other lines of business as well.

airying is peculiarly fitted to the South. Surveys
have shown a low percentage of bovine tubercu-
Favorable climatic conditions insure a long pas-
g period and consequently cheap feed, together
a smaller initial outlay for less pretentious housing
ties than are required in the North.

hat the Southern farmer is operating in a section
ole of producing feed crops, which fit into a system
tation and which will supply him with abundant
feeds, is amply illustrated by the estimated pro-
ion of a few Southern farm crops for 1926. These
es show corn to the extent of 710,812,000 bushels;
139,763,000 bushels; wheat, 92,966,000 bushels;
sorghums, 45,946 bushels; hay (tame), 11,958,000
These, in addition to imposing figures on other
crops.

Local Outlet is Large.

f course, this argument favoring dairying as a form
versification would be without justification if, after
armer added dairying to his operations, there were
ocal outlet for dairy products. But according to
stics furnished by the National Association of Ice
m Manufacturers, there are in the 48 states and the
rict of Columbia 4748 ice cream plants, 1091 of
h are in the South. As evidence of the growth of
Southern plants, it is further estimated that they
d a total of $6,000,000 each year for additional
ts, enlargements, and new equipment.

Vhen such well known national organizations as
hern Dairies, Inc., Carnation Milk Products Co., and
Borden Company back up their faith in the South
dairy center by building branch plants there, it is
for the farmer to manifest an interest in his pos-
ities for increased prosperity as offered by dairying.

he Southern Dairies, Inc., have divided the terri-
they serve into 11 districts, with a total of 33 plants
ddition to numerous receiving stations. The Car-
on Milk Products Company is now building a plant
upelo, Miss., and one at Murfreesboro, Tenn., thus
trating their interest in the South. The Borden-
hern Company has plants at Starkville, Miss., and
isburg, Tenn., among others, with receiving stations
these plants located at Pulaski, Shelbyville and
mbia, Tenn.

he continual development of natural resources and
introduction of manufacturing, coupled with the
lopment of Southern harbors and expansion of rail-
s, insures for the South a continual market for its
y products.

PROSPECTS BRIGHT FOR GREATER DAIRY

The prospects are bright for the development of a greater dairy industry at Meyersdale, Pa., according to the Meyersdale chamber of commerce and Dr. Kelley, a representative of the Scott-Powell Milk Company of Philadelphia. The agricultural department of the Baltimore and Ohio Railroad has made a survey of the Meyersdale rural region and the findings are exceptionally favorable.

A campaign is under way to raise $30,000 for the erection and equipment of an adequate milk receiving and shipping station. Dr. Kelley declared that a million dollars worth of milk can be shipped from Meyersdale annually if farmers and business men take concrete action soon along the lines he has suggested to them. A market awaits all the milk that can be produced and shipped.

GEORGIA MILK CO. NOW HAS MARKETS FOR ITS PRODUCT.

When the Georgia Milk Co., Waycross, Ga., was organized, for the first few weeks it was compelled by a lack of market to throw away over a hundred gallons of milk a day.

At the present time the company ships more than two hundred gallons of milk daily out of Waycross and has a market for two hundred more gallons. The Chamber of Commerce assisted the company in establishing markets for their product.

It is possible that another dairy will be erected in that city, according to the president of the Chamber of Commerce.

MILK AND CREAM DISTRIBUTED IN ASHLAND, WIS., COMES WITHIN LEGAL REQUIREMENTS.

According to R. B. Southard, state dairy food inspector for the district surrounding Ashland, Wis., the general average of milk being supplied to the citizens of Ashland contains a larger amount of butterfat than the law requires, although some of the milk is quite low. The cream tests also show that Ashland consumers are getting a greater amount of butterfat than the law requires. The law requires a minimum of eighteen per cent butterfat in cream.

MILK PRODUCT OF MODERN DAIRY, INC., ADVERTISED AS FREE OF ALL DISEASE GERMS.

The Modern Dairy, Inc., located off South Cortland St., East Stroudsburg, Pa., will be opened soon. The company will be operated by Benjamin A. Williams and F. A. Lawrence.

The proprietors have installed the most modern pasteurizing machinery that could be obtained in the modern plant which has been constructed. The firm will purchase raw milk from various local dairies, and will pasteurize it. They will then retail it to the consumer. House to house delivery will be made by automobile truck, although as the trade develops it is planned to replace the trucks with horses and wagons.

GROWTH OF DAIRY COUNCIL.

During the summer of 1919 the National Dairy Council opened a small office with one stenographer. At the present time it has fifteen established units and a force of 160 active workers. During 1925 it distributed 7,500,000 pieces of literature, reaching every point in the United States, and spent $760,000 in carrying on its extensive educational work in the interests of the dairy industry.

What To Do When Collections Lag

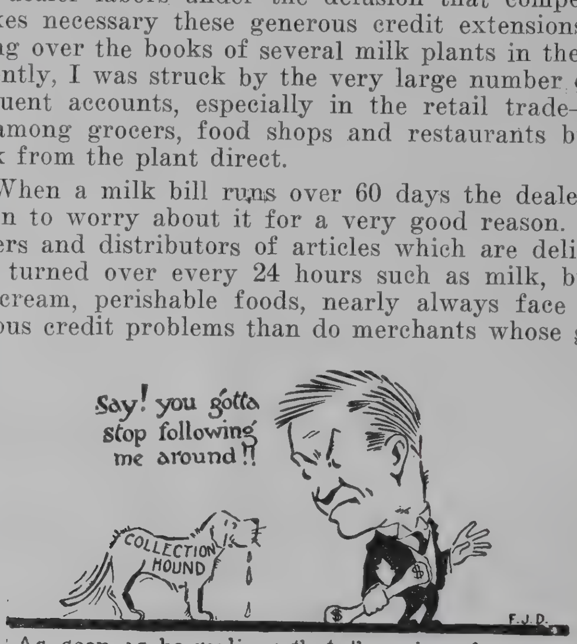
Milk Dealers in Many Cases Extend too Liberal Credits. Delinquency on the Milk Dealer's Books Harms Him More than Most other Business Men

By HENRY J. FEARON*

IT IS my belief, from experience, that the average milk dealer extends more liberal credit terms than almost any other merchant doing business under similar conditions.

The collection facilities of the average small milk plant are not what they ought to be and very frequently the dealer labors under the delusion that competition makes necessary these generous credit extensions. In going over the books of several milk plants in the East recently, I was struck by the very large number of delinquent accounts, especially in the retail trade—that is, among grocers, food shops and restaurants buying milk from the plant direct.

When a milk bill runs over 60 days the dealer can begin to worry about it for a very good reason. Producers and distributors of articles which are delivered and turned over every 24 hours such as milk, butter, ice cream, perishable foods, nearly always face more serious credit problems than do merchants whose goods have a less frequent turnover. It is harder for the food shop to pay for milk it has sold in the past 40 days than to pay for the canned foods which still remain on the shelf awaiting buyers.



Say! you gotta stop following me around!!
COLLECTION HOUND
F.J.D.

As soon as he realizes that there is only one way to get rid of the dog, he will drop the bone

Very recently there was an article in the New York newspapers to the effect that a supposedly wealthy woman, declared a bankrupt, reported owing a milk bill of about $265. This represented milk for her own home consumption and the question arises: How could any milk dealer permit an account to pile up in this fashion?

One Answer.

Perhaps one answer might be that the woman was prominent, apparently wealthy and therefore good—eventually. And here is where many milk dealers lose out on their credits.

Some of the greatest losses sustained by milk dealers are among supposedly rich families whose milk consumption is heavy and who certainly are good customers when they pay promptly. The average milk dealer is not nearly apt to lose through too liberal credit policy on the smaller fry—the customers who are in moderate or poor circumstances.

When the milk dealer's collections lag he is usually satisfied to send out a set of statements with various rubber stamped admonitions over them and then await the inpour of the money. But too often the response isn't what it should be.

Many milk dealers whose books I audit appear to fear greatly the loss of customers if they press for money long overdue. There is the tendency c delinquent to change milk dealers, leaving the cre in the lurch.

This fear is groundless as a rule because it is u ly that the other dealer would welcome a habitua linquent, and when an account reaches such a sta delinquency, it isn't likely that every plant will r any profit on the business.

But a great deal can be done by the milk deal getting in his money. Form letters if they are pro written are productive but the milk dealer gets b results through personal call for collection. Amon scores of milk plants whose financial methods hav come known to me, I have found very few who di depend upon the personal call to bring in the mone

A Good Case for the Dealer.

The milk dealer, if he only knew it better, is very strong strategic position to get his mone promptly when due.

a. He is supplying a necessity of life.
b. He is performing a definite service daily.
c. He has paid for the milk which the buyer or sumer has already used.
d. Delinquency on his books will do the delinq more harm than delinquency on the book other business men.

The personal collection system on accounts w are 30 days past due is what is bringing in the mo Form letters and telephone calls may get cash du certain stages of delinquency, but not when an acc has run past the 30 days from due date period.

It seldom pays the milk dealer to threaten the d quent with a shutting off of service as this arouses tagonism and gives the consumer an excuse to d payment even for a longer period. It is better to p the dealer's reasonable request before the delinq on the basis of common fairness.

Collecting money for a service performed (as aga any merchandise sold) is usually an easier matter t collecting for goods. The promptitude of milk serv the dependability of the dealer's organization, the q ity of his product in the very beginning of each col tion matter stand in his favor in the mind of the c sumer in arrears.

The situation can be capitalized on.

For instance: An Eastern milk dealer regularly proaches delinquents along this line: "You have, I h been getting your orders filled with despatch and c tesy? Our driver hasn't overcharged you, has he? Y have been getting full measure in all cases, haven't y You are content with the quality of our products, you not?"

Getting the Money.

The consumer admitting all these points, which raised politely and with courtesy, the dealer then p sents his bill for payment, also with all the court possible.

Now, he has gotten the delinquent on the defensi has forecasted possible complaints, forestalled excu

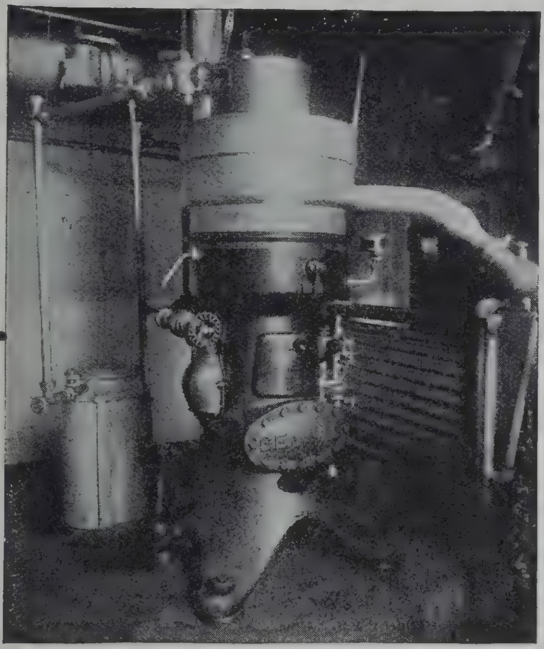
New Series
De Laval Separators

New Series De Laval Separators – A Revelation in Clean Skimming

MR. J. M. WILKENSON of the Nashville Pure Milk Company, Nashville, Tenn., writes: "We have kept a very close check on our No. 91 New Series De Laval Separator and find the Babcock test shows that the skimmed milk seldom exceeds 1/100 of one per cent."

Numerous letters such as this from users of these New Series De Laval machines reveal the fact that this skimming efficiency cannot be duplicated by any other machine on the market today.

Many users have stated that the New Series De Laval Separator skims so close that the Babcock test rarely shows more than a trace of butter-fat in the skimmed milk.



The New Series De Laval is dependable in every way. It is as much improved from a mechanical standpoint as from that of skimming efficiency. One of these improved points is the new form of bowl construction, which is such as to eliminate under ordinary conditions the necessity of having the bowl rebalanced from time to time.

Upon request we shall gladly furnish you with more details concerning the New Series De Laval Separator.

New Series installation in the plant of the Nashville Pure Milk Company, Nashville, Tenn.

The DeLaval Separator Company
NEW YORK ~ CHICAGO ~ SAN FRANCISCO

A New World's Standard of Skimming Efficiency

When writing to THE DE LAVAL SEPARATOR COMPANY *please mention The Milk Dealer.*

that might have been utilized and it is seldom that the customer can refuse to pay for complete satisfaction and for value received.

If, after this approach, there is hesitation to pay, the dealer in questions tries this attack:

"Now, Mrs. Jones, I am certain that you are well able to pay promptly for the necessities of life. These small accounts are irksome to you; but that is all the more reason why the thing should be cleaned up now. Just write me a check now, will you?"

If she hesitates here the dealer at least knows where he stands. He knows that Mrs. Jones is not paying for her milk service because she is plain hard up. Consequently, that is the problem he must meet.

How much more effective this method is than by writing the delinquent an occasional fretful letter or a threatening letter which merely rouses anger and puts the consumer at an advantage.

Once the milk dealer has gotten the delinquent to admit the plant has delivered the goods, satisfied in every way, the request for the money loses much of its ordinary harshness.

Try it and see, you milk dealers.

YOUNG DAIRY AUTHORITY OF AUSTRIA VISITS THE UNITED STATES.

Otto Wolfgram of Vienna, Austria, has been in the United States for several weeks and will make a tour of this country to study American dairy methods. His father owns and controls a large factory in Vienna for the manufacture of dairy necessities, such as milk vats, transportation cans, etc. This firm, Jurany & Wolfgram, is the largest of its kind in Austria, and on his return Mr. Wolfgram will become an associate member therein. We have induced Mr. Wolfgram to write for us the following short article:

OTTO WOLFGRAM.

Austria, formerly a country of 54 million inhabitants, through changes in boundary lines, has only six million at the present time, of which two million live in its capital city, Vienna. Due to ruptures caused by the recent war, the industrial situation there is far from being a favorable one. One of the most effective and surest props for this crippled condition would be a more flourishing and progressive growth of the Austrian dairy industries, which would in a short time succeed in doing for Austria what similar conditions wrought in Holland and Switzerland. Switzerland, which is just as large as Austria, depends almost entirely upon its dairy industries.

Several months ago a company was organized in Vienna, whose object will be to promote and create propaganda for Austrian dairy products throughout the countries, and establish for Austria a reputation equal to that of Switzerland and Holland.

Prohibition in America is claimed to be responsible for the large consumption of milk and ice cream in that country. But in Austria, where ice cream is so little known that only one concern, "The Vienna Dairy, Inc.," manufacture it at all, and where prohibition is a word to be scoffed at, milk can be sold on its own merits and excellence of quality only. It is, therefore, necessary that
the best methods must be employed to put on the
dairy products which will sell on their reputation

Mr. Wolfgram has brought with him from A
two patents, which should be of more than passi
terest to the modern dairyman.

The first patent is a new cover disc for milk b
The disc used so far in Austria was made so t
could be used two or three times and put on by
This often tempted the salesman to either sell th
tents of the dairy filled bottle and refill it with
bought in bulk or cans, or to take away the crea
substitute water, in both cases making an illegi
profit. In that way the consumer never knows w
the milk he buys is the pure product of the dairy
which it has been received, or whether the bottle ha
tampered with and the contents falsified. The new
patent "Ehrhardt," is a safeguard against such da
The disc, according to the patent which gives
name, is cut through and then held together by
paper which breaks by the least pressure or tamp
Thus the buyer is always sure to receive a bottle
has been capped at the dairy, when he sees the
"Ehrhardt" disc covering the same. The thre
dairies in Vienna, The Milk Industry, Inc., the
Austria Dairy and the Vienna Dairy, who sell
200,000 bottles of milk a day, all use and appro
this new patent.

The second patent concerns the handling of
In Austria the large consumers protect the shipm
milk by many advanced or improvised cooling sy
during the transport from dairy farm to pasteuri
plants. Generally this is done by water cooling sy
but when the way is long and the day is hot the
is very often soured before reaching its destination
largest dairies have, of course, installed more eff
systems, which, for the small dealer, prove too e
sive. It is for dairies, therefore, that consume
average of about 300 gallons a day, that the foll
system or patent would be of greatest value.

Low tension direct current is induced into the
can of milk and this kills about 60 per cent of th
teria, without affecting the milk, either in taste or
ity. This makes it possible to preserve the milk at
ten hours longer than could otherwise be done.

DAIRY PLANTS USED A LOT OF IT.

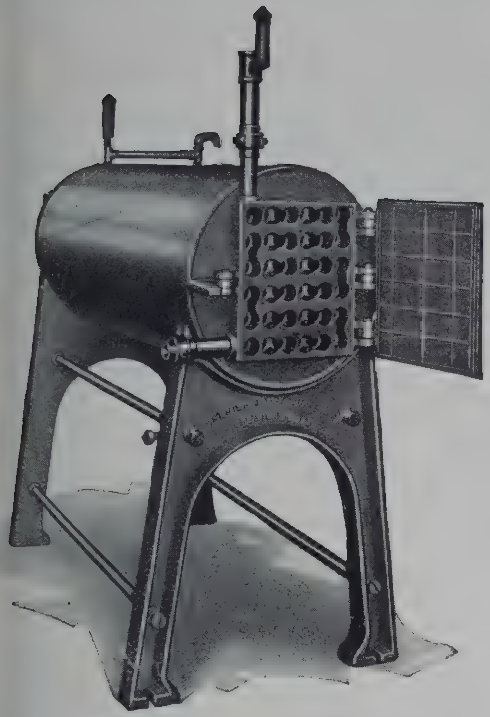
Over 10,000,000 more feet of cork board was s
the United States last year than during the prec
year, according to statistics prepared by the U.
partment of Commerce, making a total for the ye
87,799,212 board feet. Sales of ground cork ju
from 18,246,257 pounds in 1925 to 34,195,310 p
in 1926.

STUPENDOUS AMOUNT OF MILK WASTE

According to reports submitted by the depar
of agriculture, it requires more thas 800,000 dairy
producing at the annual rate of 4,000 pounds per
to supply the milk that is spilled, soured, rejecte
otherwise wasted in the United States. Its total a
gates 3,339,986,000 pounds, which, if sold at $2.2
hundred pounds, would approximate annually th
pendous amount of $77,399,685.

⁂

Spend little effort and you will have little e
spend.



CHESTER BARREL HEATERS

Are Adaptable to almost any Plant Condition

The heater shown above is a specially constructed 16,000 lb. per hour barrel heater made for positive circulation of hot water. In pasteurizing with this type of heater, utilizing inside baffle plates, hot water may be furnished almost entirely by the use of exhaust steam so that practically no live steam is used. Due to the large volume of water circulated the temperature of the heating medium is extremely low.

This is another example of the adaptability of Chester Barrel Heaters—a special construction for a special purpose resulting in greater economy and efficiency.

If you have exhaust steam in any quantity that can be used for heating purposes, investigate this type of Chester Barrel Heater.

Should Milk be Given Credit for Developi Higher Forms of Animal Life?

Chemical Analysis Shows Common Bond of all Mamn —the Passing of the Dinos

WHY the mammals as a class of animal life have obtained the ascendancy in the course of existence, whereas reptile life has gradually receded, is a question which has been answered from many different angles. The dinosaur, as an example of extinct reptile life, is said by some scientists to have vanished largely because of its extreme size and its inability to adjust itself to changing environment.

This explanation is the logical one, yet we wonder if it covers the entire subject, for there are enormous mammals still extant in the form of the slow-moving elephant.

Some recent experiments conducted by Professor H. R. Marston at the University of Adelaide, as discussed in a recent issue of "Science," suggest a new theory to explain the "survival of the fittest." He has discovered that the ancestral strain which unites all the higher animals shows itself through their milk as well as through their blood chemistry. Even the lowest mammals have a common bond with the higher animals in the composition of their milk.

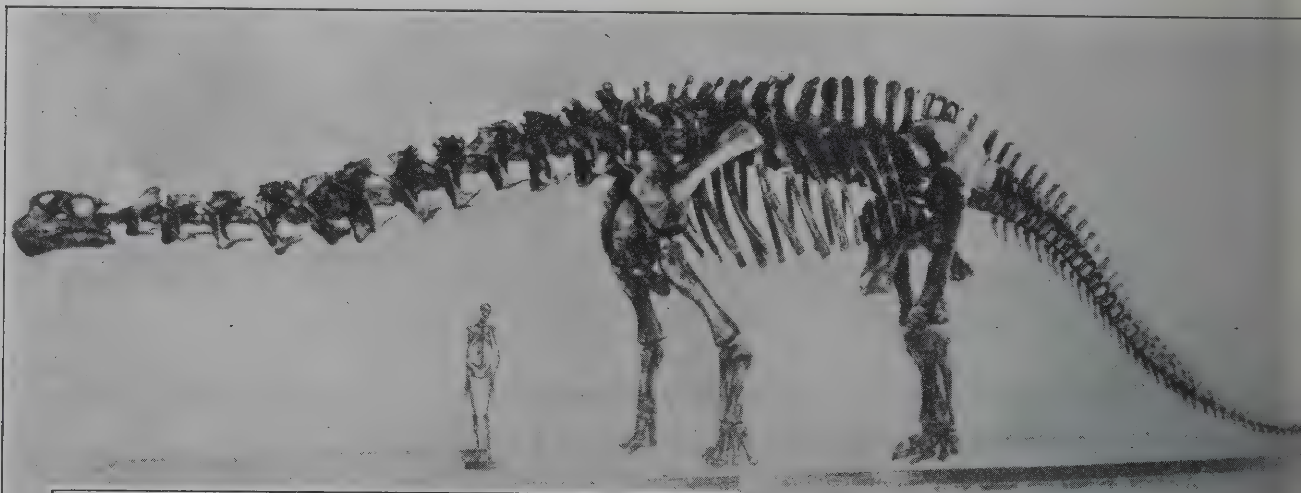
If milk were one type of chemical fluid on one occasion and something else on another, then you could not generalize as to its food properties, nor trace any relationship to the higher forms of animal life. But, in the above mentioned experiments, it was demonstrated that there were certain common characteristics in all th analyzed.

Lactose and Casein are Found Nowhere Else in N

It was discovered that the two chemical comp most commonly found in all kinds of milk are sugar, or lactose, and casein, the latter being the p substance that forms the basis of cheese. Both of compounds are unique and are found nowhere e the animal or vegetable kingdom. The other prote milk, while distinct, are not so profoundly differen the proteins of other sources, as in casein.

Here, according to Prof. Marston, is striking evi of a father and son—or perhaps better a mothe daughter—relationship among all the hosts of mals. As we pass down from man through the dog, tiger, cow, whale, bat, rat, armadillo, to the bill, we arrive at an animal that is obviously c related to the reptiles, for it hatches its young egg has reptile-like jaws, yet nurses its young on mill

Strangely enough, the milk of the duck-bi echidna is exceptionally high in fat, 19.6 per cent present. Among milk known at the present time is equalled only by that of the reindeer and the The milk of the duck-bill has actually three time protein content of cow's milk. It is noteworthy,



In spite of their great strength and resistance, the dinosaurs have disappeared from the earth. While there are many theories regarding this, the mammals as a class have obtained the ascendancy in the course of evolution. The common bond tying all mammals is shown conclusively by the analysis of their milk. All milk, human or animal, contains lactose and casein which, incidentally, are found nowhere else in nature.—Above: Comparative skeletons of man and dinosaur.

Left: A restoration of the Brontos Aurus (dinosaur) by Charles R. Knight.

LD THE PUBLIC BE EDUCATED TO SOME MMON PREJUDICES: BACTERIAL COUNT, CREAM LINE AND SO FORTH.

By A. D. Moldavan.*

steurization was first carried on more or less
ly on account of old fashioned prejudices. It has
a quarter of a century to overcome these obstacles
make pasteurization a rule in the dairy industry.

it like many successful processes it has produced
rejudices. The two most common are the bacterial
count and the cream layer in the milk bottle. Per-
when science will know a little more about
ines, we will witness a new one.

e bacterial plate count does not interest very much
neral public. It is an educated people's prejudice.
e public's mind, bacteria and bugs are similar
s but some health officials and medicos who know,
rse, how to differentiate lactic ferment from grass-
rs are sometimes using bacterial counts as argu-
more harmful than the bacteria themselves.

e dairy industry has reached a point of high
ific development. It has its own specialists and
ists whose views must be taken as the ultimate
ledge of modern dairy science. All these scientists
that although in the past, bacterial counts have
of great help in the realization of the pasteurizing
ss, they cannot be regarded as a mathematical
rement of milk quality.

cterial counts are of some interest from a quanti-
viewpoint, only when made in serial because a
numerical difference between two consecutive
es is generally a sign of defectious work, but an
ed count of unknown history has no value at all.
s not been demonstrated yet, for instance, that a
containing 100,000 good lactic bacteria per c.c. is
dangerous than a milk containing 10,000 peptoni-
acteria per c.c. The opposite is nearer the truth.

e public needs not to be educated on this subject
se it will bring more confusion in its mind than do
ood. When a customer is asking questions about
ria we should invariably tell him that pasteurized
is "sterile," meaning by this, free from germs
than free from bacteria because the man in the
is unable to differentiate germs from bacteria and
orant of the fact that only milk heated at 212 de-
F. under 15 pounds steam pressure for at least one
can safely be regarded as free from bacteria.

e cream line is a housekeeper's prejudice. Since
al times until the Babcock came widely in use, rich-
f milk has been measured by its creaming proper-
This is not an absolute method especially since the
rization era, besides it has not been proved yet that the richest milk is the best, but it is simple and deep rooted in the people's mind.

In Europe, where epidemics used to be common and where it is a rule to boil the milk, people do not pay any attention to the cream line, but in America, contingent of the big bargains, the consumer wants both "milk" and cream in his daily bottle.

Perhaps you have already heard this kind of dialogue on a door step between a lady customer and a milk driver. "If your company cannot afford to serve us richer milk, I am going to quit. Look at the 'Daily Dairy'—what a beautiful cream line they have! Your milk is plain skim milk." And the poor driver who is just as much unaware as the lady about the several factors affecting the cream line properties does not know what to answer and this means the loss of a customer.

The cream line has provided many interesting problems for those dairymen who are fond of mechanics and chemistry. The factors affecting the cream line have been well studied. Fortunately all the changes brought by the first pasteurization experts have been overcome and it is even claimed that a perfect pasteurization will increase the cream line of the raw milk.

It is only a matter of time when all plants having standard material and standard methods will produce an equal cream layer at equality of percentage of butterfat, then the cream line in standard shaped bottles will be the true indications of milk richness.

As these conditions are not yet fully realized to try to educate consumers on our actual and temporary imperfection will do only harm to pasteurized milk.

Instead of boasting of the cream line we should advise customers to shake thoroughly their bottle. It is a common fact that in every home someone gets the cream and the rest of the people the skim milk. This prevents them from receiving their normal supply of vitamine A contained in the butterfat.

The best solution, of course, both for consumers and milk dealers, would be a daily quart per capita.

Our general conclusions are:

1. The average consumer being very suspicious when he does not understand, we should always answer him in a measure to satisfy his ignorance.
2. A closer co-operation between health officials, medicos and dairy scientists when it is needed.
3. A further step toward standardization of dairy material.

Our last conclusion is a quotation of Prof. W. W. Fisk of Cornell: "Life is too short to educate the public, you might better give them what they want."

Summary.

The bacterial plate is an educated people's prejudice (health officialism, medicos, etc.) Only these people need to be educated on this subject, not the public.

When is a bacterial count useful?

The cream line is a housekeeper's prejudice.

Why it does harm to some firm?

Will this prejudice be overcome in the future?

Why this prejudice should be taken as a basis for a new increase in milk consumption?

Four conclusions.

WEBER MILK COMPANY BENEFIT ASSOCIATION FORMED.

Employees of the Weber Milk Company, Philadelphia, Pa., have formed the Weber Milk Company Benefit Association to aid themselves and their families in sickness, accident and death. According to an official of the Weber Milk Company, the dues are $1.00 a month, which will entitle them to a dollar a day benefit in case of sickness, and their families a substantial sum in case of death.

Great Dairy Industries Exposition Launch

Machinery and Supplies Association Houses Lease Area in Tremendous Cleveland Trade Show—Full Data of Which is Now Made Public

THE great 1927 Dairy Industries Exposition—to occur in Cleveland, October 24-29, inclusive—has been launched.

Floor plans and descriptive text issued by the sponsoring Dairy and Ice Cream Machinery and Supplies Association show that once more—as in Detroit in 1926—four acres of area must be devoted to the display of the essential items which dairy products manufacturers of the American continent and of the world will examine.

Issuance of detailed data of the exposition arrangements has followed several months of activity by the association staff under the guidance of the exposition committee of the association and of the latter's board of directors.

Shortly after the issuance of floor plans and other detailed information, member houses of the association, on April 25, began to make reservations of display area. From the executive offices of nearly two hundred member companies throughout the country, requests sped over the wires to the New York headquarters of the association, specifying booths desired. Before the close of the week of April 25 practically the entire area of the huge show had been definitely reserved by member companies.

The association has had for some weeks an extensive list of requests from non-members for area also, and these will be accommodated to such degree as a careful disposition of the still remaining area will make possible.

This year's exposition, just as that at Detroit last year, will be entirely beneath one roof. Also, as at Detroit, there will be divisions of the whole area into more or less intact, but at the same time intercommunicating sections. There will be no segregations of displays according to type, however, but visitors will find in every semi-detached room a representative range of both machinery and supplies, both equipment and materials.

The floor area which will be utilized comprises all of the available display area of the great $6,000,000.00 civic monument, the world-famous Cleveland Public Hall, in which such notable events as the Republican National Convention of 1924 have been held. Two floors in the Public Hall will be devoted to booths—the lower, Exhibit Hall—and the upper, the Arena. To the west of the original Public Hall, a large annex, its available exhibit area exceeding that of the Public Hall proper, will also be used, in full. This section will be known as the West Annex. Connecting the two major parts of the unified structure will be an entirely enclosed arcade, cement floored, heated, equipped with power, water and other necessary exhibitors' services.

The whole great building unit thus to be occupied is only five minutes walk from two of the country's famous hotels—the Hollenden and Cleveland—and is within five minutes walk of a dozen other well equipped hotels.

According to the official information issued by the association, the exposition will include "the complete range of equipment, machinery, supplies, accessories, processes, materials, ingredients, services, etc., for the dairy products manufacturing industries of America and the world."

Admission, as has been the custom, will be restricted to representatives of the dairy products industries only,
and will be determined by registration-identificat
the entrance. There will be no admission fee.

The 27th annual convention of the Internation
sociation of Ice Cream Manufacturers will be held
Hotel Hollenden, October 24 to 27, inclusive.

The 20th annual convention of the Internation
sociation of Milk Dealers will be held at the Neil
Columbus, O., October 19-22, inclusive, its session
cluding on the Saturday preceding the Monday m
opening of the exposition. Columbus is four hour
tance from Cleveland.

There will also occur in Cleveland convention
ferences, etc., of other organizations in or related
field of dairy products manufacture, concurrent wi
exposition.

The Hotel Cleveland will be official headquart
the Dairy and Ice Cream Machinery and Supplies
ciation, Inc. The Hotel Hollenden will be the hea
ters of the National Association of Ice Cream Ma
turers. The Hotel Statler will be at least informal
quarters for membership groups of the Interna
Association of Milk Dealers. These three hotel
also the Winton, are within walking distance of t
position. Other Cleveland hotels are: The Audit
(to be completed in August), Colonial, Fern
Murphy's, New Amsterdam, Olmsted, Alcazar,
ton, Bolton Square, Fenway Hall, Mount Royal,
Lane Villa and Westlake (at Rocky River Station)

HOW TO MEET COMPETITION OF CHAIN STORES THAT OPERATE THEIR CREAMERIES AND SELL MILK AS A LEADER BELOW REGULAR PRICES.

By A. J. Conklin.*

This problem seems to me to come under the same heading as what one would do in case one's home took fire. The conditions, the time and place, with quick action, would regulate the energy expended to protect your own business. And, the best defense is a good strong attack, using your sales organization to fight such an action to a finish.

We have received several letters from different firms on this subject, parts of which I take the privilege of reading to you. Mr. Gilbert H. Hood, Jr., of Boston, says:

> "If a company has both retail and wholesale business it is a question whether or not selling through chain stores has been disastrous. Naturally chain stores sell milk to people who never purchased that company's milk before. This means an outlet for the company's product. There is a certain differential between the delivered price and the store price at which a customer will prefer to have the route man make the delivery. Many customers will be secured by the route salesman when this point is reached. A solid sales organization fighting for business all the time can meet chain store competition. If you have a better product or better service than anyone else you can always sell to those customers who appreciate quality and service."

Mr. R. A. Burns of the Whiting Milk Company of Boston, gives us the following interesting data on this subject:

> "This is a condition which has developed in the Metropolitan Boston territory, and one which caused us serious concern some time ago, particularly as we were selling some of these chain stores ourselves, causing considerable unrest among our retail drivers, with a spread of three cents between the chain store price and the delivery price. We make very little effort to meet the competition, for the reason that it appeared impossible to prevent the housewife looking for a lower price on milk, from going to the chain sto
> the result that we dropped considerable of o
> ness to them. Our real efforts were to deve
> grade-A milk business, and our selling campa
> been built around grade-A, with the result that
> customers are satisfied to stay with our retai
> because of the fact that grade-A is not car
> stores and is consequently non-competitive.
> instances, we routed our teams in order to kee
> strictly competitive chain store territories, w
> result that our business insofar as chain sto
> petition is concerned, has been stabilized, and t
> petition is no longer a serious condition."

Again, Mr. W. E. Haley, President of the Da
livery Company of San Francisco, gives us son
points. He states:

> "Your subject of how to meet competition
> stores that operate creameries, and sell mil
> regular prices, is a difficult question to solv
> you take into consideration that the grocer i
> nating the cost of individual distribution. The
> opinion is that in view of the fact that Oakla
> our home city, has a daylight delivery, an ea
> livery in which the milk would be on the doo
> the customer for breakfast in the morning, as
> quality milk and cream, would help to solve th
> lem."

To these opinions, let me add a summary of
clusions on this subject:

It is question whether, if the chain stores do s
below our regular price, such action on their par
one of the means of increasing consumption.
people who never used fluid milk before to any

The Milk Route Salesman

He Is the Key Man of Every Milk Distributing Organization in Existence, Says an Iowa Dealer

By MILTON HULT*

MAN to succeed in any line of endeavor now days must be an optimist. And despite the oft disappointing experiences in dealing with route sales- ie must remain an optimist. By being an optimist n that one must hope and plan for the best. In g with route salesmen one must hope and plan for vement and better relations. If you think the on hopeless, you might just as well get out of the usiness because the route salesman plays too im- t a part in it.

eryone knows that business is keener today than efore. In the milk business keen competition is g it more difficult each day for the consumer to guish any difference between the products of 's dairy and those of Smith's dairy. To be sure, f us feel confident that there is a decided superi- of our products over those of our competitors— ope that that feeling never leaves us. But to the e consumer—the public at large—the general y of dairy products is much the same.

be sure, your advertising will give your products sed prestige. Your reputation over a long span of is bound to have a wholesome influence upon the tions that grow up in the intervening years. But e of this advertising and this reputation of years ng, unless you have bright, intelligent, **trained** salesmen in charge of your routes, your products t going to be judged superior to those of your com- rs.

elieve training route salesmen is just as important nning an advertising campaign. In my opinion it ly wasteful and quite foolhardy for a dairy com- o spend a large sum of money in an extensive ad- ng program and then to neglect to build up the -up machinery—the route salesman. It would be rofitable to put your advertising appropriation in vings bank at 3 or 4 per cent than to spend your priation without a definite program of route sales- n order to get the best possible return on your ad- ng expenditures.

ully believe that in the eyes of 95 per cent of your ers your route salesmen represent all there is to dairy. Not over 5 per cent give thought to the hat your route salesmen are merely your agents there is a question of overcharge, skipping, wrong or other misunderstanding. To 95 per cent of customers your route salesman is your dairy and his services are satisfactory your dairy is not ctory. Your dairy is represented to your cus- s every day of the year through your route sales- They are your emissaries, your ambassadors— e Lord help you if they fail on the job through f training.

th the route salesman playing such an important n your dairy business it is important that great ht be given to his selection. It amazes me to find, occasionally, dairymen who employ a route salesman just as simply as they would employ a porter, or a flunky around the plant.

I believe that the entire relations between the dairy and the route salesmen should be guided by a carefully made plan. Start your plan with the raw material—a healthy man of average intelligence—and follow this raw material straight through to the finished product—a perfect route salesman—which you always desire, but seldom secure.

First of all I would suggest having an established form of application blank. Such information as name; address; phone number; married or single; number of people supporting; age; experience in delivering; experience in selling or soliciting; member of what lodges or clubs; how spent previous five years, should be secured. It is also important to try the applicant at the use of paper and pencil. This little point is quite important because frequently he must write notes of explanation to customers he does not come in contact with and always he must keep accounts in his book. I have seen application blanks going into a man's history, listing names and ages of all members of applicant's family, color of eyes, etc., but I do not believe that such information helps you select a good route salesman. Making a careful selection of route salesmen enables you to pick the best and you will be surprised how it tones up your organization when they appreciate that they were not just hired—but were selected.

All our route salesmen are bonded. We do this not alone to protect us from dishonesty, but also because from experience we know that it makes our men appreciate that they hold a position that every Tom, Dick, and Harry can't fill. Incidentally, when you make out an application for a bond for a new route salesman you are able to secure any additional information that you might desire for curiosity's sake, regarding a man's complexion, family relations, financial status, and what not—that had better be left off your employee application blank.

When a route salesman has been selected your training starts—and I don't know when it stops. First of all should come a tour of inspection through your plant. You can't expect your route salesmen to be able to clearly describe your plant or your processes, if he has not been taken through the plant and had everything explained in great detail. By showing him the plant and explaining the various machines and processes, you are able to convey some idea of what you are trying to do.

Then should follow a course of instruction on the rules and regulations in force. This is important because your rules and regulations have been set up from your own experience as being necessary. They set forth your policy with regard to contracts which your route salesman make. Unless you get your new route salesman to fully appreciate the rules and regulations right at the start, some older route salesman, who may be beginning to slip from the straight and narrow path of excellent

---

perior Dairy Co., Davenport, Ia., at Detroit convention of ernational Association of Milk Dealers.

employee, is going to do the interpreting of the rules and regulations to the new man to your detriment.

After a man has been broken in on the route, your educational training just begins. Our company believes strongly in the training school. I must confess that at times we get very discouraged. Many times we come across an incident where the route salesman took some action directly opposite to what he was instructed to do in our training school. But our consoling thought is, that should we not have had our training school, such errors would be general, rather than the exception.

Just a few words about the training school. Approach this phase of your relations with your route salesman in a conservative manner. Don't think that you are going to make super-salesmen out of a crowd of average men, through a course of sales instruction given at your plant.

I realize that a number of sales promotional agencies who solicit work from dairy firms give one an impression that they hold the secret. That they can make miracle salesmen out of your ordinary type of route salesmen. In my opinion this is pure bunk. I don't believe that it can be done. And if it could be done, I wouldn't want it done—from the standpoint of safeguarding the interests of my firm and reducing labor turnover to a minimum. If it were done your men would leave you just as soon as they had completed the course of instruction and seek employment where they could work four and half days a week, wear a white collar, and sleep on Sundays and holidays. There is no use to expect perfection in route salesman sales training, but you will be surprised at the marked improvement in your men if you have never before had a sales school.

I don't believe that a sales school should be held too often. Twice a month, in the afternoon, an hour in length, has been shown us by our experience to be the best. When we are running a sales contest and desire to keep interest and enthusiasm at a high pitch we have meetings weekly.

The best material available—without signing up for the services of "experts"—is the sales manual compiled by Mr. M. O. Maughan of the National Dairy Council. The book entitled "Getting Ahead on the Milk Wagon," published by the Mathews Company can also be used to advantage. These two books should be supplemented by occasional talks by experienced sales managers who are in your city. The National Cash Register representative, the Burroughs representative, and others from various department stores, factories, and business houses will be more than glad to visit your plant and give a talk on salesmanship or some phase of salesmanship to your employees. Such talks are very helpful and are inspirational in effect because it makes your route salesmen realize that after all salesmanship is similar whether the article being sold is milk, cash registers, washing machines, automobiles, or what.

It is important in your sales school to bring your men out. This can be done by asking questions and by having sales demonstrations. We frequently run sales demonstrations between individuals and post small prizes allowing the rest of the men to be the judges of the best sales demonstration. We always close a sales demonstration with a frank criticism of the technique of the individuals concerned by the rest of the men. You will be surprised at the good and bad points picked out by the men. Don't make the mistake of starting a lecture course, where you do the lecturing and your men are expected to sit at your feet to drink at the fountain of knowledge. Make the sales school a real school for your men, with the men themselves playing the important roles.

Just a few words about general working conditions,
and I shall be through. The answer to the wage
is a difficult one. Wages paid route salesmen in
port, Ia., have little influence upon the wages
Detroit and vice versa. The wages paid your rout
men are influenced by the general wage scale
city. I believe that route salesmen are entitled to
in excess to that paid for other delivering. Th
salesman must begin work very early in the m
he must work every day in the year—unless you
a day a week off or grant him a vacation—he
more than a mere deliveryman or peddler—he
a salesman, and more than that he must be cap
keeping books accurately. A route salesman is
to a wage higher than the average paid unskille
ers, and should have it.

I do not believe that any route salesman can
proved through a straight wage of so many doll
week. I realize that many companies pay a
wage. It is my opinion that if ever there is a
use some form of incentive wage it is in the case
route salesman. When an incentive wage is wor
it is a question whether to put the incentive towa
or collections. When it is put toward sales it
paid as a per cent on sales or an allowance at
a point over an established base. We put our in
on collections, and try to send home to the
thought that the more sales, with prompt collecti
bigger the check on Saturday. Here again ent
question of the size of the commission. This ha
worked out with consideration of the size of th
antee, if any, and the wage possible to a man if h
exerts himself to the maximum.

A very important factor to consider in relatio
route salesmen is the matter of sales contests.
great believers in such contests. They enable
boost sales, but from the standpoint of relatio
route salesmen, they enable you to develop you
organization. We run sales contests between indi
and between teams. Team contests are essentia
sionally, in order to permit the "average route
man" and the route salesman with "a tough ro

thought in this matter of a house organ is that it

It's painted with Barreled Sunlight

. . yet the finished job cost no more!"

LUSTROUS — smooth — white. Guaranteed to remain white longest. Proof against flaking—resistant to dirt—easy to wash—Yet costs no more!

How is it possible? Why does Barreled Sunlight with all these advantages actually cost no more on the finished job than many paints priced less per gallon?

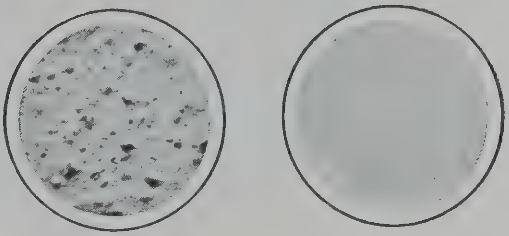
Only by breaking away from all established formulas and methods of making paint, which resulted in the exclusive Rice Process, could such quality and economy be combined in one product.

It is this exclusive Rice Process of manufacture that gives to Barreled Sunlight, not only the qualities of the finish itself, but the extreme "hiding power" and ease of flow that makes *less paint* and *less labor* necessary to do a given job. This is economy where economy counts the most.

* * *

We would like to send you our free booklet which shows, more in detail, why thousands of industrial plants find Barreled Sunlight by all odds the most practical interior paint from every point of view, including cost.

U. S. Gutta Percha Paint Co., Factory and Main Offices, 9 Dudley Street, Providence, R. I.—Branches: New York, Chicago, San Francisco. Distributors in all principal cities.



Ordinary Flat Finish White Paint

Barreled Sunlight

The microscope shows why Barreled Sunlight remains clean longest

These photographs of paint surfaces were made through a powerful microscope. The astonishing contrast shows why Barreled Sunlight is so easy to keep clean. Smooth and unbroken, it resists dirt and washes like tile.

What Users say:

The Nashawena Mills, at New Bedford, Mass. — "Your paint not only spreads better but seems to go further than any paint we have ever used."

The General Fire Extinguisher Co., Auburn, R. I.—"Our specifications called for three coats of lead and oil, but the work was done with one less coat, your claim that two coats of Barreled Sunlight would give a white and more solidly covered and durable surface proving true."

The Great Western Laundry, Chicago— . . . "We checked up and found Barreled Sunlight was much cheaper than our previous painting job done with a paint much under your price."

The Grennan Bakeries, Inc., of Detroit— "We find that Barreled Sunlight retains its whiteness . . . can be washed like tile, and can be easily applied, so that it actually costs less than any other paint we have ever used."

into the home and is seen by the wife and children. Knowledge and interest in the work of the husband and father is worthwhile among the wives and children.

Inspirational posters about your plant, particularly in your route salesman room, are good.

If you can afford some form of group insurance and present it to the men with a definite aim in view rather than as a generous donation, or a piece of charity, or philanthropy—that's fine!

Occasional social meetings should be held. We find that social meetings with the employees alone—rather than the family socials are best. When the ladies are present it keeps the men from being themselves. True, it is nice to get the women interested, but at a dinner gathering when the women are present there is a possible chance of dislikes developing. An exception to this is the annual picnic. It seems that the picnic is a place where the men and women can gather without restraint. This is largely due to the fact that a program can easily be arranged which keeps everyone interested during the picnic and therefore little time is left for the women to gossip about dress, make-up, actions, and the like.

And I want to say a word for athletics. If you haven't any athletic teams get them started. You will be interested in the spirit developed. We find that baseball, bowling, and basketball are best for general interest and enthusiasm. Our employees are always interested in our teams and turn out to root for their fellow employees.

If you have a real large organization you can of course afford to engage in other diversions, possibly musical in nature. But, by all means, provide diversions for your men. They will develop the men and will bring about a wonderful spirit of loyalty to your company and its name.

In conclusion I want to again emphasize the great importance of the problem of the route salesman. If you want to pass your competitor, if you want your customers to know that the product left at your door is not "merely milk" **but** the best milk in the city and from your dairy; if you want to increase your sales, and decrease your complaints and quits; if you want to develop a happy, contented sales organization that will work for your interest and reduce your labor turnover to a minimum—give much thought and time to the route salesman. He is the key man of every milk distributing organization in existence.

⚜

BUILDING NEW DAIRY.

D. Zurec of 2094 Dowd Ave., Cleveland, O., began work in a dairy at Lakewood, O., about five years ago. It was his first experience in dairying. He liked it so well that after a year as an employee he installed a small dairy of his own at the Dowd Ave. address. Success came to him and in four years he has saved enough to erect his own splendid little dairy at Fisher Blvd. and Joslyn Rd. It is a two-story structure, with the garage in front and the dairy in the rear, and two pasteurizers, an ice machine, and a cooler are to be installed. Two hundred gallons of milk per day is the present handling but Zurec expects a growth of business in the new location which will be occupied some time this coming season.

⚜

NEW MILK ORDINANCE IN SOUTH BEND, IND.

Restaurants and soda fountains in South Bend, Ind., changed over to the use of bottles instead of pump containers for dispensing milk to cafe and fountain patrons, in conformity with the milk ordinance which recently went into effect.

GROWTH OF COLUMBUS ICE CREAM AND CR ERY CO. HAS BEEN REMARKABLE.

From a neighborhood ice cream dispensary, th lumbus Ice Cream and Creamery Company, Colu Miss., has become the supply depot for dairy pro in northeastern Mississippi. The story of the pro of this concern is not new to the industrial world is of great importance to a country which is just ening to dairying as a business accomplishment.

It was some time in 1916 that D. S. Cox bega manufacture of ice cream in his home on a very plane and sold it to his neighbors. It was delicio cream—like Mother used to make—and became popular. Shortly after, a friend informed him o technical details of ice cream manufacturing and the little plant came a modern scientific ice cream m Gradually ice cream was made on a bigger scale. Mr. Cox installed a churn and employed a butterm and gradually this department of his plant began t velop, and from a moderately small ice cream and creamery the Columbus Ice Cream Co. branche and grew. With the aid of Byron Morris, now sale of the Creamery Package Manufacturing Co. of Chi the very latest devices for the timely, sanitary and production of its products were installed.

Roy M. Hardy, expert creamery and ice cream o tor, became associated with Mr. Cox and is at pr employed as assistant manager.

The success of the company is not due entirely t own efforts, Mr. Cox said. He gives a great deal of it to his loyal and capable corps of managers and w ers. The personnel of the company is as follows: Cox, owner and manager; Roy M. Hardy, assistant ager; W. T. Smith, general superintendent, produ department; Henry O. Bealmear, manager creamery partment; J. R. Vaughn, production manager, ice c department; James A. Stephenson, manager ship and receiving department; H. R. Keenum, manager, tling department; Miss Winnie Hays, manager retai partment; A. G. McConnell, milk solicitor and sales and D. B. Thompson, delivery department.

During 1926 the Columbus Ice Cream and Crea Co. made and disposed of approximately 75,000 ga of ice cream. It made and sold approximately 100 pounds of butter and handled 25,550 gallons of Under present conditions the plant has a capacit 3,000 gallons of cream daily and this can be exte to 4,000 gallons when necessary.

An indication of the delicious quality of the prod produced by this company is shown by the fact that Mississippi State College for Women, located in city, has purchased its products for years.

L. J. Folse, general manager of the Mississippi S Board of Development, said in commenting upon the velopment of the Columbus Ice Cream and Crea Company: "Northeast Mississippi is to be congratul upon having so fine an industry as the Columbus Cream and Creamery Company. D. S. Cox is a forw looking progressive citizen as he plainly shows whe created an industry that occupies so important a p in the upbuilding of the rural districts."

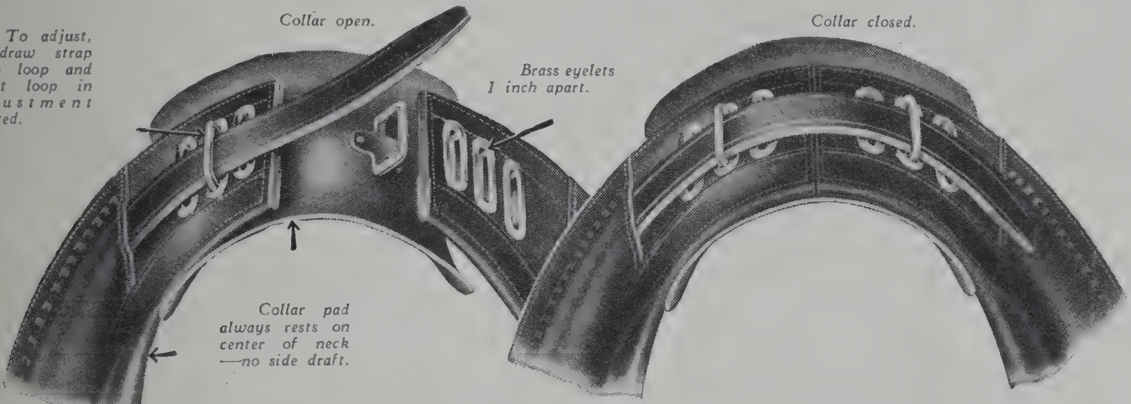
IOWA STATE
DYNAM

The *Walsh* ADJUSTABLE Horse Collar

An amazing new horse collar improvement that prevents sore shoulders and enables the horse to pull a bigger load. It can be adjusted easily to conform to the exact measurement of the horse's shoulder, putting the load pressure in exactly the right spot on the shoulder to make it comfortable for the horse. The simplest, handiest, most humane collar made. It has made a hit wherever it has been tried, and 25,000 are already in use.



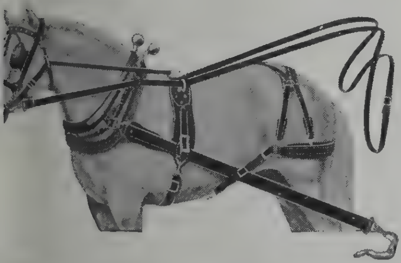
Collar open.

Collar closed.

To adjust, withdraw strap from loop and insert loop in adjustment wanted.

Brass eyelets 1 inch apart.

Collar pad always rests on center of neck —no side draft.



Walsh Milk Wagon Harness

Walsh Milk Wagon No-Buckle harness is the world's strongest and longest-lasting harness because it has no buckles to cut straps, no rings to wear straps and no holes in straps to weaken them. The handsomest, most perfect-fitting harness ever made. Sold on 30 days free trial. Catalogue upon request.

CORRECTLY SHAPED, FAULTLESSLY MADE

Walsh Adjustable Collars are made of the highest grade bark tanned leather, which has had all the stretch taken out of it before cut to shape. Ordinarily collars get out of shape. Walsh collars never will lose their scientifically correct shape. The collar pad cannot curl under for it is fastened on both sides. Long rye straw has been used for filling because it has a tough, long-lasting fibre that stands up better than wheat or any other straw.

EASY TO PUT ON OR TAKE OFF

If the Walsh adjustable collar had no other improvements except the ease with which it is taken off or put on, it would still be the world's best and most popular collar.

WE WILL SHIP ANY HORSE OWNER A WALSH COLLAR TO TRY FOR 30 DAYS FREE. Order one by parcel post. We leave you to be the judge. Ship it back if not satisfactory. Catalogue upon request.

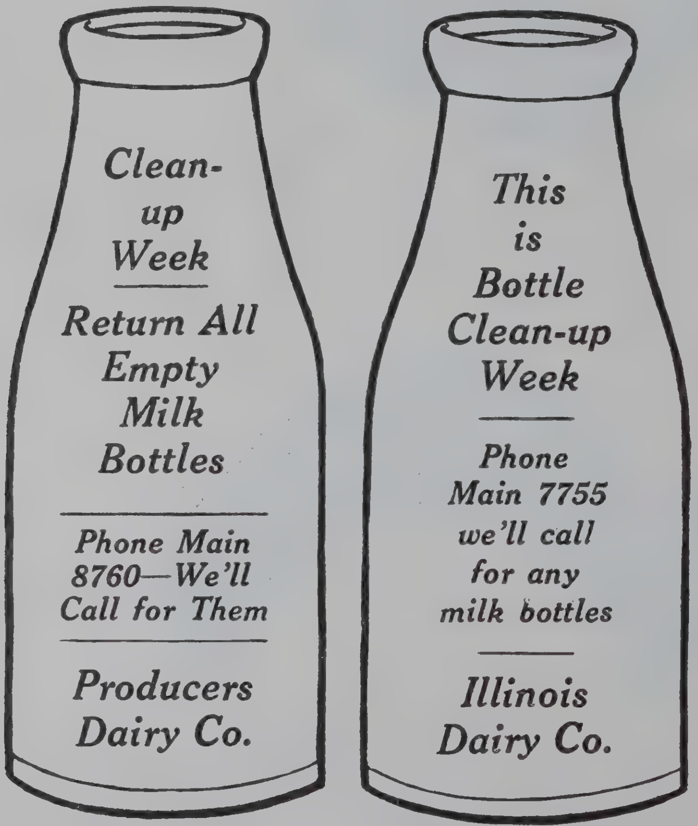
Getting Back the Empty Bottles

An Investment of $150 in Advertising Brought $2,000 in Nine Days. A Net Profit of $1,850 or More Than $200 a Day.

SOUNDS like a Florida real estate ad but it happened in the center of the famous corn state—Illinois—and at Springfield, the capital city. It was the result of a campaign for the return of milk bottles.

The three largest dairies in the city—Illinois Dairy Co., Producers' Co., and the Sangamon Dairy Co.—faced the problem that is the same the country over—startling losses of money annually through unreturned bottles.

Briefly, the survey of possible sources of losses showed the exchange, operated by the companies, was functioning effectively and efficiently. As in every other town of considerable size, this exchange was saving or making money for the companies.



Clean-up Week

Return All Empty Milk Bottles

Phone Main 8760—We'll Call for Them

Producers Dairy Co.

This is Bottle Clean-up Week

Phone Main 7755 we'll call for any milk bottles

Illinois Dairy Co.

Two Advertisements Used in Springfield Campaign.

Again the state law, rigidly enforced by the state department of health, had practically eliminated the use of one company's bottles by another company. The constant vigilance of the department inspectors, and a fine or two as a sample, had successfully stopped the leak of labeled bottles to the smaller companies—these individuals now use their own or unlabeled bottles. The losses then must be in the homes. Giving full credit for breakage in the plants and on the routes, the housewives of Springfield had a lot of milk bottles in their kitchens, basements and on the back porches.

Going a bit farther in the survey of possible losses, it was found that the regular delivery customers were not the worst offenders. The drivers are charged with bottles and so exercise every effort to get their customers to put out the empty ones. Those who bought milk at the stations—the grocery, the soda fountain over the retail counters of the dairy plants we most flagrant offenders, it seemed.

The three dairies—the largest distributors city, were already conducting a co-operative "use pasteurized milk" campaign with several ads a in the local papers. It was decided to "invest" $ the "Milk Bottle Campaign" and the newspapers chosen as the cheapest and most effective mediu reaching the homes of the capital city. This cam was conducted separately from the "pasteurized" and each ad was signed by one of the dairy comp

The first ads appeared on Monday morning, ary 28, and continued until March 9 (Sunday excl The milk bottle outline cut (as illustrated), req 5 inches space, was used for the entire nine days, ing 150 inches in all. There are two papers in th morning and evening, and the schedule for each was as follows:

Feb.	28	Ills.	Pro.
Mar.	1	San.	Pro.
Mar.	2	Ills.	San.
Mar.	3	Ills.	Pro.
Mar.	4	San.	Pro.
Mar.	5	Ills.	San.
Mar.	7	Ills.	(Thank you ads)
Mar.	8	Pro.	(Thank you ads)
Mar.	9	San.	(Thank you ads)

The ads appealed to the fairness of the mill sumers. No prizes were offered, nothing was pa the bottles. The dairies offered to send trucks to up the bottles, a telephone call being the only ex necessary on the part of the housewife—the comp would do the rest.

The general copy ran as per schedule for six and the last three days space was devoted to "T You" copy signed by each dairy—using the same bottle outline so that the ad would be readily iden

It is interesting that the "Thank You" copy p quite as effective as did the original appeal. The day both papers carried a short news story expla the campaign clearly, suggesting that the retu empty bottles would be necessary if the local comp were to continue to offer milk at the present pr otherwise the bottle loss in dollars and cents would to be added to the cost of milk. This was the reader space used—it was given without charg course.

Other than the preparation of the copy, the outside expense involved was $4.50 for 300 paper st ers, 10 by 24 inches, with the words "Co-operative tle Clean-up Week" in heavy black type. These put on all the wagons, the down-town service tr in the windows, over the retail counters, etc., of company.

By ten o'clock on the first day the invitation 'phone the dairy and leave your order for the tru call for empty bottles" resulted in from 20 to 50 at each plant. Straight through the entire nine campaign there was an almost constant ringin 'phones that brought in a stream of orders. More more trucks had to be added to the fleet devoted to work, and every regular milk wagon brought in

It was several days after the close of the cam- before all the orders could be answered.

one home in the better section of the city, 400 bot- ere taken from the basement—40 to 100 were com- "finds." Maids allowed these to accumulate and ngly did not understand that the companies d the bottles returned. In fact, there was an idea housewives doing their own work, as well as with servants, that milk bottles were the same aper carton for butter or ice cream—to be thrown after the contents had been used. Interesting, too, of the bottles were simply stacked away, and were ing used for paint, preserves or home brew, as is mmon presumption. In most instances the house- were grateful for the opportunity of having their ents or pantries cleared of the bottles.

nservatively estimated, the cost of a single bottle ents—the campaign costing each dairy $50, netted results. The Producers' Company, 10,000 bottles 0; the Sangamon Dairy Products Company, 18,000 s or $900, and the Illinois Dairy Company, 12,000 s or $600, a total of 40,000 bottles or a net profit 850.

his was the immediate net profit, but from an edu- al standpoint the results will be far more valu- Each dairy is finding the daily loss of bottles er, because the housewives of the city have learned empty milk bottles are valuable and that it is im- nt they be returned promptly. MILK-PLANT STUDY TO SHOW WHERE BACTERIA INCREASE.

In an effort to help the average milk-plant operator locate the causes of sudden "hops" in the bacterial content of bottled milk, Ernest Kelly, in charge of market-milk investigations, bureau of dairy industry, United States Department of Agriculture, is conducting a study of at least 100 representative plants. It is important that the count be kept as low as possible, and although increases during handling may be relatively small it is of considerable help to the plant operator to know where and why any sudden increases are likely to take place.

Data secured from 20 plants studied to date show that certain operations in the plant, such as sterilization of equipment and storage, are more apt to be slighted than others, and that noticeable increases in bacteria take place as a result.

The discovery that decided jumps in bacterial count often take place after the milk has been bottled and while in storage awaiting delivery has led to the further study of temperature conditions in the average storage room. Two men are now engaged in this work and are making observations in a number of storage rooms, noting the differences in temperature in all parts of the room. Daily variations as great as 34 degrees F. have been noted.

It is expected that the complete study will reveal the specific operations that need to be watched with particular care to keep the bacterial count of the bottled milk at a minimum. Such a guide as to possible sources of trouble should be of considerable value to the milk-plant operator who is not in a position to employ a specialist.

BUSINESS AND THE TAX SYSTEM.

The time is at hand in the opinion of the chamber of commerce of the United States when business and the government can both profitably set themselves to the task of reshaping and simplifying the federal system of internal taxation. A first step in this direction will be taken at the forthcoming annual meeting of the chamber next month when, at the finance session, the possibilities of business and government getting together will be discussed from the viewpoint of both.

Congress has set up the machinery for a study of the whole problem of taxation by the creation of the congressional tax commission. To what extent business can co-operate with this agency and the methods to be followed are questions of immediate concern. The discussion is all the more timely in view of the fact that the growing surplus makes tax reduction possible, presenting at the same time the problem of determining what policy should be followed in cutting down taxes.

The meeting is designed to bring business opinion to a focus upon the general subject and to pave the way, so far as possible, for the recasting of a national policy of taxation to obviate the difficulties of the present system, which has grown up haphazardly and still bears the earmarks of war-time necessity, in order that economic development can go forward with the greatest possible freedom.

ARCADIA IS NO MORE.

The Arcadia Farms, Rondout, Illinois, owned and operated by the Brookhill Farms, Genesee Depot, Wisconsin, are no more. The Illinois property has been sold for sub-division purposes and the stock and equipment for producing certified milk has been moved to Brookhill.

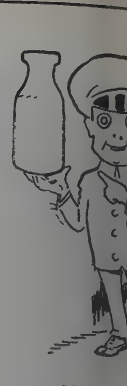
Special Solicitation in Milk Selling



How One Company Puts on New Customer Drives and Sales Contests. No Short Cuts to Success in Business

By
C. G. BEARDSLEY*

I PRESUME when I tell you that we put on as many as one hundred to one hundred and twenty-five customers on one route in one day, you will naturally think I am the biggest liar that ever came out of the West. But, maybe I am. But, unfortunately, I happen to be in the milk business, where I can use that.

Mr. Little has accorded me the privilege of addressing the Sales and Advertising Section, on the subject of "Special Solicitation."

What I offer at this time is the result of our experience with different methods of retail solicitation. We have followed with some degree of success, five different plans. I shall endeavor to explain briefly each of these.

First Plan—New Customer Drive.

During the summer of 1925, we inaugurated what we term, "New Customer Drives." Recruiting from our wagon salesmen our ablest men, dressing each man in white coveralls, seeing that his shoes are shined, that he wears a white collar and is neatly dressed. We build up crews of from 10 to 20 men, with each crew we put one man in charge.

Where the territory to be covered is in close proximity to the plant, our most attractive horses and wagons are used, when we are working on distant territory we use trucks. Our method is this, five men are allotted to each vehicle, the driver and the four men who are to solicit.

We carry a liberal amount of samples; milk, cream, chocolate milk, buttermilk, and cottage cheese, all samples are thoroughly iced. When the crews have arrived at the territory to be covered, one crew is assigned to each street. Two men go down each side of the street, calling at the door of every prospect while the driver follows with the vehicle. Each salesman carries his basket filled with an assortment of the samples, and is also equipped with a portfolio, containing a number of choice views of the dairy, telling in pictures the story of a bottle of pasteurized milk, from milking time to drinking time. Generally, the arrival of the men and vehicles at an unexpected hour, creates considerable curiosity in the neighborhood, and invariably a crowd of children are out to meet us. We make good use of the samples by giving each child a treat. The children hurry home and show their parent the prize, and herald our arrival. By the time the salesman has started down the sidewalk he finds a number of his prospects out to meet him, consequently his interview is made much easier. The psychological effect is this, you have given the child something and the parent is already more or less in a receptive mood. The salesman steps up to the door and greets the prospect, announces that he is there to interest her in our dairy products, and describes the entire line suggesting the use of one or more of them. In the course of the conversation, the salesman offers the prospect a sample carton of cottage cheese, this cheese is something the whole family can partake of, and very few refuse it. The salesman carries on the conversation to the point where he feels the prospect is ready to buy, and endeavors to close the interview. Regardless o the prospect may be, there is this advantage with tation of this kind, the pictures tell the story, the man has the samples with him, the prospects see they are going to get, they are privileged to try a them. They cannot consistently question the qu nor offer the time worn excuse, I heard your milk v good, or Mrs. So and So, told me to try another da

In conducting these drives, we insist that the man whose territory is being covered is a member o crew, thus the men are informed as to where they call. Some of our men have made remarkable reco these campaigns. One man in particular has put many as 35 bona-fide customers in a single day. average had been from 6 to 8 customers for each per day. Over a period of 3 months in 1925, a ca check was made of the results obtained from these d During this time we added over a thousand new tomers, 750 of which were still buying some 60 later. Our largest results on any one particular was an increase of 117 new customers in one day. was a territory where we were putting in a new covering a section of the city which we had only tially covered previously. In another instance we a 78 new customers, 65 of these were buying 6 m later. The best results are obtained where the terr is covered with as little delay as possible.

We use our regular retail drivers for this work these drives are put on in addition to running routes. Our men have worked willingly, and hav tered into these campaigns with a great deal o thusiasm. We estimate our losses on business of kind, at from 25 to 35 per cent which we feel is not heavier than the normal loss on any sort of hou house solicitation, where a large per cent of the inc must come from competitors. There are a certain ber who will order out of curiosity, or the salesman for granted, that they will become regular custo these, of course, drop out in a short time. We have our greatest success with these campaigns in out territories, localities where the city is growing rap and among the modest home owners. We have n tried them in a high class apartment house territory a wealthy neighborhood, and do not feel that they w be successful under these circumstances. Campaign this kind must be handled tactfully, you cannot re them in the same territory, except at long intervals. fact that they are a novelty with the public is some responsible for their success.

On the face of these figures it may appear th proposition of this kind is costly. By actual check, bona-fide customer secured costs very close to $ This figure includes the cost of the samples, and lunches which we furnish the men. These drives a splendid advertisement. The public is afforded an op tunity to learn more about your products, meet mor your salesmen, and see more of your equipment, they possibly could under any other circumstances, a from a visit through your plant. The experience confidence which the men acquire is also a valuable a Due to the fact that we have worked to a great ex

Tomorrow's Standards may be HIGHER than *Today's*

These Burrell-equipped plants are ready—*are* you?

YOUR equipment may meet the standards of today. But what of tomorrow? Standards will be higher. Regulations more severe. Are you willing to buy pasteurizing equipment today—and scrap it tomorrow?

The Burrell-Simplex Long Flow system holds the milk *positively* for not less than 30 minutes, nor over 35—with no loss of temperature in the milk during the holding period. There is *no chance* of intermixture of raw and pasteurized milk, because the machine has no cross-overs, no valves, no dead ends, no elaborate timing devices. There is no mechanism, no agitation. *Nothing moves but the milk.* And because of the simple and inexpensive control devices, the entire outfit can be operated *automatically* with *part of one man's time.*

The remarkable Surface Regenerator effects a tremendous saving in steam, cooling water and refrigeration—and frequently reduces coal consumption as much as 75%.

through the children in the neighborhood, we have found it advisable to make the best use of these campaigns during the summer months when the schools are closed.

Second Plan—Special Soliciting Wagon.

We have taken the route salesman off of his territory, replacing him temporarily with an extra driver, and have given the regular route salesman an attractive horse and wagon and a liberal allowance of samples, sending him out to cover his territory accompanied by one of our retail solicitors. This method, while it requires the services of an extra driver and solicitor, has two distinct advantages. First, it affords the route salesman an opportunity to study at close range the tactics of a professional solicitor. Assuming that your solicitor is a competent one, the value of this training cannot be overestimated.

Secondly, the regular route salesman is more or less familiar with all of the prospects on his territory, he knows the families he has served and lost, those he is desirous of securing as customers, and those he is afraid to serve because of questionable credit. Where your retail business is largely credit this is important. Briefly, the route salesman working with the solictor make a good combnation. We require the solicitor to turn in a report each day, showing the total calls made, the number of new customers secured, the number of "quits" who resumed service, and the amount of money collected from slow accounts. In going over the territory a record is made of the favorable prospects, and the date of which a follow-up call should be made. In this manner it is possible to make a very thorough canvass. Under ordinary circumstances, we found it possible to cover the average route, in from 4 to 6 days.

Third Plan—Systematic Soliciting by the Wagon Salesmen.

The wagon salesmen are required to call upon a certain number of prospects each week, turning in a report to the route foreman, showing the number of prospects interviewed, their names and addresses, and the results of these interviews. The salesman is asked to estimate the number of prospects he can call upon, and is then urged to make that quota in order that his percentage of new business be as large as possible. This plan may be consistently followed from time to time, until each man has thoroughly covered and recovered his territory.

Fourth Plan—Sales Contest.

We recently conducted a sales contest, extending over a period of 60 days. Our retail salesmen were divided into three teams, with a route foreman in charge of each team. Each member of the winning team was paid $10.00, and all other salesmen who had worked in the contest at least 30 days, $5.00.

As a basis for comparison, the average of each man's route in dollars and cents, was taken for the 15 days preceding the contest, and compared against the average for the last 15 days of the contest. The team showing the greatest increase per route, per day, was declared the winner. A great deal of enthusiasm was shown, and it was hotly contested all the way. A substantial increase was shown at the close.

In conducting a sales contest, there are several things which must be considered carefully. The plan must be practical, each participant must have a thorough understanding of it. The contest should not run over too long a period, one that is short and snappy is more to be desired than a lengthy affair. There is always the danger of waning enthusiasm.

Fifth Plan—Special Solicitors.

During this last summer (1926) we employed 5 special solicitors, men who made a specialty of milk solicitation. These men worked as the ordinary to-house solicitor works, going from door to doc pad and pencil. They were competent men, worke and turned in a reasonable amount of satisfactor ness, but by actual comparison, 5 of our wagon sa following our drive plan, and working with the s as I have previously explained proved more ef Each day our men turned in a larger number of I do not wish to belittle the efforts of these specia tors, they were high class men, but in my opinio test proved conclusively, that the competent wago man who is thoroughly acquainted with your bu and follows some practical sales method will render a good account of himself.

High Pressure Salesmanship.

The question often arises in the milk busines high pressure salesmanship pay? Under ordina cumstances, no. There are, however, a number of fied methods which are beneficial when applied practical standpoint.

There are periods in the sales calendar, wh average dairy business falls into a slump, at such some form of sales pressure is necessary. This may be due to any number of causes, weather conc seasons, the general prosperity of the community, lack of proper supervision and policy. From the age concern engaged in the milk business on a scale, there can be recruited sufficient material which to build a sales organization capable of m these emergencies. A number of wagon salesmer proper training and leadership, may be molde "polished milk salesmen." Next to a quality p there is no more potent factor in the success of any enterprise, than a capable crew of wagon salesmen. is no other business where service and quality are closely linked, and there is yet no effective substit personal contact and good-will in selling.

Curbing the Special Solicitor.

The blustering-braggadocio type of special so will very often prove more of a liability than an a the milk business. A solicitor to be successful, m practical in his methods, he must have a thorough ing knowledge of the line he represents; be tact presenting his proposition, and above all else, ho practice. All in all, the efficient wagon salesma sesses these major qualifications, at least to a degre with a certain amount of timely instruction, sho equal to the ordinary emergencies. If you are i of special solicitors, recruit them from your wagon men.

Base Pay for Solicitors.

It is not altogether fair to measure the worth solicitor, solely by the amount of new business cures. He may spend much of his time saving a able customer who has a complaint. The basis muneration for professional solicitors is a perp problem. Where the pay is based on production there is a tendency on the part of the solicitor to orders at cut rates, or to extend questionable c where the salary is paid at a flat monthly rate, th offered no incentive for increased production. A medium may be found in same sort of guarantee, basis.

The Good Will of the Medical Profession.

The good will of the medical profession is a valuable asset to any dairy concern. With them, ing is believing." To make a booster of this profe see that they are invited to inspect your plant, an your plant is worthy of inspection. Put out a pr they are willing to recommend, and pay strict att to their complaints. Cultivate their good will.

adoption of a policy of business reciprocity, is one effective method of winning and holding the good will of this profession. Distribute your sick and accident cases among the various groups of representative doctors in the city. Selecting different groups at regular intervals.

Souvenirs.

The possibilities of securing new business through the distribution of souvenirs is somewhat limited. The public have I believe, come to regard with at least a small amount of suspicion, anything that may be offered with the idea that they are getting "something for nothing." Useful souvenirs may be distributed by the wagon salesmen, but even this practice may place the salesman in an awkward position. He may have given Mrs. Jones, the newcomer, a souvenir, only to find that his old customer who lives next door, has been overlooked and, of course, feels slighted; there you have a complaint.

It is a distinct advantage to carry a complete
dairy products on retail wagons. It affords mor
one opportunity of making a sale. The wagon sa
who carries butter, cottage cheese, milk, cream
olate milk, buttermilk, and a complete line of
products, has some one product that each and
prospect uses. If you sell a customer milk, why sh
you sell all of her requirements in your line? Th
some customers who do not use fresh milk, but w
butter. Our butter sales on retail wagons trebled
we began delivering direct to the home.

In closing permit me to say, that we have fo
short cut to success in the dairy business, no mys
methods or formulas, but rather an industry, re
above all else, a generous amount of hard work
mon-sense and tact. It's 99 per cent perspiratio
1 per cent inspiration.

Breakage of Bottles in Milk Plants

Comparison of Bottles of Various Sizes

THE table below shows the number of bottles of various sizes broken out of each 1,000 filled at nine plants located in the Southern and South Central States. The broken bottles of each size were kept separate, and the results are daily averages for five-day runs. The table also shows what per cent of the total number of bottles were filled by quarts, pints, and jars.*

It will be noted that at six of the nine plants more pint bottles than quart bottles were broken out of each 1,000 filled; at five plants more jars than quart bottles; at seven plants more pint bottles and jars than quart bottles; while at six plants more jars were broken than pint bottles. Thus, as a general rule, breakage of quart bottles was relatively less than that of the smaller bottles.

Of course, the smaller bottles will not break so readily as the quarts when subjected to the same blows and the same amount of pressure, but the data obtained in these studies indicate that the smaller bottles are subjected to more strains and falls while in the machine. The small bottles give more trouble in the bottle washers and fillers than do the quart bottles. The former often stick in the filling machines, especially when being filled with cream, and the pressure in the bottle washer sometimes forces them out, whereas quart bottles usually give no trouble in this respect. In ha
on conveyors and trucks there is also a tenden
more of the small bottles to fall out of the cases.

The quart bottles have a tendency to chip more
than do the smaller bottles. At one plant (repor
Milk Plant Letter No. 149) the number of chippe
tles thrown out for a period of eight days was as fo

Quarts ....5.6 per 1,000 filled
Pints ....4.6 per 1,000 filled
Jars ....2.5 per 1,000 filled

CLLEGE STUDENTS DRINK MUCH MILK.

Bekeley and Palo Alto, where are situated the Uniit of California and Stanford University, have the es per capita consumption of milk in the state, acir to figures received by Sam H. Greene, secretaryr of California Dairy Council, from the state a of dairy control.

ng 1926 college students and others living in to consumed on an average of 1.35 pints of milk y. In Berkeley the average daily per capita conpton was 1.25 pints. Long Beach and Glendale tied th d place with an average of 1.16 pints. Other n the list having an average daily per capita sution of more than one pint are: Sacramento, pits; Los Angeles, 1.04 pints; Pasadena, 1.2 pints; h Pasadena, 1.5 pints; Ontario, 1.07 pints; Redlands, is.

e greater consumption of milk in the college nities shows that the younger generation is awake c alue of milk in the diet,'' says Mr. Greene. ''The student has a penchant for malted milks, ice m and milk shakes, and the consumption of these s creases materially the use of milk.

ientists advocate the use of at least one quart ni a day by every man, woman and child in the e States. When we reach that goal we shall be a ngr and happier nation.''

Acording to the report of the bureau, there are 45 roed milk inspecting departments in California ping 240 cities and towns.

* * *

A Y FIRM SHOWS SUBSTANTIAL GROWTH ON FEATURING SERVICE.

Ni years ago a modest little dairy was born in the c Cleveland, and the entire handling for a whole ws ten cans of milk. Today this plant is handling cs daily.

Th remarkable part of this fact is that no salesmen e nployed to build up this business. It was done o on service. One customer told another of the ic the Producers' Milk Company was giving them, o quality, and that brought more and more business e uiet-working, efficient firm.

Toay they are buying and selling 1,000,000 pounds u er annually, operating three freezers in their ice m department and handling 400 cans of milk, disutig to 18 routes in the city of Cleveland.

Thir own trucks go after the milk daily to the ne patrons. Sometimes in three hours after the s e milked the product is in the plant and on its ging through the process which makes it safe and ty for the consumer. The Cleveland law is to label mk within 24 hours of its pasteurization for its sale fowing day. The Producers' Milk Company is a ead of the pasteurization law, for its milk is on w to the customer the same day and its label reads h following day's date. Mr. Thomas, manager of cnpany, stated that ''that was delivering tomorsmilk today.''

WHO PAYS FOR ADVERTISING?

Avertising pays for itself. The more a good product dertised, the greater are its sales, which reduces ucturing cost and creates a lower price to the cone—Barron Collier.

More Customers

Handbags have handles
—so have CERTIFIED CAPS for Milk Bottles

Customers follow better service. They want bottle caps that are easy to lift off. You can give them just that, at trifling cost, if you use Certified Caps.

Certified Caps for milk bottles have tough red fiber flaps, stapled on. They are easy to see, easy to grasp. They do not tear. They lift the cap off whole, every time. Perfect for capping machines or for hand capping.

We can prove that Certified Caps with Red Flaps bring bigger profits. Make us do it.

Write us, or ask your jobber for free samples.

Mediums for Advertising Milk

Newspapers, Street Cars, Billboards, Pamphlets, Store Displays, etc., all Come in for Attention at Milk Dealers' Convention.

AT THE Detroit convention of the International Association of Milk Dealers the generally accepted means for advertising milk came in for a free and full discussion. We have grouped the papers read there as follows and we commend them to the careful attention of our readers.

THE ADVERTISING MESSAGE.

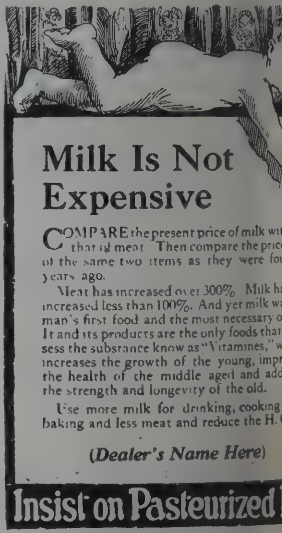
C. O. Ewing.*

The first question for consideration in discussing the advertising message is what kind of an audience you expect to reach. The audience naturally divides itself into two classes; first, those who are already your customers and second, those people who are not. The major portion of the advertising appropriation is usually spent in an effort to reach the group of people who are not customers. Obviously the object of this advertising is to secure new customers and to make it easier for a salesman to secure them by personal solicitation. The media employed in this work are usually newspapers, posters, painted bulletins, street car cards and we might include, movies and the radio. The message for this advertising should contain reasons why the goods and service of the advertiser are preferable to any other. The service which most milk distributors give deserves quite as much emphasis as do the facts concerning the superiority of their methods in handling milk. The complete story, "From Cow to Consumer," should be told and retold, bit by bit, from as many viewpoints as possible. The care used in the selection of the farmers who are supplying the milk and the supervision given it on the farm, then the rigid inspection and testing of the product when it reaches the bottling plant. Then the story of the laboratory and its constant, thorough supervision in checking up all processes. The refrigeration necessary to keep dairy products in good condition should be emphasized at all times not only to impress the consumer with the care exercised by the company but to suggest to the customer that milk should always be refrigerated in the home. Then the story of the service with all that that word implies; the prompt delivery three hundred and sixty-five days in the year, the convenience of the easy order blank or note in the bottle and the telephone and special delivery service and numerous other items. The field affords an abundance of material for the milk distributor to keep constantly pounding away and it seems to me that if these facts are put over we should not expect to accomplish any more with our advertising intended to reach non-customers. This leaves the vast field of the food value of milk entirely untouched and it is my opinion that the milk dealer should use this material in direct advertising to his customers, working exclusively on the food value and health giving qualities of milk for old and young, making suggestions for recipes and menus. A great deal of this work is being done by the National Dairy Council, by our public schools, our doctors and nurses. The distributor should merely tie up his program of direct advertising with whatever work is being done in his particular locality. Everyone, of course, understands that the material for the advertising message has been presented in a very dull and prosiac way, that in order to get these facts over to the public they must be told in many di
ways and only one idea or fact at a time. In shor
must be made into good advertising. Unsupportec
ments such as Jones' milk is the best milk sho
avoided and rather state some fact why the milk
perior which will suggest to the prospect the supe
of the goods. Advertising like personal salesman
built on confidence and obvious boasting does not
lish confidence while a plain statement of facts v
most invariably appeal to the open-minded. To s
the point of this paper is simply that in adve
directed to non-customers tell the story of superio
goods and service, when we are talking to our ow
tomers tell them how valuable milk is and how
attractive ways it can be used to the end that two
can be used instead of one.

NEWSPAPERS.

By Will A. Foster.*

The first point I want to get to you if I can i
there is nothing mysterious about advertising.
not hard. It is not complicated, and it does no
to scare anyone at all. It is simply putting dov
mass reading the same things that you would say
had a customer right across your desk. Now, let
the picture first, so that we will realize how simpl
and what we have to meet when we start in on an
of advertising. Take your own home, any home, an
ican home. A man, his wife, and two children. The
a milk man. They have had one for four or five yea
has given them good service and all that. The goods are satisfactory. They get their bottle of milk in the morning and bring it in. If you will just keep in mind that family of four, I think that you can plan your advertising project a litte bit more carefully. Here they are. They bring it in for breakfast.



Milk Is Not Expensive

COMPARE the present price of milk wi
that of meat Then compare the pric
of the same two items as they were fou
years ago.

Meat has increased over 300% Milk ha
increased less than 100%. And yet milk wa
man's first food and the most necessary o
It and its products are the only foods that
sess the substance know as "Vitamines," w
increases the growth of the young, impr
the health of the middle aged and add
the strength and longevity of the old.

Use more milk for drinking, cooking
baking and less meat and reduce the H.

(*Dealer's Name Here*)

Insist on Pasteurized

Well, the first thing we have to consider is that it be taken in promptly; that it be used properly in the home. Then you run into the first peculiarity of American homes.
Perhaps one of the two children likes milk and c
it, and perhaps the top milk is poured off fo
cereals. Perhaps the mother never drank milk sinc
was a little girl. Perhaps the father likes it on his c
or does not drink it at all. So you have first to co
the American home, and that is back of your advert
whatever it may be, and your methods of conduct
must be based upon the situation as you meet it.

I wrote to 160 newspapers all over the United S
practically every state in the Union, and asked th

Save a ton in Weight!

very pound saved in veight of the tank quals two pounds f pay load

THUS 99% Pure Nickel Milk Tank construction saves you 2000 pounds deadweight and adds 4000 pounds payload.

The reason for this outstanding advantage is that 99% Nickel is inherently stronger than steel and permits us to use much lighter nickel sheets which results in a nickel tank construction that averages one ton less weight than any units, heretofore, used.

Combine this weight advantage with the sanitary advantages of a one-piece seamless nickel construction and you have two excellent reasons why 99% Nickel Milk Tanks are generally preferred throughout the dairy industry.

Let our engineers co-operate with you.

send me sheets from their current papers carrying samples of fluid milk advertising. Those are hung up. There will be no comment or criticism of any advertisement there, but they do get over certain points. You have some in color. You have some rotogravure. You have some cashing in on a news incident. You have some using art work, some talking pasteurized milk, and all of them typical of the advertising that is being carried on in its every day work. The only object and purpose of those is to give you one or two ideas which you may take with you and carry into execution. The types of advertising are just as many as there are methods.

So, with that little background, we sort of swing into a consideration of the whole question of advertising methods. There is no best medium that I know of. The thing that you have to consider first of all is where you want to go, and if any man who sits down to plan an advertising campaign or build a budget, builds it under any other consideration than that he wants to go there in a certain length of time, he will not get the maximum value from it.

Now, what have you got to advertise? Get a bottle of milk. That is what the customer sees on the back porch. Did she see purity? No. You can't see purity in a bottle of milk. You might see a cream line. You can see a cream line. She sees the man. She sees the bottle. Can she see all the things you do to it? No. I am not so dog-gone sure, men, but what we are wrong when we put too much effort on telling the public what we do to a bottle of milk. Does the public care what we do to a bottle of milk any more than you are interested in what they do to the suit of clothes you have on? You do not know whether it is mercerized, or whatever it may be. Are the public primarily interested in what we do to a bottle of milk? No. They are interested in what it will do for them. Now, I do not know why. I think we have all overlooked a big bet. You just came from the dinner table. You have read a whole lot about health. Every man here, has read about vegetables, and so forth, and so on. How many men made a choice on their menus today because of something they thought was good for them? How many? Be honest. One out of ten. All right. Listen, any dairy product that is on a dairy wagon, milk, cottage cheese, butter, eggs, or anything else, goes down here. (Indicating). Ninety-five out of a hundred people eat the thing they like. That is the thing we have to get over to the American public, and the child who drinks its quart of milk a day up to five or six years, the thing we have to keep in mind is how dog-goned good it is, because if the taste is created, the appetite follows along. A bottle of milk. That is all it is. You can't see purity. You can't see cleanliness. You can't see a lot of these things that enter into a bottle of milk. But, we can't emphasize perhaps what it does for them in the way of specific things.

I took a current issue of the largest national magazine in the United States and I counted the advertisements in that particular publication. Twenty-seven that I counted used either directly or indirectly the health appeal. It has been used and it is used very widely. It is an indefinite and abstract thing at its best. I think we can and I think we do have a practical argument in the bone and tooth structure, because that is awfully definite. There is something that is very personal in the development of that particular phase of the human stature.

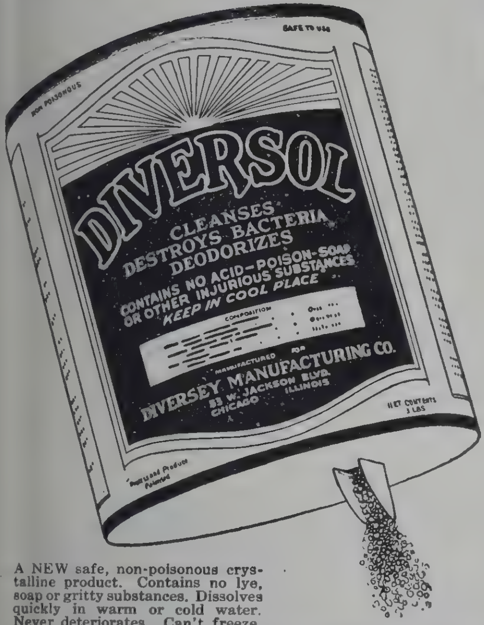
A bottle of milk. Let us keep the thing simple and not too complicated. Write it and put it in your desk. Take it out the next day and see if it is as good as the day you wrote it. If it is, the chances are you are all right.

Now, we will swing over into the methods. What have we? First, consideration of the one to which I am assigned is the newspaper, newspaper advertising.
Men, when you sign up with a newspaper for so
inches or lines of space, you have not done any
under God's big sun but pay for the privilege of s
something. The fact that you have signed for th
vertising does not mean a thing any more than t
might pay carfare to call upon a prospect. I hav
complished nothing. I have the opportunity. No
ter what that medium may be, newspaper, or any
else, it is what you say and how you say it, an
timeliness with which you say it that carries w
You will see some of those things brought out very
ly in the exhibit of individual copy on the line.
what you say and how you say it.

Newspaper advertising. I am going to read pa
the paper now, because it fits in well here. Becau
the influence of the weekly and daily newspaper o
life and habits of the American public, space with
columns must form the backbone of any adver
salesmanship for fluid milk and cream. The local n
of the paper denies it the privilege of the use of na
magazine advertising with highly finished paper
color treatment. I will analyze the advantages and
tations of newspapers. because it has them both.
only considering the fundamental and not actual
used in a given city, or when to use it, because
things must be determined by the application of
mon sense to the situation as it is. The criticism
newspaper advertising for fluid milk are known
readily admitted. The life of the daily newspap
weekly is 6 to 24 hours at the most. You also ha
consider the position of news for the attention o
leader, competition of bargain and price appeal co
department stores and other institutions against th
price product such as milk, and it costs money.
comparatively short life of a newspaper need not
cern any one particularly, because the good adve
ment should and can be made to gets its message
in 20 seconds. The next time you drive along a
check yourself in your car against some of the billbo
road signs, and other things, just for fun and see
many words you can read in the time that you are
ing. Not much over eight or ten at the maximum.
competition of the news appeal of the department s
bargains, and other things, is probably the hardest
petition that the milk man has to meet in a newsp
and I am wondering if we can meet it best by the
use of copy illustration if necessary, lay-out, and t
that have as good an interest as the news in the ad
ing column. Newspaper advertising offers an o
tunity to make a talk in print to a given numb
people. You bet it costs money and if you will sit
before you shoot it for a final insertion and figure
it is costing you from ten to fifteen cents a word, m
more, for every word you have in there, you will
ably eliminate a few before you get through, if the
calls for that sort of treatment. It costs money, an
after all, the way to figure all these things out is wh
costs per person. Figure out what the space the si
a letter head, inserted in any newspaper will cost
divide it by the circulation, which will give you the
per thousand. Frequently the higher the price o
paper, the lower the cost of reaching the reader.
not the cost per inch that costs, it is the cost per thou
readers. That is the basis of judgment, all other t
being equal.

Now the newspaper has certain definite advantag
an advertising medium. Some of them I do not al
think of and I will give the ones that seem most
portant. It has a definite, consistent circulation
can be reached at stated intervals with any messag
24 hours notice, a stated definite audience. I mea
that the same readers, as a rule, today and tomor
It is an inexpensive opportunity to present news

NEW! For Milk Plants



A NEW safe, non-poisonous crystalline product. Contains no lye, soap or gritty substances. Dissolves quickly in warm or cold water. Never deteriorates. Can't freeze.

Write for FREE Sample

INSTANTLY Destroys the bacteria that spoil your product

DIVERSOL

1—Cleans. 2—Destroys Bacteria
3—Prevents "off-flavors"

Does All 3 with ONE Operation

Diversol is a wonderful NEW product that combines in ONE product the properties of a (1) cleanser (2) sterilizer (3) and deodorant. Does all 3 at one time—ALONE! Diversol is *more* than a washing compound—it destroys bacteria as it cleans—and removes all odors . . . . cuts grease . . . . softens water . . . . never injures hands . . . . safe . . . . non-poisonous. Diversol is very economical—one pound makes 100 gallons of sterilizing solution. Does not lose its strength. Diversol destroys bacteria with cold water, mind you, that even steam misses. . . . . One wash or rinse with Diversol and your equipment is *instantly* rendered fresh and clean and free of bacteria and odors. Think of the time Diversol now saves you. No man producing or handling milk or milk products today can afford to be without this great NEW product that has taken the whole country by storm.

When writing to DIVERSEY MFG. CO. *please mention The Milk Dealer* or items of interest concerning the products, service or organization of the distributor.

The prestige of the newspaper in the home strengthens the morale of your own employees and extends even to the producer of milk. The advertising message is something that to my mind is very important. The advertising message in a newspaper is usually read under such conditions that prompt response to the appeal can be secured by the reader stepping to the phone or to the door. In other words, you are giving the story under such conditions that the action can be taken. The customer may phone you. It is right in the home. Or, she may call in the man in the neighborhood.

Here is the second big thing. Newspaper advertising talks to a greater market for milk than the buyers themselves. The mother may buy the milk for the home, and she does. She may buy it, but she may not drink it herself. She is therefore guided in her purchases by the opinions of all the members of the family. Now, to enlarge on that point. I mean just exactly what I say. The woman buys the milk, but only about three out of ten drink it. If the taste is the basis of judgment, then if we talk to the twelve-year-old daughter, or son, the father or the grown up man, who is eating in the home, he may say, "I like this or that. Why don't you try this? Why don't you try that?" In other words, most women buy and cook and prepare to please the members of their family and the newspaper advertisement reaches the young as early as six or eight years, through all ages, and they, after all is said and done are the users of the milk. The market for milk is constantly changing by births, deaths, marriages, moving and other factors. An interesting message consistently presented is unconsciously influencing this ever changing market by consolidating the present basis of paving the way for the growing up market. I do not know how many of you men have found out or know what your turnover is of customers. We talk of labor turnover. What percentage of your customers turn over, move, break up housekeeping, stop being buyers in the course of a year? If you have made the investigation, your hair will be grayer the next morning because the figure is one that is really worthy of serious consideration. Then you are unconsciously and constantly making an impression regarding your product or your service to the market that today may not be buying and tomorrow it may. Here is probably the greatest value of newspaper advertising of all, and that is this; that it confirms the implied contract. Get it. You do business. You buy goods and you sell goods. You buy them on a contract and you sell on a contract, price, delivery, and so forth, mentioned. Newspaper advertising confirms the implied contract which every reputable milk distributor must maintain with its public that he will give them good goods and adequate service on a fair margin of profit. It carries with it when you buy space and constantly remind the public of that obligation. And what is more the perfectly righteous belief we have in our own superiority set down in black and white, is by far the most effective of any known agent in making us constantly improve to be as good as we tell them that we are. Ninety per cent of the value of the advertising is not on some customer that you have got, but it is on those that you serve. It stills gossip regarding your product. It makes your own men tell what you have told by signing your name to it, and it helps in that way to maintain a uniform presentation of sales argument.

Now, do not gather from this paper that I believe in newspapers as the only medium. I do not. The other media will be discussed here. It is a question of the conditions surrounding each man's own business, his own locality and so forth, but with good products and good service, well trained route salesmen, because without the goods and the man, no advertising can ever succeed. A sound advertising program for any distribu be built with newspapers carrying the burden tailed sales argument, with billboards, signs, cards carrying the slogan or name and suggest vertising by specific appeals to your own custom specific grades, for certain products. Prepar executed, such a program will pay its way and the permanency of profits in years ahead. The bi to remember is that there is nothing hard about tising. There is nothing mysterious about it. T trouble is that I believe that we do not give a time to the preparation of copy as we should. want it in the morning. We sit down and write we shoot. We forget that we are so wrapped products and all the things that we do, that we paint something that is in it that the custome never see in a hundred years. She only sees the She drinks it or eats the dairy products because or tastes good and satisfies her hunger.

No advertising can ever succeed without fi goods, second service, and route distribution. vertising of any kind, will ever do, is hasten the ment and growth of a company that would ha ceeded without it. It can never do more.

ADVERTISING WITH CAR CARDS.

By D. S. Horton.

Most of us are quite familiar with this me publicity. The old saying, "Everybody rides an body reads," is very true.

Car card advertising is a big space medium. cards, with the exception of a few special cases standard size, being 11x21 inches. Compa magazines, the car card is about twice as large a page in the national weeklies.

Preferred position for one's advertisement i thing that every advertiser desires when he uses s periodicals. Back covers, food pages next to matter, are preferred positions, much sought aft advertisers usually don't get these special positi cept by paying an extra cost. In the car card the situation is entirely different. The standar are not scattered about the interior of the car, one preference over another. Instead, they are laid an orderly manner. They are placed end to e single line, parallel with the length of the car. count of the location of the cards they cannot be hidden from view in any manner. There are no " positions." Each card is a dominant, full size tisement. A feature worth mentioning is the fa the companies leasing card space generally make fort to place a light card next to a dark one, a versa, and to keep the competitive cards separat

MORE PROOF!

of the SUPERIORITY of the

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**

as many very famous food products are advertised in the cars regularly. There is ample room on a car card to print the product's name in big, bold letters, and at the same time tell a brief sales story. The messages on the cards are selling facts boiled down to their ultimate meaning, and presented in such a way that the reader can absorb them in a single glance. All colors can be used, and this is one of the big features of the medium. Really fine art work and good lithography attracts more than passing attention. Car cards are read voluntarily, and they are a relief from the tedium of traveling and waiting. We frequently find ourselves studying them.

We receive many letters about the cards. A particularly good art design will bring requests for copies. Many school teachers use car cards in their classes.

Repetition is a big feature in car card advertising. They are there every hour of the day. A system of transfers, or changing from express trains to locals—the cards are always there to greet the passenger. Riders are numbered by the million. In New York City the Interboro Subway and Elevated system transports over three million passengers a day, or more than 1,100,000,000 a year. This is a tremendous circulation.

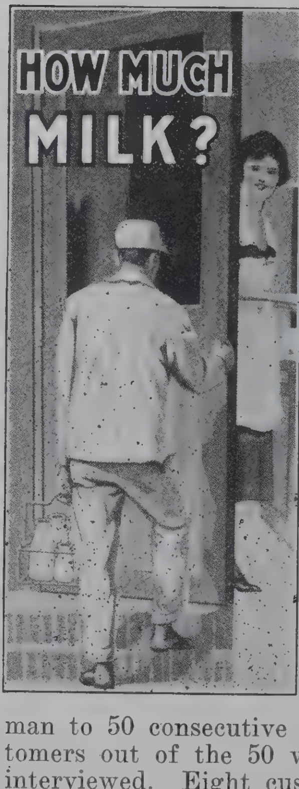
That car card advertising pays is almost self evident when we see in a car such names as Heinz, National Biscuit, Maxwell House Coffee, Colgates, etc. There is but one conclusion to come to, and that is, that car card advertising is a profitable medium.

Billboards and outdoor displays, the other section of our subject, is something else again—and we will touch on them in the future.

PAMPHLETS.

By F. R. Moore.*

This is a subject that is quite broad and it took a lot of work. I do not know as I have got much out of it to help you fellows, you ladies and gentlemen, but we will see what we can do.



HOW MUCH MILK?

Now, in order to get this information, I conducted surveys on pamphlets and bottle hangers. We have not gone into the pamphlet way of advertising milk very strongly. Consequently I took a pamphlet from the Franklin Chocolate Malted Milk Company, one that we used, and a bottle hanger from the Franklin Chocolate Malted Milk Company, and a pamphlet from the National Dairy Council, which pamphlet is very good.

Survey on Franklin chocolate malted milk bottle hangers conducted in Grandview, a suburb of Columbus, O. This territory is not considered a high aristocratic neighborhood, but is generally thought of as containing a very good class of people, mostly home owners.

There were 50 hangers distributed in this neighborhood by a competent route foreman to 50 consecutive customers. There were 42 customers out of the 50 who received hangers and were interviewed. Eight customers out of the 50 were not at home, and consequently were not interviewed

These questions were asked of the people: This route foreman passed the pamphlets and bottle out and we afterwards interviewed each person.

Question number one. Did you receive bott er? Forty-two customers out of 50 received Thirty-two customers out of forty-two receivin hangers, read them.

Question number three. Why did you rea hanger? Thirty-two customers said they read t cause they were interested to see what we wer tising. Ten receiving them did not read them, that they were not interested or did not have ti

Question number four. Do you think bottle are a good way to advertise? Strange to say a two persons interviewed said they thought thi good medium of advertising, although ten of t not read them.

Question number five. Do you dislike bottle on your bottles of milk? This was answered by a two customers that they did not object. The asked that was that I have heard our men expl people did not like advertising because it littere porch and yard, and I wanted to find out if that absolute fact.

Question number six. Did you purchase a Franklin chocolate malted milk after reading Twenty-one customers out of forty-two receiv hangers purchased a can.

Question number seven: Do you think you chase later on? Of course, we cannot tell wheth did or not. Thirty-two customers who receive hangers said they thought they would purchase l

Question number eight: Which do you r most, bottle hangers or pamphlets? Twenty-one forty-two persons said they read bottle hang most, although there were only thirty-two who them. They thought they were picked up by th wife due to the fact that they were over the b milk.

The final data on these hangers in this pa neighborhood is that there were 42 per cent sale distribution of advertising. This we consider qui and with future prospects of twenty-two per cen

Some of this, of course, you will have to o I put it down just as I got it, because I did not patch anything. Forty-two of those persans sa were good advertising, but only 32 of them read

Survey on Franklin chocolate malted milk ha another territory of the south end of the city whi sisted of a class of people mostly foreigners.

Fifty bottle hangers were passed out to fif secutive customers. In this survey the same was asked. Did you get bottle hangers? Forty out of the 50 were interviewed. Thirty-seven received the hanger.

Question number two. Did you read bottle Thirty-five out of these thirty-seven read them.

Why did you read bottle hanger? Thirty-fi various reasons, such as they were interested in milk advertisements as food, also they were int in the advertisement of malted milk as a food. who did not read the advertising were such th could not speak or read the English language.

Question number four. Do you think bottle are a good medium of advertising?

Thirty-nine out of forty said they thought the

Do you dislike to see bottle hangers on your of milk? Nobody objected.

Did you purchase a can of Franklin chocolate milk? There were five purchases in that territor

Do you think you will purchase later on? said they thought they would.

Which do you read the most in advertis

pamphlets or bottle hangers? Thirty-one said bottle hangers and nine said pamphlets.

The final data on these 50 bottle hangers was 10 per cent sales and prospects though the distribution amounted to 14 per cent.

Now, there is considerable to this. I won't go through it all, because I will just read one of each survey and then give you the final data on all of it.

Then we conducted this final summary of the surveys. The final figures on these three sections by the route foreman was the distribution of 150 bottle hangers was 100 per cent due to the fact that a special man was on the job. Eighty per cent were received; sixty-five per cent of the bottle hangers were read; twenty-five per cent caused sales immediately; forty-two per cent possibilities of future prospects.

Out of 100 per cent distribution of pamphlets seventy-six of the pamphlets were received; forty-eight per cent were read; 18 per cent actual sales caused by pamphlets; 36⅔ possibilities of future prospects.

On the baby pamphlets of the National Dairy Council, 100 per cent were distributed. Out of this 100 per cent distribution, 70 per cent were received by customers; 48 per cent were read; five per cent of customers used more milk after reading. I believe that more were not read due to the fact that I believe they are a little large and have a little bit too much reading in them. That was the reason that a larger percentage was not read, although I am not authority to say really.

Now, on these pamphlets, we consider that there is always a lot of contention and trouble when you go and give them to your man to distribute, due to the fact that it is extra work, and they dislike to do it. You can't do it in bad weather. It must be on a day that is decent for them to be distributed. I, myself, am not very strong on pamphlets and more so since I have made this survey, but I do believe that a bottle hanger that has a short message has considerable good in it.

We conducted a whipped cream contest and we had bottle hangers explaining how to whip cream, and what good dessert it made, and of course, the men were very enthusiastic over this contest and they distributed these bottle hangers very good, and they made a big hit and caused us to sell quite a bit of double cream.

Now, in the summer I run a bread and milk ad on a real hot day on one of these bottle hangers. The message was short. It got there and I believe it did us a lot of good, and at that time there was a contest on. I believe that you must have, when you distribute any such advertising through your men, I believe that you must have them sold on it. The only way that you can have them sold on it, I believe, is to have a contest of some kind, for them to have a special reason for distributing them. Otherwise about 50 per cent of them will go into the sewer and stop the sewer up, or be dumped in somebody's front yard. There is an awful lot of money spent for pamphlets and literature that never reaches the house, and consequently can't do any good, but it does do good if you can give the men a cause to do it, and I believe the only way that can be done is like I said, to have a contest of some kind that will create a pleasurable cause for passing them out.

STORE DISPLAY ADVERTISING.

By F. T. Cook.[*]

In most instances the experiences of various dealers have been much the same. They have, of course, differed to some extent as conditions in all cities are not alike.

From responses I received to the questionnaires sent to a number of sales managers, I have concluded that money spent for store display advertising is well invested **only** when used in advertising ice cream or specialties such as butter, cheese and whipping c It can be used to advantage in an effort to encoura use of a delicacy, but not a necessity which is in dail

The Market and the Medium, published by the can Newspaper Publishers' Association, states a lows: "Market cultivation has become a standa phrase in national selling. It marks a comparative cent realization that it pays to sell merchandise and when people want it and have the money to bu

In advertising dairy specialties, the store displa vertising has an advantage over other advertisin bringing the modity advertis the attention o housewife at place where it c purchased, and time when she a frame of min ceptive for su tions of pur The question whether or no going to exc her money or line of credit for merchandise has predetermined. One obstacle to the sale has the been removed.

MILK
MILK
MILK FOR HEALTH

As to the value of a dollar spent in advertising termined largely by the number of people who se advertisement, location of display is a large facto

As a rule the grocer does not occupy a prom corner, and, unless it is at a busy corner, compara few people see the window display excepting patr that individual store.

Another problem to be solved is that of keepin appearance of the display in such condition as to credit to the business.

Our merchandise is perishable. If merchandis play is to be used, it must be renewed daily, and, treme weather, even oftener, or it becomes unsigh

If display cards or merchandise cartons are care must be taken to see that they do not become and fly specked. Dairy merchandise is so closely re to sanitation that extreme care must be taken to se the appearance is right or the display becomes strong adverse advertising.

Some firms use painted signs on windows. problem is to secure permission of stores in good l ties to use the window. The advertising value of a on stores located on back streets with poor surroun is questionable.

Mechanical devices showing action will always attention, and are good mediums of advertising at times as a large crowd passing the window can sured. However, unless there be a convention of kind which will attract unusual crowds, or the d can be placed at a transfer corner which is always the expense is rather out of proportion to the be derived.

One question to be decided in connection with display advertising is whether or no the dealer w to encourage store sales at a possible expense of wagon sales, or whether the store milk business sh only care for extra milk and cream which the hous may decide to purchase after the regular deliver been made.

It seems to be the opinion of many dealers with I communicated, that store display advertising w tend to divert wagon sales to store sales.

In conclusion, will say that I believe store di advertising can be used to best advantage by those are in the ice cream business. The average drug

View of Miller-Hydro at the Roseland Dairy, Chicago, Ill.

The Great Step Forward in Bottle Cleaning Methods

IN every large dairy the Miller Hydro will save several thousand dollars in salaries alone during the first year of its operation. It will completely eliminate bottle breakage and wastage even in handling an output of 2500 cases a day.

Figure what these savings will amount to in your own plant. Then consider along with the savings that over 3500 dairies, breweries and bottling plants of enormous capacity have pronounced the Miller Hydrostatic way of sterilizing bottles superior to any brush washing method that has ever been devised.

You can do away entirely with brush contamination, broken bottles and expensive replacements by installing a Miller Hydro. No other bottle washing machine made can equal its performance. It will pay for itself in your plant before you make the last payment.

Let us show you the many advantages of sanitation and economy that the Miller Hydro holds for you. Write today for complete information and list of large users.

where ice cream is sold is usually better located than the average grocery. Therefore, the advertising would be displayed to better advantage and reach a greater number of people than would grocery store displays.

Unless introducing a new commodity or featuring some seasonable commodity, the dealer who is strictly a milk and cream distributor will do better to invest in other forms of advertising.

PHONE OPERATORS AND ORDER CLERKS—THE VOICE WITH THE SMILE WINS.

By F. E. Boyd.*

The telephone is still a comparatively modern instrument and most of us have much to learn to give it its most efficient scope. Telephone companies are demonstrating its facility in developing business as well as its low cost. In spite of aggravating delays and mistakes in handling calls which the telephone service is still subject to, it would be impossible to conduct modern business without it, and because of this it deserves considerable attention. When the prices of a number of merchants are equal, **service** is the **deciding selling** factor.

I presume we are all agreed on these general principles but, judging from personal experience, many firms have not given the subject the detailed attention which its importance warrants. One common fault is to hire someone without telephone experience and put them at a desk with the instructions "Take care of the telephone." Under such conditions it is not to be wondered at that telephone conversations are sometimes unsatisfactory. Careful instruction is essential to intelligent telephone operation.

There are several things which we can arbitrarily say cannot be omitted from the requirement of a satisfactory telephone salesman; and it should be remembered that everyone in our factories who is called upon to answer the telephone is a potential salesman.

First, I think, comes clear enunciation. An operator is of no use if what is said cannot be understood.

Second is courtesy. It is impossible to estimate the amount of good will a concern receives from the courtesy of its employees, but it is a very appreciable amount and well worth the time and trouble taken in assuring yourself that your employees exhibit that characteristic. Insist that it be cultivated, and remove anyone who will not do so. Many serious complaints may be satisfactorily adjusted through a courteous attention to the recital of the complaint and the assurance that, if possible to prevent, it will not be allowed to happen again. Many a trivial complaint has resulted in a lost customer because of the manner of receiving it.

Under courtesy, I would include a pleasant voice with some snap to it. Judging solely from the sound of their voices, some operators have at least one foot in the grave. On the other hand, too much slang and a slip shod enunciation must be avoided. Sometimes a telephone call is just an interruption in an interesting conversation in the office and the operator attempts to answer the call with a mind full of other affairs, or tries to maintain a double conversation usually with very poor results.

Third, the telephone should be answered as soon as possible after ringing. We are moving in a speedier world than our fathers and must catch up with the times in answering. We, none of us, like to wait at the telephone and won't wait very long. Also, the operator doesn't ring many times before reporting "They don't answer," and that lost call may mean a lost order, perhaps even a series of orders.

When the receiver is lifted off, the name of t
cern should be spoken clearly and if there are
more departments, the name of the department
follow the firm name.

As far as possible, the customer should be allo
do the talking except as may be necessary to k
conversation close to business. One particular
where the worth of an operator is shown is in the
ty with which calls can be taken without sac
courtesy or full and accurate information. If
orders, questions should be asked which will brin
information without waste of time. The order n
taken accurately, however, and accuracy is, I thi
fourth consideration. Having given an order, t
tomer expects to have it filled and is not inclined
cuse failures. Quantity, variety, time and plac
be exact and written so that the order may be r
whoever may be responsible for shipping and deli
The operator should also be accurate in the infor
given and after a short experience should know t
eral trend of questions asked and keep posted o
matters so that there is no delay in answering.

There are undoubtedly times when it is alm
possible to keep one's temper. Remembering, ho
that "The customer is always right," try to la
yourself when you feel like cussing and you'll
prised how many times that clears the air. If
that, it is impossible to hold in any longer answer
ing, "I am sorry that you feel that way." It is i
of trouble that the good operator shines most,
rush spells or at times when things are not going s
ly, by answering the telephone in the same cool,
ous manner, but the day after day calls are just
portant, perhaps more so, as we are expected to gi
ter service during normal times.

Expect super-service from your operators, b
until you have told them clearly and in detail, jus
you want, and you must expect to be able to demo
what you ask. In fact, one of the best ways to tr
new operator is to have them listen to one who
you want with the proper explanation as to w
want it.

And finally, all conversation with customers
end "Thank you for calling" or simply "Thank

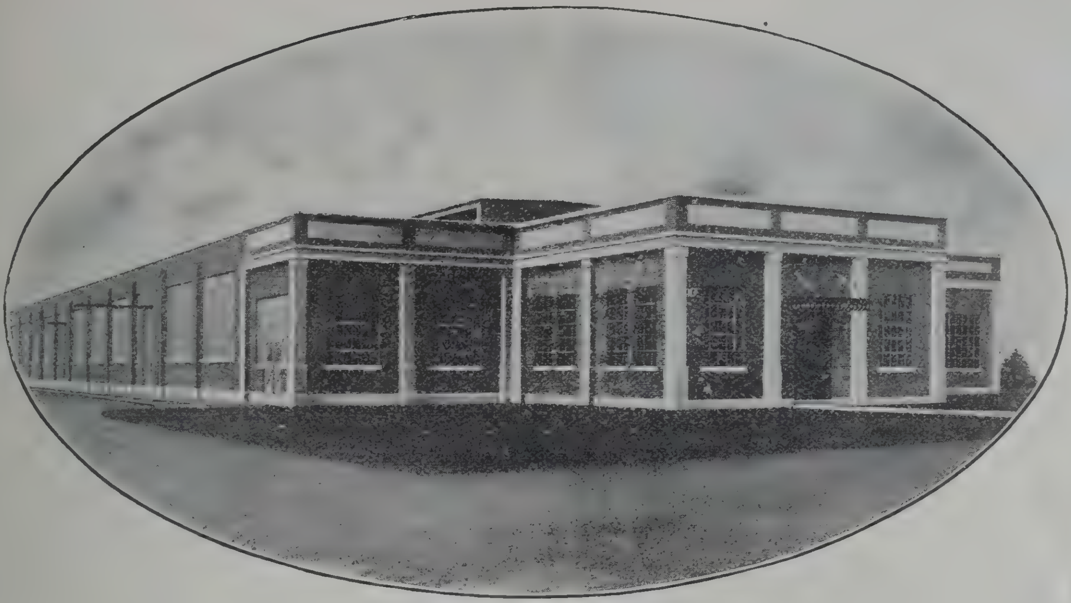
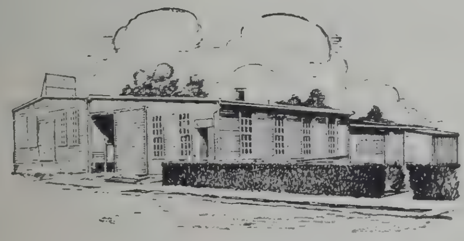
1917 1927



The Victor Cooler Door Plant—Today, 42,000 Sq. Ft. Floor Space



Victor Cooler Door Company Plant in 1917—
4,200 Sq. Ft. Floor Space

NOTHING but the superiority of a definitely better product could justify and sustain the unusual growth and development of the Victor Cooler Door Company.

From a few modest frame buildings, in 1916, this company has grown and expanded until it now requires more than ten times the amount of factory space to handle the demand for standard Victor products.

Naturally, the product itself must justify this condition and we refer, with modest pride, to the comparison of the two factory buildings—our former plant and the present one—as shown in this little folder.

Since comparison is the true unit of value, we suggest that your requirements, as they may apply to our various products, be checked by the accepted standard of Victor specifications.

A postcard will bring you complete information as to the possibilities of Ice-Conservation in your plant, by the use of Victor Standard Refrigeration Products. Address all correspondence to Hagerstown office.

Only ONE truck can do this work--

Nutting

Milk Case Truck

You can place stacks of milk cases snugly together without extra shoves. You can quickly load on a stack without first tipping it back to get the truck nose under—the Nutting has no nose.

You simply grab and go. The adjustable hook slips into the hand-hole of the bottom case. The rack helps to support and balance the load. This patented truck is giving hundreds of milk plants a quicker, easier way to move milk cases anywhere about the plant. It handles all makes and sizes of milk cases. Ask your jobber or write us for catalog C.

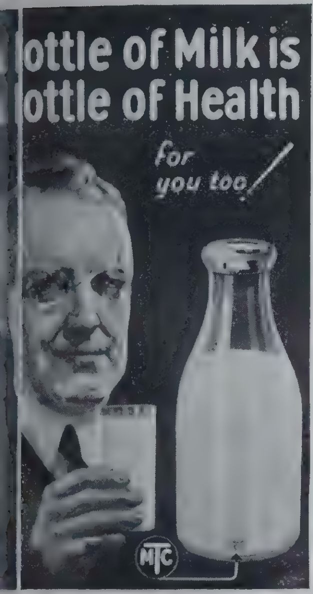
How Large Michigan Dairy Kept Milk Sales Jumping



ut this Attractive Poster on our Wagons and Windows. Get your supply now.

"WE HAVE found it profitable to use Thatcher Superior Quality Milk Bottles and to be identified with the Thatcher slogan "A Bottle of Milk Is A Bottle of Health," writes the Freeman Dairy Co., Flint, Michigan.

"We use Thatcher Posters on our two hundred wagons and trucks. These posters, plus Thatcher National advertising have done much to increase public interest in milk in this section. This interest has been reflected in our sales. In one year, our milk sales increased 10%."

You, too, can increase milk sales in this simple, easy way. And it costs you absolutely nothing. Thatcher users save money in the long run!

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher Bottles that Superior Quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trademark is blown on every Thatcher for your protection and guarantee.

Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

Will you continue to pay the toll

Excess battery weight is expensive. It acts as a direct toll charge against your profits. It is a toll that you have to pay just so long as you continue to carry the unnecessary load.

Why not free your balance sheet from this handicap and increase your profit? An Edison Battery for a two-ton truck weighs nearly *a thousand pounds less* than any other battery on the market. There's a half ton added to the pay-load capacity of every truck in your service, and the gains with lighter or heavier vehicles are proportionate.

The Edison Battery is the only one that can offer this advantage because it is the only battery of commercial importance made of steel, on an entirely different principle—*and light weight is but part of the picture.*

Longer life, greater strength, freedom from capacity losses and corrosive fumes, low maintenance and dependability have put Edisons in the battery compartments of over 61% of all battery-powered transportation equipment in the country.

The Last Word in
Direct-Expansion Coolers

U-K Direct Expansion Sections have been pioneers in the development of this phase of milk cooling. A direct expansion section on a tubular cooler utilizes ammonia gas direct from the refrigerating machine, requiring no brine, brine tank and pump, etc. If operated with reasonable attention such a section is distinctly economical.

For ice cream plants direct expansion sections are quite easy to install and prove more satisfactory, everything considered, than increased capacity in brine sections, whenever it's necessary to add cooling capacity to the present equipment.

U-K Direct Expansion Sections are made of 2 inch steel tubes WITH A NICKEL SILVER TUBE DRAWN OVER THEM. All U-K Direct Expansion Tubes are made with them. Such construction is far superior to the tinned steel tubes or tinned copper drawn over steel commonly used. Frost on the pipes is reduced to a minimum. Nickel silver will not wear off, nor rust.

These Coolers are made of the solid surface type, and the joints are all welded and are guaranteed against any leakage whatever. The ends are covered tight with a U-shaped casting of brass, as well as supporting yokes in center of Cooler.

Summing up we do not hesitate to state that this Cooler is the finest and highest grade Cooler that has ever been made — being complete in efficiency, durability (will last forever) and everything that is required to enable us to present the highest quality Cooler that has ever been offered.

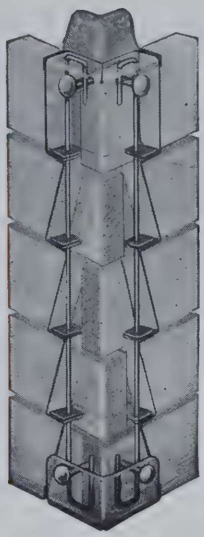
uy *for* Service



IT IS the concern that weighs results against cost that standardizes on Woolsey Bottle Crates.

They have learned through actual trial that Woolsey Bottle Crates give more service per dollar of investment.

Why?

Because there is no other crate made just like a Woolsey—nor can it be.

It is the wire laced corner that makes it so different. It is this unique construction feature that gives the Woolsey its longer life. The wire lace permits the crate to "give." It absorbs the shock. It is this flexibility that saves the bottles and the cases.

The Woolsey Butter Box

has a separate ice compartment and insulated cover. It keeps your products cold, fresh and clean. It stacks perfectly with standard crates. A convenience and necessity for every wagon.

Advertising Policy of The Milk Dealer

A Big Minneapolis Milk Dealer Tells How His Firm Uses Its Advertising Appropriation. Bases All Advertising on Sales

By L. H. HELLER*

THERE was a time, and it is within the scope of my memory so you may judge it is not so very long ago, when the statement "It pays to advertise" was open to some very serious arguments. There are still cases which you and I can name where big businesses have been built, wealth accumulated with the help of little or no advertising. Your presence at this section of the convention, however, is proof in itself that this is not the spot where the non-advertisers congregate. In any event, I am going to assume that in order that my talk be more of a treatise and less of a debate.

For the most part small dealers do not advertise. This is true to the same extent in our industry as in any other, but there eventually comes a time when hard work, aggressive methods or possibly price cutting create a sizeable amount of business for this small dealer and then his mind turns to advertising. The first thing he must do is set up an advertising appropriation. But possibly I'm going too fast. Is it necessary to have an appropriation at all? Many concerns have none and seem to flourish in direct competition to those having the most rigid policy, but the wealth of opinion seems to be in favor of the idea of a definite amount of money to be spent for advertising; with possibly a contingent fund for use in emergencies. This policy is almost universally adopted among concerns who do large amounts of local or national advertising. So let us assume that our small dealer who has just decided to do some advertising needs a fairly definite appropriation. How shall he decide what it is to be? There are four or five methods he may use.

The Task Method. In considering the task method he decides just what he wants to accomplish with his advertising. Possibly it is to get new business, or to get larger orders from present patrons, or perhaps he will attempt to introduce butter, a new buttermilk, or a special grade of cream. In any event, he decides what he will accomplish and then makes or has made a rough survey of his local conditions and decides about how much sales effort it will take to wedge his message into the milk buyers' mind. The proper mediums are then considered and their cost computed and finally a figure is reached that indicates about what the advertising needed will cost.

Another way to determine the appropriation is the **Percentage of Profit Method.** If this method is used, the gross or net profits of the preceding year are used as a basis of computation. A certain percentage of the profits are set aside for advertising. A disadvantage of this method is the inability of the dealer to advertise when his profits indicate he needs it the most.

The Percentage of Sales also form a fairly consistent method of appropriating funds for publicity. The sales in units or in dollars may form the basis. If this method is used and used consistently, it will develop a fund that increases gradually as the business is developed, but care should be exercised to compute from the nearest sales figures available.

Competitive Method. If the advertising of competitors is strong and apparently dominates a town, it is pos that none of the methods thus enumerated will fit the picture. In such a case it might be policy to t percentages out and base an appropriation on a petitive basis; that is, compute the amount of space, that must be used to create some sort of an impres Forming an appropriation in this way is, of course, ically wrong but is indulged in in a good many case because it is the only method that is practical, bu cause of the exaggerated idea of competitors' a tising a dealer obtains by listening to the advert pests that are always in one's office.

The last method I will speak of I will call, for cf a more comprehensive title, **The Insurance Me** If our small dealer cares to consider this metho will from his statement determine the physical val his plant and equipment and add to this the good value of his routes. This will give him a figure will be what his business is worth to him as a g profit-making institution. He may regard his a tising as insurance that he will hold what business good will he now has and assess the business fo protection advertising affords him.

These then are the five methods I would pick as sible ways of arriving at an appropriation. Let m peat them again.

1. Task Method.
2. Percentage of Profits Method.
3. Percentage of Sales Method.
4. Competitive Method.
5. Insurance Method.

Each method has undoubtedly some virtues, unquestionably some faults. One statement is, ever, nearly axiomatic. Any concern doing or plan to do any amount of advertising should know what going to spend and how it is going to spend.

In our company we base our advertising on because we feel that any other method would be practical. Basing an appropriation on profits in milk business is not particularly equitable since profits are often outside of the dealer's control. farmers or their agents on the market set the bu price of fluid milk while the selling price is ordin controlled by competition.) This condition does exist in most industries. We do not indulge in petitive advertising since we feel the logical wa beat our competitors is to spend less, not more than do. In our company the directors are so well sold o merit of advertising that I have not found it nece to convince them that it is business insurance. do not entirely disregard the task method. Somet we allot the advertising department additional f to be used to accomplish some definite task not seen when our appropriation was made.

So much for the appropriation. It is difficult t how much should be spent. Various amounts are sonable in different localities. We think 75/100 enough considering the margin we work on but are not unusual where 3 or 4% are spent.

When the money has finally been laid aside labeled "advertising," the question must be a

GUARANTEED PERFORMANCE

BUYING a bottle washer is like buying a car. The most important things are performance, price and the integrity of the house that builds it.

Rice and Adams offers you this Little Soaker bottle washer with the positive assurance that it is right in design and construction—that in bottle washing performance it will pass your most critical requirements—that it offers you unusual value for every dollar invested.

These things are presented as absolute facts. The washer itself, in action, will demonstrate the verity of every claim made for it.

We know these things, but to make our statements conclusive, we back them with an iron-clad guarantee. If you need a new washer, carefully investigate the Little Soaker. If you like it, buy it. Put it to work for you. Give it a month's hard service. Then, if it doesn't measure up to every claim made for it, we'll gladly take it back.

If clean bottles is what you're after this washer will give them to you—32 bottles per minute in the four wide model; 48 per minute in the six wide. Right under your eyes the transformation takes place—dirty bottles disappearing into the machine, to reappear in a few minutes—glistening and clean—properly cooled and ready for the filler. Every bottle gets a prolonged soak, 4 hydraulic solution washes thru pump, 6 pump rinses and, finally, clear water rinses outside and inside.

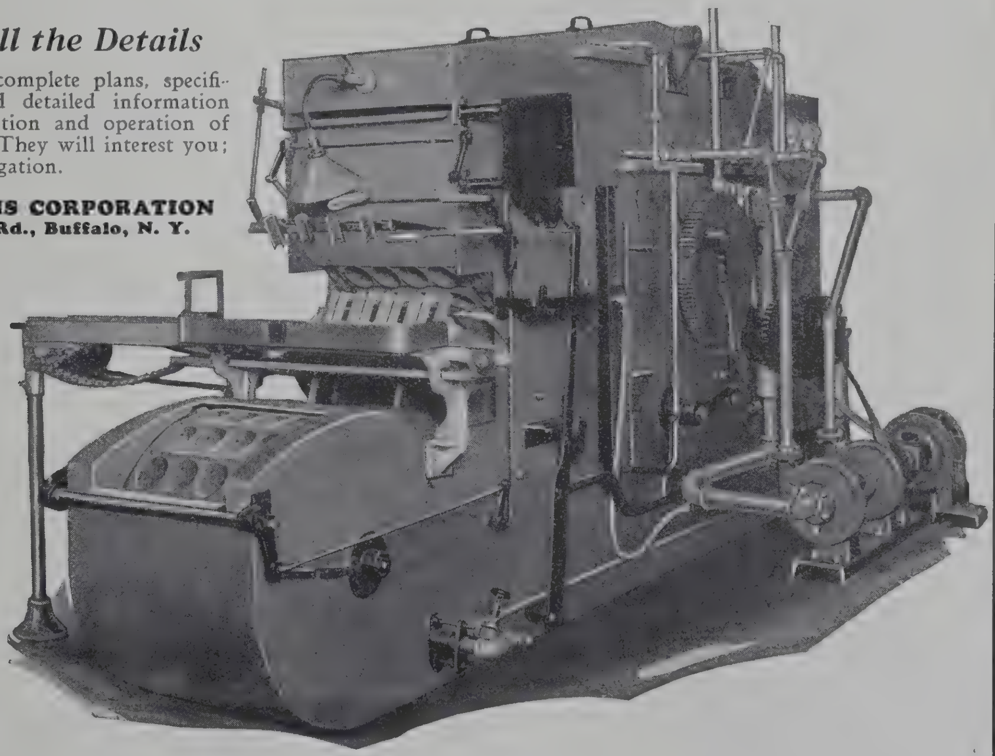
Feed and discharge at one end of machine; 4 rows of pockets always exposed for loading. Simple, trouble-free, accessible, and tremendously strong.

That, at least, presents a brief picture of the R & A Little Soaker-Hydro. Let us give you the whole story.

Send for all the Details

Let us send you complete plans, specifications, prices and detailed information about the construction and operation of the Little Soaker. They will interest you; and there's no obligation.

RICE & ADAMS CORPORATION
1148 Military Rd., Buffalo, N. Y.



OUR IRON-CLAD GUARANTEE

If after thirty days' service the purchaser of an R & A Little Soaker-Hydro is not fully satisfied with its performance, construction and value, we will take it back and refund his money.

R&A *Little* SOAKER~HYDRO

"What is advertising," and the question to be decided is what items can truthfully be called advertising, and here's where we get into deep water. Unless the guardian of the budget has a pretty definite idea of what he wants to call advertising he will find he is spending more money on the frills than he is on the backbone of his campaign. This condition is in no way improved by the bookkeepers, auditors and others who are anxious to keep donations at a minimum. As far as bookkeeping is concerned, they can call anything advertising they have in mind to but when I'm charging the advertising back against the appropriation, I want to know where I stand.

Maybe the easiest rule to follow is to say, "If in doubt, it is not advertising." I do not think solicitors' salaries, philanthropic donations, salary bonus, special discounts, etc., are advertising, but I do think there are some unusual items of expense that must be charged against the advertising appropriations since they fall into no other class. Dealers' signs, for example, may not be just your idea of forceful advertising but since their only possible value is such, they are left there. Tickets, etc., which we are occasionally forced to buy for no reason except to foster good will must be called advertising, some civic enterprises are advertising, some are not.

Occasionally the proper slant on an expenditure is negative. Not how much good it does it I play ball but how much harm will it do if I don't.

I believe it is up to every advertising manager to decide in his own mind what items are advertising and what items are not. He should be quite clear on this point in order that his advertising fund shall not become a slush fund. Don't let your own salesman or someone else talk you out of your convictions. Some things called advertising are not even propaganda.

I imagine we all have our pet advertising medium. I have, and it is entirely possible that because of this prejudice I give that medium more attention than the others and am, therefore, incompetent to do much talking. Results of any kind are usually hard to check but from my own experience I would place advertising mediums in the following order. (Entirely disregarding contests as they are a law unto themselves and will be treated separately by other speakers.) Here is the way I class them: (1) Billboards. (2) Newspapers. (3) Car Cards. (4) House-to-House. (5) Direct by Mail. My reason in placing mediums in the order just named is partly negative but I want to explain it to you.

Beginning with the medium I have named as least effective and working backwards, my objection to Direct by Mail advertising is **first** the difficulty of obtaining a reliable list of new prospects. It would seem easy with route men in all parts of the city, but we have never made it work properly and **second** the tremendous cost of obtaining business by this method. With the number of mailing pieces now being sent out in large cities, it is often conceded that unless "sale copy" can be used, it takes four letters to get optimum results. About a year ago in order to reconvince myself that direct mail was impractical in the dairy business, I tried a series of 5 letters which were prepared by an outside agency and which I must admit were good. They were sent to exactly 1,000 prospects. These 1,000 prospects were located on 8 milk routes and were obtained by sending a list of over 2,000 names onto these routes and having the routemen check off the customers we were already serving. A free bottle of milk was offered as an inducement but even with this extra bait, the results did not justify going on. To be exact it cost $3.40 to get every nibble. Even the agency admitted that it was about impossible to try and sell milk by mail.
other occasion we sent out a single letter that had

Flexibility

That's one reason why Supplee-Wills-Jones bought Cherry Coil Pasteurizers

THE time required for processing milk differs. The Supplee-Wills-Jones Company, of Atlantic City, selected 18 minutes as their time cycle — meaning that they desired each of their vats to positively hold and pasteurize *two* batches of milk in about one hour and a half. Because Cherry Pasteurizers permit an optional selection of time according to the requirements of the operator they installed four 400 gallon Cherry Coil Pasteurizers in June 1924.

Ever since their installation these Cherry Pasteurizers have been consistently and continually delivering a fine product—excellent cream line — perfect flavor — and an average bacteria count of 3,000.

5 *More Cherry Coil Pasteurizers for Denver*

The West again indicates its confidence in Cherry equipment by the recent installation of five 300 gallon Cherry Pasteurizers by the Windsor Farm Dairy of Denver, Colorado.

14 *More Cherry Coil Pasteurizers for St. Louis*

The Middle-West again shows its liking for the Cherry Principle of Pasteurization by the recent installation of four 600 gallon and two 500 gallon Cherry Pasteurizers by the Highland Farm Dairy Company and eight 600 gallon Cherry Pasteurizers by the Saint Louis Dairy—both of St. Louis, Mo.

6 *More Cherry Coil Pasteurizers for Louisville*

The South's loyalty to Cherry is again demonstrated by the recent installation of six 300 gallon Cherry Pasteurizers by D. H. Ewing's Sons Company of Louisville, Kentucky.

Flexibility is another word for adaptability. The experience of Supplee-Wills-Jones is another bit of proof of the 100 per cent efficiency with which Cherry Coil Pasteurizers adapt themselves to the special requirements of different milk plants.

◆

Nation-wide preference is accorded Cherry Coil Pasteurizers.

Here are four new installations for Denver, St. Louis and Louisville.

◆

J.G. Cherry Company, *Cedar Rapids, Ia.*

St Paul, Minn. *Tama, Iowa* *Peoria, Ill.*

When writing to J. G. CHERRY COMPANY *please mention The Milk Dealer.*

his medium would brand you as a hypocrite to former solicitors. This appeal to fairness usually works.

A policy such as I have outlined has a wonderful advantage over any other less rigid. It gets rid of people in a hurry. You do not have to ask the price, the purpose of the circulation, you simply explain you can't do it. I might say that this has been our policy for over 4 years and I do not think we have lost 5 customers through its adherence. The frequency of calls may be estimated when I say that as I write this on September 28th, there have been four solicitors in my office.

On donations we are not so straight laced. Possibly it would be better if we were. Our policy in this regard is to give merchandise (except butter and ice cream) in amounts not exceeding $1.50 to churches and charities. We have a special order book for this purpose and when a recipient calls a second time, she is informed of the last date we gave, the amount we gave and who signed the delivery slip, and if the elapsed time is less than one year, we ask to be passed up this time and allowed to give at a future date. This system works well with the usual amount of exceptions.

So much for irregular mediums and donations. Be as rigid as possible and if you are ever forced to back down, do it in a manner that will not be embarrassing at a future date.

The milk dealer's policy as respects syndicated advertising is difficult to formulate. Whether he likes it or not, if he intends to do any extensive advertising, he will be forced by stress of economic conditions to use some syndicated material. On newspaper copy he may play a lone hand and get by with probably better results than by using ready made ads, but if lithographed display pieces are needed or elaborate sales campaigns planned, the size of run needed by the average milk dealer will not permit the use of made to order material.

Syndicated material obviously fills a genuine need. Its limitations are equally obvious. It is too general. It is nearly impossible to bring it into exact accord with local conditions. In syndicated newspaper ads, another objection is important. These ads, offered to all of us, have but one purpose; to make us use more newspaper space. They are lavish, they are carelessly worked out, they sprawl their half-hearted message over twice the space needed. They are mostly designed to sell more column inches of newspaper space, not more milk.

Another important bit of advertising policy which every milk dealer should definitely decide before going ahead is the relative wisdom of advertising his own business or advertising the entire industry. My own opinion is that the International Association should institute a national campaign to advertise the industry. With this background, local advertising could be tied up with this national campaign to do unlimited good, but in the absence of such a campaign, I believe it is foolish for local dealers to attempt to exploit the industry. It is in most cases a thankless job and not a particularly fruitful one. My reasoning in this instance seems out of all logic. If advertising the industry is good policy nationally, why not locally? It is not logical, possibly it is physicological, but I always think local ads playing up any industry unsigned or nearly unsigned have a "holier-than-thou" attitude that leaves readers in no doubt as to their selfish motive; while a national campaign in national mediums seems too broad gauged to be entirely selfish. This, of course, is only my opinion on an important subject.

I prefer to let the citizens of Minneapolis get their general information about milk from their doctors, nurses and the general news columns of the daily papers. I try to make our copy specific. I assume that they know
some of the health giving properties of milk. I
convince them our milk and our service have
which are strictly our own. Possibly I convince
small proportion but I do make them realize tha
is such a product as Northland Milk and this
down some of the resistance our salesmen would
wise encounter. Let me suffix these last stateme
saying that the problem of selecting a copy po
vastly difficult in cities where raw milk is the bi
petitor. In such cities, I believe, the public sho
schooled in the safety of pasteurized milk and th
of raw milk should be at least hinted.

Well, it won't be much longer. I have taken
of your time and tried to cover the subject in son
of manner. The question of slogans and trade
are all that remain.

There are certain general requisites of a good
mark. It should be easy to say and easy to read
tional advertisers who study these things closely
to avoid coined names, foreign names, script
possible to make the trade mark suggestive in
and distinctive in appearance.

Before definitely deciding on a trade mark, th
you will put it to should be thought of. Devise
thing easy to set up in ordinary advertising an
you won't curse all the rest of your days. Rem
the branding of cases, embossing of cans, dealers
and all of the places a good trade mark is an ass
a clumsy one a bother. Because of its multitude
in modern advertising, I think a baby's head or
or a plant picture make a poorer trade mark than
tinctively artistic name plate. Beyond any doubt t
value in a trade mark. It should be used on all co
everywhere it will consistently go.

A slogan is not such an unmitigated virtue.
often slogans are hackneyed, not at all descriptive
product or its merits and about half of these we s
not slogans at all. If you need a slogan, make i
cise, descriptive, euphonious and new. To illustrate
I mean, when I say that some slogans are not slog
all, let me quote two phrases which I have culled
about 4,500 slogans already registered by "Pr
Ink." They are both intended to advertise loos
folders.

One reads:

"One of the many distinctive loose leaf book

the other,

"The binder that grows with your business

The second one may be of value if consistently
the first one is obviously worse than nothing.

One of the sub-topics assigned to me was, "H

Municipal Pasteurization Requirements

Maximum Bacterial Counts of Standard Pasteurized Milk

DATA obtained from 250 municipal ordinances relating to the pasteurization of market milk, which were reported as being in effect in 1925, were given in the January and February letters. Further data obtained from the same ordinances are contained in the following tables, which show the maximum and average maximum bacterial counts allowed for stan pasteurized market milk, both before and after pas ization, for the various population groups. Table 1 shows the highest and lowest maximum counts in of the population groups.

TABLE 1—Maximum Bacterial Counts Allowed for Standard Pasteurized Milk for the Various Population Groups (

Population Groups	Bacteria Per Cubic Centimeter Before Pasteurization Average	 Highest	 Lowest	 After Pasteurization Average	 Highest

A BOTTLE OF MILK - A BOTTLE OF HEALTH
SOUTHERN DAIRIES
MIAMI BABY PARADE MARCH 12, 1927

This float was awarded Grand Prize at the Miami, Fla., Fancy Dress Baby Parade in March. Several children were seated around the float, drinking milk, and a child was standing in the neck of a large milk bottle. Over the seat of the driver, a small child was in a swing, with the words: "A Picture of Health" over its head. It was entered by the Southern Dairies, Inc.

NEW MILK ORDINANCE FOR KANSAS CITY,

A new milk ordinance for Kansas City, Kan., cu the bacteria count for grade A raw milk from 10 per cubic centimeter to 50,000, was presented by Bassler, dairy inspector, to F. L. Cooke, park missioner and head of the health department. The posed ordinance will affect cream also, in that it mits a bacteria count of five times the total of milk. present count for cream is 500,000 bacteria per centimeter; under the new law it will be 250,000. bacteria count for grade AA raw milk remains at 1

The present ordinance virtually prohibits the sa certified milk in Kansas City, Kan., because cer milk must be produced under the direct supervisi a medical milk commission. The new ordinance vides that certified milk, if sold, must not fall belo bacteria count of AA raw milk.

State standards for butterfat, water content, were incorporated in the new ordinance. The butt requirement, 3.25 per cent, remains the same.

Michael Yundt Company,
228 Third Street,
Milwaukee, Wisconsin.

Gentlemen:-

In reply to your favor on February 3rd relative to the success we are having with the Yundt Air Brush Machines installed at our Plant, we are pleased to advise that the two machines that we are using have been in daily operation for the past two years and a half, and we have had a great deal of success with these machines in the washing of our bottles.

The expense we have had in repairs and renewals to these two machines has been very small, and we have no hesitancy in recommending your washers to anyone who is in the market for a machine that will effectably wash their milk bottles.

With best wishes, we are,

Yours very truly,

CLOVERLAND DAIRY PRODUCTS CO. Inc.
Per
Vice-President.

The Status of Tuberculin Eradication

Campaign of Education Among Producers of Milk Positively Necessary, Says Speaker at Detroit Convention of International Association of Milk Dealers.

By DR. F. D. WALMSLEY*

NO agricultural problem, possibly excepting that of co-operative marketing, has been given more space in the public press, or has occasioned more public utterances, than the subject of Bovine Tuberculosis. Like the advent of pasteurization, the tuberculin test has its champions as well as those who do not quite agree with the present day methods of eradication. The movement, however, is quite fast gaining momentum and, doubtless, before another session of this convention meets, many cities, towns and villages will have passed ordinances prohibiting the sale of any milk, pasteurized or raw, unless from herds that have been tested with tuberculin and the reactors removed.

It must be understood, however, that there is a vast difference between the tuberculin testing of herds, in order to comply with an ordinance to that effect, and the actual eradication of Tuberculosis from the herds of a given territory. In the last decade, the question of eradication has been largely confined to the sphere of economics in an effort toward conserving the herds of the nation and stamping out the disease in as orderly a way as possible, hoping that the interest of those producers could be more easily gained, the infected cattle removed, and with fewer but better herds increase the net profit per cow. In some sections of the country, this plan has met with substantial success and vast areas have been segregated, tested infected animals removed, and the percentage of disease in the herds materially lessened. In other sections, however, especially in those which were quite heavily infected, little or no response was encountered, and the plan was practically at a standstill.

During all of this period, and until quite recently, the consuming public has been educated to the point where it had implicit faith in the fundamentals of pasteurization. Evidence, in plenty, of outbreaks of contagious or infectious disease, was strongly on the side of the heating of the general milk supply to a point in excess of the thermal death point of all pathogenics, all of which tended to show that in rare cases only and those due to the human element existing, was any blame attached to pasteurized milk or the fundamentals of pasteurization attacked. So closely are the subjects of pasteurization and bovine tuberculosis associated, however, that to discuss one means virtually to discuss the other, which is exactly what is now taking place. An ordinance is proposed, hearings are held, at which the subject is placed under discussion. The consuming public is thoroughly aware of the pros and cons in the controversy, and the public opinion, stronger than any law or ordinance, is built up, which, if not in advance, quickly follows the enactment of the ordinance; the economic reasons for the tuberculin testing of dairy herds are eliminated, and the question quickly assumes a public health dimension in the sense that the consumer of milk will demand milk only from those herds that have received the tuberculin test. This condition increases tremendously the cost of the work necessary as preliminary; is demoralizing to a producing territory; destroys markets gained over a long period of years and decreases the per capita consumption of fluid milk, temporarily at least.

This word picture in fact is the difference between the tuberculin testing of cattle to meet an ordinance and save a market, and the eradication of tuberculosi orderly manner, which carries the good will of t ducer; on one hand, a slower process, but one de to effect the greatest economy possible; the quicker, but very much more expensive.

For years, in one of the heaviest producing s of the country, the program of eradication ha under way with very indifferent success. The forces had vainly endeavored to get before the Legislature a sufficiently effective measure to fa the work. Farm bureau organizations were not eff and a statute was already in force prohibiting cit villages from demanding milk from tuberculin herds only. After a very bitter series of debates, a ure was proposed providing for the tuberculin tes all herds after seventy-five per cent of the cattle given county was **tested**. While this would seem vide the necessary machinery, still there develo stronger opposition to the test than before, due thought, evidently, that there must not be forth the 75 per cent tested. At this point, the Health missioner in the State's largest city placed an o effect which demanded the tuberculin testing of a tle supplying milk to that city, and placing th limit at one year. Instead of trying to comply wi order, and in an orderly way as posssible atte least the eradicating program, an organized opp developed, which had its culmination in the issua a temporary injunction directed against the Comm er of Health and certain milk dealers, prohibiting from conspiring together in the interests of the culin test. This temporary injunction is still courts and has neither been dismissed nor made fin

At this point, the Common Council of that ci acted into an ordinance the order of the Health missioner and cut down the time limit to somethin four months. The Governor of the State then app a Commission to study this question and make a to him of what should be done. After several me of this Commission, a report was rendered which nized the tuberculin test as the best means of eradi bovine tuberculosis; advocated the immediate s by the producers of applications to have herds t recommended immediate enactment of legislation interest of more adequate funds; paid tribute fundamentals of pasteuriaztion; recommended p tion of pasteurization of all milk supplies, exc certified, and provided for the study of various me vaccination against reinfection (Calmette).

A heavy response in the way of applications signed follows, but funds and available men we forthcoming, and the Ordinance went into effect less than 50 per cent of the producers in the ter formerly supplying milk having had the test. existed. Markets went glimmering and the pro for early recovery were not promising. There w shortage of available milk, however, to meet the de due to the close proximity of a vast supply of milk adjoining state, where the slower process of eradi had been steadily going on for years.

It is undoubtedly true that the eradicating pro both by Federal and State plans, has reached a where milk distributors generally must face the

Friendly Talks on the Important Subject of Sterilization

Conducted by
J. W. YATES
formerly Dairy & Food Commissioner, Health Dept., Kansas City, Mo.

Talk No. 7

Doing Away with "Ropy" Milk

Ropy milk can be easily and effectively eliminated by the use of B-K. The simplest method to control this condition lies in disinfection.

By spraying B-K solutions upon the walls, floors and the equipment, you can destroy all forms of ropy milk organisms.

If the source is thought to be from the producers, take a small sample from each farmer's milk in a sterile bottle and permit it to stand at room temperature, or as near 60 degrees F. as possible, for 36 hours. If the ropy organism is present it will develop.

If the source of infection proves to be from the farm, insist upon the thorough disinfection of all of the utensils, both inside and out, with a solution of B-K, and disinfect the cow's flanks and udders immediately preceding the milking time. This procedure has been successfully used in plants and on farms that were confronted with serious ropy milk problems.

Write me:

If the above does not cover your ropy milk situation, write to us about it in detail, and we will supply you with information that will remedy this condition.

J. W. Yates.

Consultant in Sanitation.

GENERAL LABORATORIES
Dept. 13E MADISON, WIS.

B-K
Bacili-Kil

lem as a reality. For two reasons is this cours
visable.

It tends to increase the producer's interest in t
operative plan of Federal and State in the eradic
program.

It also tends to reduce the cost to the producer.
may argue that it costs no more to test one time
another, but where practically all of the testing has
left until an ordinance demanding action has
passed, markets are in a dangerous position; me
not available to do the work; replacements may be
which immediately places a large replacement d
due to increased cost of stock.

The entire fabric of the wonderful work that has
the result of years of study of the fundamentals o
teurization hangs by a slender thread, unless the
for the eradication of bovine tuberculosis go ste
forward. Just the tuberculin testing of cattle doe
necessarily mean that the problem is solved, becaus
less the cattle owner has been properly sold on the
ticability of an eradicating program for the good
own, as well as his neighbor's herd, for the value i
lars and cents that he will enjoy in succeeding yea
a result of his foresightedness, the plan will not su
as it should. If the eradication of the disease is to
the wholesome value to the producing element th
should, the testing work should in the majority of
be accomplished in advance of any city ordinanc
that an orderly program may be carried out.

Any plan that the distributor decided on must n
ally be changed to meet the conditions existing i
Section, based generally on a probable percentage
actions to the test.

A survey completed by the U. S. Department of
culture in July says that the disease has been red
since 1922 from 4 to 2.8 per cent. This figure, i
probability takes into account all animals, but the
centage in dairy animals would probably run some h
in both cases. In territories where the percentage of
tion is lowest, the eradicating program is meeting
the greatest success, and the milk distributor, wo
with the Federal and State authorities, can accompl
great deal. There are some sections, however, in w
the percentage of reaction is quite high, where a diff
form of plan will have to be worked out, so that
producer will actually assist in the work. It may
the form of a premium, if this can be carried out i
vance of some city ordinance. In special cases, it
been found advantageous to dispose of the entire
for slaughter, thoroughly disinfect the premises an
place with cattle purchased from an area known to
a very small percentage of reactors. This plan w
be advised in special cases where high reaction was
pected and a long, tedious task of eradication in fo
ing some other plan.

There is positively only one way in which the era
tion of tuberculosis can be satisfactorily carried out,
that is through a thorough campaign of education an
the men producing the milk.

Insuring The Purity of The Milk Suppl

Pathogenic Types of Bacteria and Their Relation to the Market Milk Supply. Destruction of these Bacteria Dependent on Efficiency of Plant Operators

By WM. H. E. REID*

MARKET milk is a term applied to milk consumed in its fluid state, and the production and handling of it requires the highest type of scientific skill. Market milk must be produced economically and marketed expeditiously; from cow to consumer it must be carefully guarded by sanitary measures, on account of its susceptibility to infection.

Aside from the useful bacteria in milk there are present many harmful types. For a great many years it has been recognized that there is a close association between unclean, carelessly handled milk and human health. This fact has been substantiated by data presented by dairy bacteriologists. Modern research has shown that specific bacteria cause specific diseases; and, furthermore, we know that these disease-producing bacteria may be carried in milk. Fortunately, milk borne epidemics are relatively few; but those that occur cause needless suffering and in some instances death, and every effort must be made to prevent them.

The main diseases borne by milk are typhoid fever caused by B. Typhosus, scarlet fever, septic sore throat caused by Streptococcus hemolyticus, diphtheria caused by diphtheria bacillus and diarrhea caused by dysentery bacillus.

Typhoid bacilli causing typhoid fever are short, plump rods and are longer than most other types of bacilli. They are motile, and develop best at thirty-seven degrees to forty degrees centigrade. On drying most typhoid bacilli will die within a few hours, although a few of the more resistant organisms may live for several weeks or even a month. Being non spore bearing they are easily killed by heat or cold and will not live above sixty degrees centigrade. Typhoid bacillus does not cause coagulation of milk but does produce a little acid from lactose. Typhoid bacillus are frequently discharged from the body in the secretion. Twenty-five to fifty per cent of patients show typhoid bacillus in the urine when with the disease. In the case of pneumonia with typhoid fever, typhoid bacillus are present in the sputum and are eliminated in great numbers. In all cases they are eliminated through the feces, even in some cases during the incubation state. Accumulated evidence shows that two or three per cent of convalescents become chronic carriers, some for the remainder of their lives. In some instances people have been known to be a carrier who have never had typhoid fever.

Scarlet fever is a highly infectious disease, characterized by a diffuse, punctuate, skin eruption accompanied by catarrhal, croupous or grangrenous inflammation of the upper respiratory system. In connection with the conveyance by means of milk, the danger comes from throat, ear and nose discharges. Most cases have been traced back to some milker who is convalescent.

Diphtheria bacilli causing diphtheria are small rods. They do not develop spores and grow best at thirty-seven degrees centigrade.

Toxic bacilli may be found in healthy throats. In fact, they have been known to be present in the throats of patients who have recovered from the disease. safe to say that in ten per cent of the cases a few exist for two weeks and one per cent survived weeks.

Diphtheria bacilli can be killed by heating to degrees centigrade for ten minutes, can be dest easily by use of disinfectants, cannot be destroy freezing, will live in damp, dark places and die exposed to dry and light places. The usual sour the bacilli are the discharges of diphtheria patie

Streptococci found in milk cause an infection throat known as septic sore throat. They are fou the udder of the cow and may be transmitted direct means of the milk. It appears some times as a s epidemic and in most cases can be traced back t milk supply, to a human or the cow's udder.

Dysentery bacilli causing diarrhea are found o the intestines. The feces are therefore the only tions containing them. They die in excretions or in one to two days and in water after a week. Th fected person is mainly responsible for the commu tion of the disease. The infection may be direct direct. Outbreaks of this disease occur more oft the summer, as the milk usually has a higher bac content. The disease is especially dangerous a children.

Milk is infected through three principal cha namely: direct bovine infection, direct or semi- human infection and indirect infection. Certain tococcic infection of cows' udders cause diseases lik tic sore throat. In this case the disease is transm directly from the cow to the man.

Direct human infection of the milk supply is established. Milkers or milk handlers suffering mild cases of infectious diseases are the chief Bacteria or infectious material can be introduced the milk from dairy hands either during milking or dling milk utensils. This is particularly true in the of typhoid fever. People who have apparently ered from this disease may harbor bacteria in bodies for years. These bacteria are excreted in the and feces and contaminate the hand of the milker

Indirect human infection may come through pe who have been in contact with an infectious diseas who are allowed to handle milk afterwards. Oth direct means of infection are water supplies and and from water by washing milk utensils in con nated water. Water supplies may be contaminat surface drainage, privys, barn yards, hog pens, Many cases of typhoid fever have been traced t luted water. Flies may carry infectious material unscreened privys to the stable or milk house and taminate the milk in this way.

In relation to the indirect sources of milk inf Carl L. Fellers and Roy S. Dearstyne have writt article in the Journal of Dairy Science, entitled, Relation of Water to Milk Borne Typhoid." Out hundred and thirty-eight cases of typhoid fever in gated one hundred and eleven, or seventeen per were caused from milk. One hundred and seventy

Just as clean as it looks

—this efficient installation of Jensen Pure Nickel Equipment

IF you could see these Nickel machines—where they are and how they look—their quality would be established without further discussion. They are used in manufacturing culture milk in a dairy whose name is nationally known—where sanitation and cleanliness are the primary essentials.

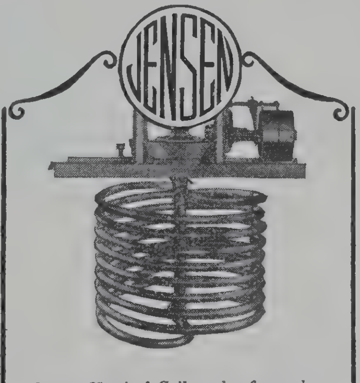
Jensen Pure Nickel equipment was ordered for this installation because:

1. It protects the culture milk from contamination—
2. It lowers bacteria counts—
3. It is easy to clean and keep clean—
4. It has no coating to wear off—
5. It lasts longer in hard service.

The trend in dairy equipment is toward Pure Nickel. This trend is indicated by the increased use of this attractive silvery metal for vats, coils, pasteurizers, cooling equipment, etc. It is also evidenced by the adoption of Pure Nickel by the world's leading manufacturers of dairy equipment.

To be safe—be sure that your new equipment is made of INCO Pure Nickel.

If you require further information, ask your regular manufacturer, or write direct to us.



Jensen Vertical Coil made of seamless Nickel tubing with Pure Nickel headers and Nickel shaft, of the type used in the two 750 gallon Pure Nickel machines illustrated at top of page. Mfd. by the JENSEN CREAMERY MACHINERY CO. of Bloomfield, N. J. and Oakland, Cal.

cases investigated were due to milk, and one hundred and thirteen of these were traceable back to the farm. Four cases were due to infected milk bottles, two to infected milk utensils. They found that typhoid bacilli will live in water for several days and that these organisms retained their vitality in surface, mineral and salt water for at least several days. The danger of a polluted dairy farm water supply is indeed a real one.

Raw milk is more dangerous, but pasteurized milk has also been the source of outbreaks due to infection after pasteurization as pathogens grow in pasteurized milk as well. Pasteurization has been a great factor in reducing communicable disease spread by milk. This is especially true in the case of typhoid, scarlet fever, septic sore throat and diphtheria. Outbreaks in many cases have caused the installation of pasteurizers.

Milk as a source of diphtheria is negligible. Milk borne scarlet fever cases furnish a small percentage. Milk borne typhoid is very serious. Four hundred and ninety-six, or seven and seven-tenths per cent, out of six thousand three hundred and thirty-one cases reported, were due to this cause. Pasteurization ought to greatly decrease the per cent of frequency of milk borne cases.

An investigation of an outbreak of streptococcal sore throats in one of our largest cities was found to be due to the milk supply. The epidemic involved several thousand cases. A number of deaths occurred. The epidemic was worse in some parts of the city than in others. The source of infection was traced to a pasteurizing plant. Several outbreaks occurred. It was found that a few days before each outbreak that there were defects in the pasteurization.

There are many other epidemics and diseases thought to be caused from milk, but there is not sufficient evidence to always substantiate that statement. The fact that milk is certified does not mean that it is pure. Even certified milk may be the means of an outbreak, particularly of the streptococcal form. Even pasteurized milk may be the cause of some outbreak, because of defects in pasteurization or contamination of handling after the pasteurization process. Thus a cough over a pail, a finger inside the can as it is lifted may be the cause of contamination.

In the plan to safeguard our population against the diseases borne by milk, the first thing to be considered is veterinary inspection of cows producing milk to be used for human consumption. It is known that a disease can be caused by the cow. Such diseases are due to udder contamination and are known as bovine diseases.

Unsanitary conditions around the barn, of the milkers, dust particles in the air, dirty utensils, or unsanitary water in which the utensils are washed may bring about infectious diseases.

Cooling is a most important factor in the production of high grade milk. Bacteria will thrive and grow in warm milk more readily than they will in milk that has been cooled. All milk as soon as drawn from the cow should be cooled to a temperature of at least fifty degrees Fahrenheit and maintained at that temperature until consumed.

Aside from all these precautions to be followed in the production and handling of milk, pasteurization is the safest method to be practiced in obtaining a wholesome milk for human consumption. Pathogenic bacteria are destroyed when milk is heated to a temperature of one hundred and forty-five degrees Fahrenheit and held at that temperature for thirty minutes and cooled to fifty degrees Fahrenheit immediately. Careful pasteurization will practically eliminate the dangers of infection from milk. The inspection of the dairy establishments should be enforced to see that all milk is properly past
So far as records have shown there has been
break from properly pasteurized milk.

In conclusion, we find from a record of outbre
pathogenic bacteria actually occur in milk eithe
raw or pasteurized state. Although it is difficult
down every epidemic, it has been found that th

WILLIAM HORLICK HONORED BY KING HA OF NORWAY.

Malted milk, the food product now known
the world, was discovered by William Horlick at
Wis. This was the first time in history that whol
milk was reduced to powder form, together w
nutritive extracts of malted cereals, so that it wa
ily transportable and would keep in any clima
named the product, "malted milk."

Years later, in 1895, Mr. Horlick combined
milk with chocolate, cocoa and other flavorings, m
in tablet and other forms.

The discovery of Horlick's malted milk has b
means of saving thousands upon thousands of live
cially of infants, and invalids requiring a highly
tious and easily digested food, many of them in
regions. It has been carried by explorers ever
and by Amundsen and Peary to the North and
Poles.

In recognition of services rendered to polar e
tion, the rank of Knighthood in the Royal Nor
Order of St. Olaf was conferred upon Mr. Hor
King Haakon of Norway.

⁂

YOUNG DAIRY SOON TO HAVE NEW HO

The Young Dairy Company, at present loc
711½ Pierce St., Sioux City, Ia., will soon move
new home, a two-story brick structure, which is
at West Fifty and Perry Sts.

The business was established many years
Edward Young, father of George W. Young, the
proprietor. During the World War the Robert
Company bought the interests of the Young Da
November of 1925 George W. Young again bec
terested in the business and since that time the
Dairy Company has carried on both a wholes
retail business.

PAYGROUND ASSOCIATION HAD GREAT PARTY.

ditor:

ought I would drop you a couple of lines and about the great time we had down at the party by the Dairy Playgrounds Association at the ter Beach Hotel, April 21st.

w some of the members of your company down ut I didn't see you. You missed a swell party. big party was given to celebrate the fact that ociation, though only one year old, has all its ships sold. Also to celebrate the fact that this ion has one of the best North woods club grounds ind in the country.

go on telling you about the party; it started off bang, a dinner and ended with a dance and noth- fun all the way through. R. E. Little was made ster, because he can talk so fluently and he was g leader on a lot of the stunts that were pulled.

ny things happened at the party that I can only ber a few things that did happen.

old Christiansen of Chicago fixed up a wonderful but it did not go off as planned, and it was the st thing you ever saw. Here is how the stunt was ed to have been worked: Robert and Mrs. Trapp Milwaukee were at the party and Arnold fixed it he entertainment committee that they should hire ractive young lady who should act the part of Chicago sweetheart. This actress was to come bawl Bob out for not coming to see her and then Bob by the coat collar and pull him out with her.

ll, this is what happened: The entertainment com- hired the young lady all right and when she n she made a lot of noise and headed straight for d Mrs. Arnold Christiansen. She grabbed Arnold coat collar and said, "What are you doing here? didn't you keep your date with me?" Then a man came in and took them both out.

bert Stoddard of Chicago put on a good stunt by sonating Health Commissioner Bundesen. With sistance of several prominent members Stoddard, impersonation, gave Frank Kullman, Sr., a very health examination to see whether he could stand rain of a party. After considerable consultation he was permitted to stay with the party until 4:00 a. m., but must not stay any longer.

R. E. Little, whom you know is secretary of the club, started to make a wonderful speech about the club being an organization, not for commercial purposes, but for pleasure and good fellowship and not for the business one could get by being a member of the association. Just then a bell boy came rushing in with a special delivery letter which was read to the audience as follows:

April 21, 1927.

Mr. R. E. Little,
Secretary, National Playground Association,
Chicago, Ill.
Dear Mr. Little:

I am informed that you are to serve as master of ceremonies at the National Playground banquet at the Edgewater Beach Hotel, Thursday evening. There is a matter which I would like to have you bring before the club at that time. Last year I bought a membership in the National Playground Association on representations of one of the members that it would bring together the leaders of the dairy industry, and that my contact with the buyers of our product and the business that I would be able to do would pay for my membership many times over.

This is to notify you that I have been a member of this club now for over a year and I have not as yet taken one darn order. What is the good, anyway, of joining a club of this kind if you can't sell something? I have followed your crowd around for the last two years and tried to be a darn good fellow. I have spent lots of money on entertainment, soda pop, and cigars and what do I get out of it? Not even the ghost of a dollar's worth of business. I go out and play golf with you and purposely play a "lousy" game so the buyers could beat me. Does it get me anything? I will tell the cockeyed world I have not got 5c to show for it. If I hope to get anything back out of what I put into this darn club I got to roll dice for it, and even at that I sometimes get cleaned out.

Then I went out to fish, thinking maybe I would get some sport that way that was worth my dues. What kind of a deal did I get there? The guide was tipped off to take me out to fishing grounds where George Wieland had been the day before and cleaned them all out. I ask you, is that fair?

I am serving notice on you right now, and if I do not write up $100,000.00 worth of business during the coming club season, you can take your darn old membership and sell it to one of my competitors and "goof" him a while. What is the use of belonging to a club anyway unless you get something out of it?

You can read this to your bunch tonight if you want to. I don't care. I'm sore.

Yours truly,
(Signed) ED. NEUMEISTER.

Well, you know Ed. Neumeister did not write that letter, as Ed. is too good a scout to say anything. He would rather throw his membership away than to let anybody know that he wasn't getting any business from it.

Anyways, who ever wrote the letter pulled a good joke and Ed. says that he'd be willing to be the goat this time.

William B. Wanzer and J. J. Jackson were captains, respectively, of the two membership teams. Because both teams won the contest that was put on, both of these gentlemen were called on the stage and, after another beautiful speech by Secretary Little, they were both graciously presented a tin hat for their work in the interests of the club.

Last, but not least, must be mentioned the marvelous musical contribution given at this party by the Ta-Shi-Ta-Wins, a secret Indian society of the club. This society is made up of all members of the Playground association who would make truly wild American Indians. I understand that the annual Spring Pow-Wow is scheduled for the week-end of June 19th, up on the club grounds. All new members of the association who are wild enough to become a member of this secret society should be prepared to take in this initiation, which is being planned.

Enclosed are some pictures taken last winter of some of the new cabins that are being put up on the club grounds and which are about ready now to take care of members and friends this season.

Yours truly,
YE SCRIBE FOR TA-SHI-TA-WINS.

⁂

THE CUB WRITES SOME EDITORIALS ALL HIS OWN.

"There are two milk dealers in a certain town that I know of," said a visitor in our office recently. "One has about the niftiest looking plant I ever saw, modern in every respect, mechanically perfect, and in every way complete—almost complete, I mean. The other man's plant is not much to look at, and I am afraid he is far behind in equipment. For the good of the industry, I wish he would straighten out things and dress up his business, but do you know—well, can you guess which one has the better business?"

"Why the —er—"

"No," said the other with a sigh, "you are going to guess wrong, I see right off the bat. The sad part of it is the fellow with the bum machinery and seedy looking appearance sells almost two-to-one against the better-equipped plant. The explanation? It's almost beyond me—just one of life's little jokes.

"For one thing neither proprietor is right in his viewpoint, but the man with the good equipment went farthest from the truth. He got too far away from fundamentals; he became so worked up over modern details, modern machinery, etc., that he soon began to believe the mechanics of the business were all that counted—believed that if he got together enough good equipment the plant would sort of take care of itself, an automatic arrangement. Well, life isn't so well ordered yet.

"So it is that the other fellow, who really is sadly lacking in appreciation of proper equipment, is emphasizing the human element. He is working. He is applying himself to his business, putting flesh and blood and human thought into his work. He knows that his fundamental job is—selling milk. So he is out selling. The other fellow takes better care of it and turns out the milk in better shape, but he is taking up so much time with his inside operations that he doesn't get to the important part of the work; there is a break in his system, break at the important end of the business.

"Of course, neither one of them will hold up long at this rate. Somebody else some day will step in and do what each of these men is doing. That is, he will have a good plant and a good sales organization, too. It's dern funny, though, why either one of these men won't take a tumble to himself and profit from the other's lesson. What an ideal combination they would make—one a merchandiser and the other a genius at plant routine. It all just goes to show, though, that whatever we do, how much money we may spend on good equipment, the milk business is a human proposition and we never, never can get far away from the fundamentals—selling milk."

That's a pretty good editorial as it stands, without further comment. There are two kinds of people who won't like it very well, possibly — the two types mentioned here. They are not confined to any particular town, however.

We like our slogans in the milk industry. Pro
no other commercial product ever had so many s
as milk, bringing out various thoughts of why m
the perfect food.

We know many milk dealers who have sloga
their own, not just business slogans, but personal sl
like "Do It Now," "Pulling Horses Don't Kick,"

"What," asked a milk dealer of us recently, "
you recommend to me for a business slogan—I me
an inside slogan—one personally to apply to me a
organization?"

"Don't kid yourself," we replied, and it was
time before he took in the meaning, and still lat
fore he ever absorbed it to any appreciable extent-
even some time after that, perhaps, before he very
appreciated the meaning—if ever.

Those three words, however, we firmly believ
good mottoes for every business to follow, whether
milk business or not. They are good for all of us
beings, for that matter. We are all given, more o
to that low, common form of deception—self-deceit
get certain ideas about our business, our organiz
and we think of apt terms to describe the superio
our business and its service over all others. In ti
begin to believe much of these fanciful things a
come firmly convinced that our one particular lit
stitution is about the only one in the world that i
ducted in just the proper way, faultless and flawl

The successfnl businessman—permanently succ
that is—is the one who keeps an open mind towa
business all the time, the same open mind that he sh
any business proposition, to any scheme that a ma
launch calling for some of his money for investme
is strange how many of us can calmly and coolly
a business proposal on its merits and quietly tel
our best friends why they are wrong, why their pr
tion won't go. Then, although we can weigh othe
ters rationally, we are absolutely incapable of acc
unbiased thought on our own business affairs.

Perhaps we in the milk business have kidde
selves more than any other class of men. Perhap
because it is such an exacting business, demand
much of ourselves, keeping us ever with it, so clos
in fact, that we can't see it in the right perspecti

It would do 90 per cent of our milk dealers a
deal of good to get up from their desks three o
times a day, walk off two or three blocks and then
around their plant three or four times. The chanc
that, in so doing, they would begin to get new
points that have been escaping them for many yea
then they might be able to **see the plant where the
been prisoners all these years!** Prisoners who hav
kidding themselves!

INSTALLS RADIO IN BARN TO KEEP CO CONTENTED.

One of the chief duties of a dairyman now-a-d
to make his cows contented with life, to ensure a
ful supply of milk, according to J. G. Sterchi, of
ville, Tenn.

Mr. Sterchi installed a gramaphone in the barn
time ago, but feeling that the cows would beco
contented if not given the latest inventions, he
cently installed wireless.

Mr. Sterchi is continually studying the whims
herd and has discovered that dance music from
clubs appears to be the most enjoyed by the cow
songs such as "My Old Kentucky Home" and
Rosary" seem to soothe the animals.

PACIFIC COAST COMPANY REPORTS GOOD YEAR.

ection of a prosperous year for the dairy indus- lifornia during 1927, together with a report of l operations for the past year, marked the re- . E. W. Pioda, chairman of the board of direc- e Golden State Milk Products Company, at the eeting of stockholders and election of officers. ing was held at headquarters of the company, ery Street, San Francisco, Cal.

-ection of all officers and the appearance of the S. Waldo Coleman as the new member of the directors marked the election.

Prosperous Year Predicted.

esenting the annual statement, Mr. Pioda sur- te dairy industry of California for the past year; ss of the Golden Gate company in broadening ets through its international sales organization, eased production that has come through the of one new plant, purchase of two others and to several other of the many plants owned and by the Golden State company in California. ise predicted an unusually successful year for ymen of the state in view of the growing de- all kinds of dairy products and improvements iry population of the state, with its attendant in production of raw product.

fficers re-elected are as follows: L. E. W. Pioda, n of the board; C. E. Gray, president; B. G. Tog- e-president; Thomas E. Day, general manager; eefer, secretary. Directors: L. E. W. Pioda, C. Moore, G. A. Berton, M. A. Gale, John Freu- . Buck, S. Waldo Coleman, B. G. Tognazzi, C. R. N. Oschwind and Gavin McNab.

financial statement of the Golden State Milk Company, as announced by Mr. Pioda, showed assets of $1,658,238.29 and current liabilities of 63.79.

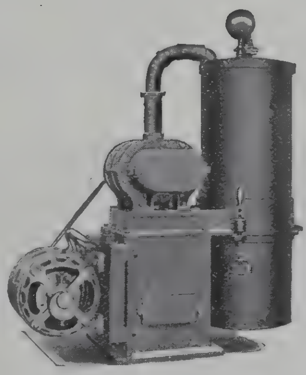
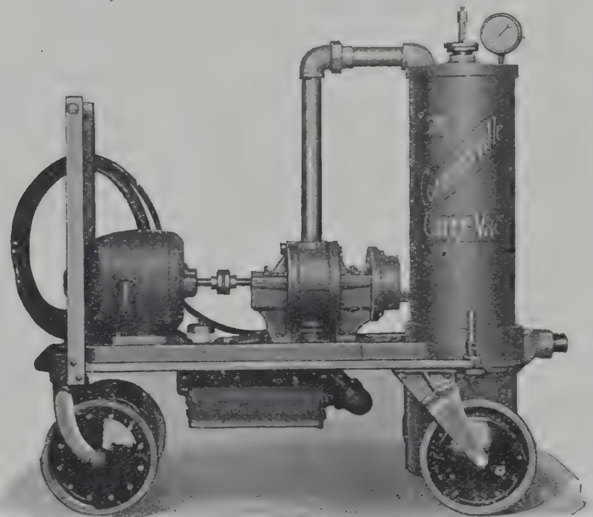
Both
Horses *and* Cows
are better cleaned with
Curry-Vacs



Vacuum currying is economical, sanitary and efficient. Connersville Curry-Vacs are the "last word" in currying equipment. They reduce bacteria count, increase milk production, and keep the cows more healthy. They keep horses cleaner, and enable them to do more work on less food.

Stablemen are in love with the machine, it reduces cleaning time, makes the work easier, and eliminates the dust flying in the air. Curry-Vacs are here illustrated in two types, truck and stationary.



Please send information on ( ) Truck ( ) Staticnary Type Curry-Vac for cleaning ( ) Horses ( ) Cows.

Dairy Pilgrimage Well Attended

Twentieth Century Dairy Pilgrims Not Interested in Rocky Soil and Pass Plymouth Rock for Nation's Capital

By a Correspondent too Timid to Speak for Himself

BY JIMMINY, if anybody thinks that the hardest day's work in the world is a farm hand's work on a dairy farm, he has another bunch of thinking coming. He just wants to visit the first day of a Dairy Pilgrimage once, and then he will find out what a real day's work is.

I thought I was going to write a funny story all about this Dairy Pilgrimage thing, but By Jimminy I am too tired.

Just like the first hundred years, the first day was the worst. The bunch came in in all kinds of ways and times, but they all got off to a bum start by the big buses being late, but once started, the party which set out as if they were a bunch of sight-seers in a couple of rubber-neck wagons, soon found out that it was worse than a day in the old country school, with a big raw boned school teacher just humping them from one subject into another one. And that is what the Dairy Pilgrimage was like.

American Dairy Federation 1927 Pilgrimage to Washington, D. C. April 26, 1927.

However, I had better tell this story straight through from the beginning. There was so much of it, that if I don't get it off my mind pretty fast, and in pretty near straight order, I will forget more than half of it. I never knew these government folks were poking into so many things as they told us about in the last three days. And say, they were not just skimming over the surface either but most of them were getting right down to brass tacks, and knew all they were talking about.

First thing was that Assistant Secretary of Agriculture Rennick W. Dunlap. He must have been the last of a big family to have drawn that first name after all the good ones were used up, but he sure knew his sprouted oats. He was put in as pinch hitter — you know what I mean—when the Secretary of Agriculture didn't get back from some important trip down in Virginia. He made us all feel welcome for Dunlap was, is, and expects to continue to be a real dirt farmer and dairyman down in Pickaway, Pickaway county, Ohio. Then he was dairy commissioner out there for four years, so he knew both ends of the business, making good butter and making buttermakers be good.

Then after Secretary Loomis lost about ten pounds of his surplus weight running around in circles trying to find out why his buses didn't show up on ti all started out for the Beltsville Experiment Stati bus tried to make up some of its lost time by three lumber wagons all at once on a narrow ro dropped two wheels into a ditch full of Marylar and water. Three ladies screamed, but the rest crowd remained cool and they all climbed out and the rest of the way—not very far. The prog Beltsville was well started when this crowd—you writing informant being one—arrived.

Learning Their Oats.

Doctor Meigs, the man who invented sprout had charge of one-half of the program, and Mr. who knows the first names of all of the ances more cows than any other man in the United S unless it is Charley Hill of the Guernsey clan charge of the other. For the rest of the day the was pumped full of information about breedi feeding dairy cows, all illustrated with the howl amples—especially some of the bulls that were and howled dolefully when they saw who all wa I have not had enough experience as a "shorthor none at all as a full fledged junior, sophomore or to tell you all about what these fellers were about, but I am told that in a few days, the Ar Dairy Federation is going to get out a printed of everything that was said. Maybe they will se one, if you ask for it.

One thing they said was that the feeding of sp oats had been tested out with fine results. Dr. told just how they knew this, all about what the scope showed. Dr. Meigs told of the increased ness of the older bulls with this feeding, and of creased age which the cows could attain and ke ducing good calves. The result of exercise on t sire was also shown very definitely. More ab need of adequate minerals in the diet and espec the necessity for careful selection of the source which such minerals could be secured. Feedir erals directly did not seem to be of so much value there was a lot of work having to do with new minations of the amount of protein in the ration is needed. Some very interesting charts show high protein feeding really makes itself felt in t pail seemed to raise some questions about other recently reported about the lack of necessity protein rations.

Over in the section which was studying br one real point was shown up by a chap who was on the comparative merit of high producing sires high producing dams. His figures on what sires—proven sires—had done toward increasir yield ought to give a boost to the price of som I know of.

Getting Them Young.

One new idea got out around. It was that mil could be brought to maximum production much than is now the practice, if some different early practices are put into effect. It was shown tha the young animal was violently separated from her milk diet, it hurt his growth curve just as b

[The use of gelatine in buttermilk will build more sales for you]

Gelatine in Buttermilk

Is Approved by Dairy Industry Experts

BECAUSE:

1. It checks "wheying off"
2. Improves taste and texture
3. Retards development of acidity
4. Increases food value and digestibility
5. Is successful in both natural churn and commercial buttermilk
6. Costs less than 1 cent per gallon
7. Does not change the manufacturing process

[Directions for the use of gelatine in buttermilk,—samples, prices, etc., may be obtained by writing to any of the following—members of the Edible Gelatin Manufacturers' Research Society of America]

he writing to EDIBLE GELATIN MANUFACTURERS' RESEARCH SOCIETY OF AMERICA, INC., *please mention The Milk Dealer.*

did his or her temper. In other words it started out an entirely new and not so good growth curve. The expert who was talking about this said that it was a lot of theory yet, but he showed a surprising lot of facts to back it up. I wouldn't be surprised if they brought out some infant prodigies next year—that is if the fellers on the Pilgrimage survive so they can get back another year.

Then the boss of the farm, Mr. Woodward, told about the struggle they had gone through to finally get enough land and enough buildings together to handle the big job they have on hand. "Would you believe it," he said, "that they figured a profit on every crop they raised; the farm crops being principally corn, hay and pasturage?" In Mr. Woodward's talk there were two very interesting suggestions for the future, one was that the farm was now supporting a cow per acre, and that a lot more cows were needed—where were the additional acres to come from unless some one got busy? The other was that they were tired of apologising for a horse and mule barn that was older than the dome of the Capitol—why should Uncle Sam spend several hundred million dollars in various ways when not a dollar could be spent for a horse and mule barn. Of course Mr. Woodward as a loyal part of the government, didn't say it this plain but that is what he meant.

A Pointed Meeting.

They have discovered a new way to use baled hay out at Beltsville. Since there is no meeting room for any crowd that might be interested enough to go there, the men in charge decided to make a place, so they cleared out one end of the loft in the barn, and piled bales of hay up to make a regular Roman amphitheatre, the visitors sat around on the tiers of baled hay, and it was a lot better than standing or sitting on the level. Worked all right except where the baling wire ties had some sharp ends standing straight up. Wouldn't wonder if some of the boys pried some of these ties up a little, just to see what the result would be when some of the visitors sat down.

After this we all were taken up to the "upper barn" where the part—nearly half—of the herd which was found to be infected with contagious abortion are kept under careful attention. Dr. Buck of the Bureau of Animal Industry told us about the test which is used, which seems to be pretty sure to pick out every aborter from this cause. He said there were some other causes, however, which cause a lot of trouble. Then he told of the methods used to gradually cut down losses, keep the new calves free from the disease, and generally get the better of it. Looks like they were on the right track.

Encroaching on the Cows' Home.

They fed us between times. Great lunch. All the rolls and Swiss cheese they could pile on the tables, lots
of milk, big bowls of what they call down here "
sausage," just plain wieners (you Milwauke
ought to know); ice cream, and cake. Tables
out in the barn with the bossies all looking in
ing where they were coming in. Showed us all th
too and this man, Graves, told us all their first
and pedigrees back to the first one that came

Then they fixed up the bus they had hauled
the mud and took us back to Washington, whe
wouldn't let us go to a movie—or somewhere el
herded us down to hear a trio of speakers, an
pictures of the corn borer. You won't catch me
any green corn this summer if those fellers get u
the lake into Wisconsin. The speakers were Doc
who bosses the whole research game—seemed
all about it too, and told us every dollar spent
back a thousand plunkers. Had his figures rig
him. Next was Secretary Dunlap—just assistan
tary, you know—but he was as near to secre
we could find out that they had down here by
him, that is. The other speaker was Dr. Erne

ANNOUNCING

The new

PFAUDLER "PFEATHERWATE" Truck Tank

A light-weight construction that will stand the "gaff"!

¶ After meeting rigid road tests successfully for over a year, the Pfaudler "Pfeatherwate" Glass-Lined Truck Tank is offered to you, with a proven record of merit. This model has been in continual service for the Detroit Creamery Co. for the past year and has met actual conditions perfectly.

¶ All this has been made possible by a special fabricating process which adds great strength to light-gauge open-hearth steel. A new cradle construction also absorbs the road shocks and preserves the life of the complete unit!

¶ If road laws have barred you from effecting the economies of bulk transportation, they are no longer a consideration. The Pfeatherwate, though only half the weight of our standard model, is equally durable. Avail yourself of the most sanitary and economical transportation system now in existence!

Manufactured in four standard sizes 600, 750, 1000 and 1250 gallons. Write for Bulletin 686!

Pfaudler THE PFAUDLER CO. Pfaudler
Transportation Division ROCHESTER, N. Y.

When writing to THE PFAUDLER COMPANY *please mention The Milk Dealer.*

first man told us about how many less cows there are now, and how they kept track of them, and were going to do more in the future with a monthly report on the amount of milk produced in the country. Another man told us how they kept track of all statistics of production all over the country, and how, after securing the market and production information, they put it out in various ways, market letters and reports. Still another one makes it his business to watch all foreign markets and production and trade between the countries. Still another one told about the work of grading, and packing and preparing for market, and still another about the work they do to help dairymen to work together in co-operative associations and in other ways.

More Assistants.

For a wonder they let us off after this morning and afternoon without asking us to spend the evening with them.

Wednesday night I thought I was all in, but Thursday morning the sun was shining pretty and it was clear and cool, and I thought I could stand the last half day, so I rubbed the stiffness out of my ears, and limbered up my note book, and started in again. This time it was just the same, only different; no agricultural at all, but up with Mr. Hoover's bright young men in the department of commerce. Funny but they looked just like the other fellers that had been talking agriculture to us, and, say, if I hadn't known that we went up Pennsylvania Avenue, instead of down Fourteenth Street, I couldn't have told the difference between what they were talking to us about Thursday and Wednesday. "You must find a good market for what you have to sell, and sell it in good shape at a good price, else better not stay in the business," was the gist of what Assistant Secretary Brake told us. Secretary of Commerce Hoover had been sent down to Memphis to tell the Mississippi river where to head in—like that King Con-not or something of the kind who tried to sweep the ocean back, and we had to have another assistant secretary open up the meeting.

Then he told how the department of commerce was trying to do for all kinds of business, the kind of things individual business men could not do for themselves. One after another a number of the heads of departments came out and told what their divisions were trying to do. One was lining up foreign agents and opportunities to sell American goods; another was keeping posted on the laws, rules, and tariffs in every foreign country. Another one was working on everything you could think of that had to do with transportation and communications, even to the number of nails, and the thickness of lumber to make the best shipping crates for butter tubs. Another one—this was Dr. Montgomery, chief of the division of foodstuffs—told how his department kept a constant record of the trade between every country in the world, in every important article of food, not only about the American exports and imports, but about how food was moving all over the world between every nation. They had a big map of the world over on the side wall. When you ride in a flivver from Milwaukee to Washington, you think you are seeing some of the world, but gosh, that world map made that trip look like visiting your wife's cousin just over in the next county, and on this map there were about a thouand little yellow and red and black dots, each dot showing where the department of commerce had a man or an office getting information to help American business or actually helping American business men who might be there on their own business. Some outfit.

Then they hustled us all out and down to t
of President Coolidge. They didn't give us time
to lunch at the department of commerce, but I
could have done just as good a job at putting u
tasty snack up there as they did the other day
Department of Agriculture.

We couldn't get into the real White House,
is in the hands of about a thousand workmen,
on a new roof, and fixing up the inside so the P
will like it so well he will want to stay anoth
years. This isn't any joke. If you think it is a
Shaver, and Governor Lowden.

The President was at work, but he came out
lawn and stood up in the front row, and had his
"took" with us. Then he stepped out in fr
looked the crowd over and looked like he was
make a speech. Probably some one had told h
we had listened to three dozen speeches in the p
and a half days, and he took pity on us, for all
was, "You certainly have a fine day for your vis
I hope you are having a profitable visit in Washi
Everyone said they were, and started to clap thei

The final event was at the Chestnut Farms Da
big show plant of the biggest milk distributing c
in the city, so they told us. Mr. Henry N. Bra
pretty proud of this because he designed it, buil
is running it. He took the whole crowd up there
big busses, gave us another luncheon, and then t
party through every part of the plant. It was a
slick place, so clean that you wouldn't know i
milk shop anywhere. And, say, I saw something I
was pretty nearly extinct — a whole barn full
horses, and some of them fit for a horse show an
Mr. Brawner is too proud of his hores to let the
get the best of them, and says that he finds horse
delivery wagons still the best for a large part of
livery business. If a lot of farmers would take a
from Mr. Brawner there would be a bigger mar
some things the farmers raise—oats for instan
mcre farm fertility.

Well I didn't tell Mr. Olsen that I would thr
lecture on farm management free, along with th
rambling story of what we did and saw and t
about on a Dairy Pilgrimage, so I'll cut it off
tells me whether he wants it or not. Mr. Olsen
was here and spent the whole two and a half day
the Pilgrimage, and he ate just as many chees
wiches and drank as much buttermilk as anyb
the trip. He says he persuaded about half of t
who were here to go to Europe to the World's
Congress with him, next summer. If they all go t
it will be "some party."

* * *

KLUETER TO BE ASSISTANT COMMISSIO

Wisconsin dairymen will be glad to learn t
retiring state dairy and food commissioner, Hon.
Klueter, is to remain as assistant commissioner an
chemist.

When he was advanced from that position la
tember the question was raised whether he woul
matically resume his old position upon his retire
commissioner. One of the first official acts of C
sioner Kramer was to settle the question by takin
to see that the records were put in shape so as
move all doubt.

Mr. Klueter has also been reappointed superin
of Dairy Hall at the Wisconsin State Fair, which
other pleasing item of news.

Wants To Know Why

TRADITION
PROGRESS

"Lad—

what the dickens is the matter with hse motors in the plant?

First they say it's bearing trouble.

Then it's insulation trouble.

Now it's called overload trouble.

What's the real cause or causes?"

"All, Pop—

all you've said and more.

They're like the auto a fellow brought into the repair shop last night. He said that everything on it made a noise but the horn.

I told you those motors were made to run a yarn winder or feather pillow packer.

The motor that fainted this morning is rated 5 H. P. If it gets 5½—it heats up and blows like a fuse link.

But give a Linc Weld 5 H. P. motor a load up to 7½ H. P. and it doesn't seem to know the difference. (For the technical reasons see pages 14 and 15 of the Linc Weld book.)

The repair man tells me that the Linc Weld is like the old mountain burro—thistles are as spinach to its hard boiled tongue."

The Lincoln Electric Co., Dept. No. 25-5, Cleveland, Ohio

Mother Knows

This New Display Service *of the* Dairy Council is *Ready*

Attractive-Educational-Effective

Artists in the Educational Display Department of the National Dairy Council have just added the "finishing touches" to another unique exhibit, emphasizing the value of dairy products. Whenever doctors, dentists, school authorities, health commissioners, or other influential groups meet, the Council's outstanding message is there to inform them of the latest scientific and practical information.

Many of these effective displays are available for rental to the dairy industry, on a cost basis, for conventions, food shows, window exhibits, schools, fairs, etc. As this new department develops, more of these unusual displays will be announced. This is another striking service of *your* educational organization.

The POWER within

PERFECTION
ROTARY PUMPS

LIFTING water out of a well 25 feet deep and discharging it 120 feet, without shock or strain to the pump, is another example of the positive suction, discharge and stability of the Perfection Rotary Pump.

The teeth of the rotor in the pump work like a pair of scissors on an angle instead of head on. Smooth running helical gears prevent excessive churning and deliver a uniform flow.

The Perfection Rotary Pump is made in Iron or Bronze. Bronze Sanitary pumps nickel plated if desired. Capacities 8 to 90 gallons per minute. Mounted on base with tight or loose pulleys or with reducing gear for individual motor drive.

Write for catalog and prices.

Smoother, Creamier Buttermilk!

with ESSEX GELATINE

ESTABLISHED 1903

YOU can give your customers a smoother, creamier buttermilk and stimulate a greater demand for your product by improving it with Essex Gelatine.

¶ Essex Gelatine softens the curd and gives it a finer and smoother texture. It retards excessive acid, and prevents wheying-off. Essex Gelatine is widely used by manufacturers of highest grades of ice cream for body and smoothness; similarly, it is a wonderful improver for cultured or natural buttermilk. Very little need be used, and this small cost is quickly made up by increased sales.

Write for Sample, Instructions for Use and Prices.

NET EARNINGS OF NATIONAL DAIRY PRODUCTS CORPORATION FOR 1926 ENORMOUS.

The combined net earnings of the National Dairy Products Corporation, New York City, and subsidiaries in 1926 were $11,119,549, after all taxes and charges, including preferred dividends of subsidiaries and $8,339,886 for depreciation and repairs, available for the securities of the corporation, were deducted.

After interest on the six per cent notes and dividend requirements on the preferred stock, the balance was $9,420,451, equal to $9.01 a share earned on 1,04 outstanding shares of no par common, as compared $4,933,258, or $6.55 a share, on 752,216 shares of com outstanding at the end of 1925. The above figure clude the earnings of companies acquired during year, both in 1926 and 1925.

Thomas H. McInnerney, president, stated "We every reason to anticipate a continued growth of volume of business and of net profits during the cur year."

A WISE THOUGHT

"Keep good milk or cream clean and cold and the quality question pretty well takes care of itself."—Butter, Cheese & Egg Journal.

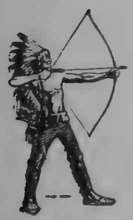
This thought tells a whole story to the creameryman, cheesemaker, or dairyman.

Yet simple as it is to keep milk or cream clean, it involves a great deal of care and time, so much so that the wise milk food producer specifies

Wyandotte
Dairyman's
Cleaner and Cleanser

for all his cleaning work because years of experience have proved its quality, dependability, uniformity, and economy.

Ask your supply man for "WYANDOTTE"



Are you using Wyandotte C. A. S. [cream acidity standardizer] for standardizing the acidity of your cream?

The J. B. Ford Company *Sole Manufacturers* Wyandotte, Mich.

LACK OF SUNLIGHT AND VITAMINE D CA RICKETS.

Rickets is a disease of the bones common amon tle-fed babies and of frequent occurrence in brea infants. The feeding of cod liver oil or exposu direct sunlight, together with a proper balance be the calcium and phosphorus in the diet, will almo ways prevent or cure the disease. If not properly t the disease will result in permanent malformation as bow legs.

Doctors are successful in the treatment of ricke as to prevention not much progress has been made W. E. Krauss, dairy biologist at the Ohio Exper Station. From recent work with rats, Dr. E. V. M lum of Johns Hopkins University, obtained results warranted the recommendation that the expecta nursing mother as well as the infant, be given su amounts of cod liver oil and exposed to direct su as much as possible.

However, cod liver oil is distasteful to many a expensive that some families cannot afford it. To ultra-violet light artificially is also expensive. sunlight, though free, is not always easily obtain children in winter.

The problem, then, as Dr. Krauss sees it, is t nish the anti-rachitic substance, or vitamine D, su chiefly by cod liver oil and sunlight or ultra-violet and to discover a source that will be within the of all.

Most natural foods are lacking in this vitamine, leafy foods as a rule being richer in this respect. contains vitamine D, the amount present being influ by the feed of the cow.

It is possible to increase the amount of vitamin milk by feeding the cows cod liver oil, or by irrad the milk. Neither is practical for the farmer.

To make milk a more potent source of vitamine practical way, cows should be given access to fresh pasture as long as possible during the pasture and in the winter months they should receive well leafy roughage, such as alfalfa hay, and be permit run out of doors daily. By increasing the consu of milk produced in this way, Dr. Krauss believes advance will be made in the prevention of rickets

GROWTH OF BUSINESS NECESSITATES IMPROVEMENTS.

Growth of business has necessitated making so provements in the factory building of the Co Creamery Company, Conneaut, O.

An ice cream hardening room, which will p space for 2,000 more gallons of ice cream, and cold room, to be used for milk only, are among t provements, the two projects to cost approximate 000. The ice cream hardening room is kept at a t ature of between zero and 10 to 15 degrees below the cold room standard temperature is 35 to 40 d

The floor space in the milk pasteurizing and b department has also been increased. A new thirty power boiler has been ordered.

NONE OTHER NEED APPLY.

Mistress: "I saw the milkman kiss you this m I'll take the milk in myself after this."

The Maid: "It won't do you any good, mu promised to kiss nobody except me."

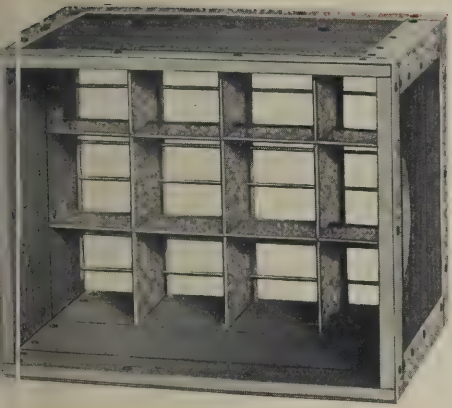
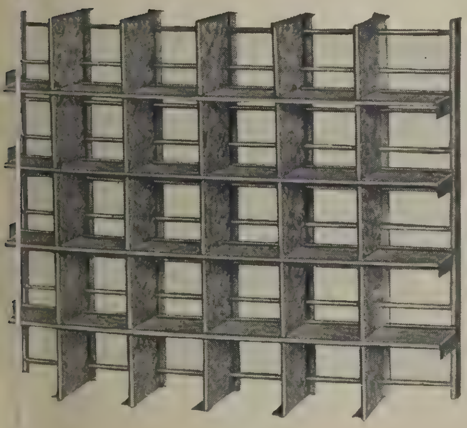
DEFIANCE

SEMI-STEEL MILK BOTTLE CASES



THIS new Defiance Case is a marvel of strength and endurance. It is practically indestructible and will easily outlast two ordinary cases.

The top and bottom of the case is heavily bound with a galvanized steel band welded into one piece. The corners are completely protected with steel angles extending from top to lower band.



The partitions are made of sheet steel, reinforced with wire beaded into each edge for extra strength; and all partitions and bottom wires are made into one unit and heavily galvanized after assembly. Sides and ends first grade, sound hardwood. No nails or screws to get loose. Case is assembled throughout with large head rivets.

The Finest Drinking Milk

comes from those dairies *that* HOOD-SEAL *the bottles*

A VERY special milk service is offered you by one or more leading dairies in your city. A service that has done more to insure you pure, clean, full-flavored milk than all other agencies combined.

You can easily identify these dairies by the Hood-Seal they use on their bottles of better drinking milk—the paper hood locked on by the wire ring.

Leading producers of better drinking milk use this wire locked Hood-Seal. Dairies like Sheffield Farms and Borden's in New York, H. P. Hood & Sons and Whiting Milk Companies in Boston, were the pioneers of this clean sealed drinking milk idea. They are the largest distributors of sealed Grade A Milk in the world. Now more than two thousand other leading dairies in leading cities all over the United States and Canada have adopted this sealed Grade A drinking milk service.

The Hood-Seal is more than a perfect, sterile seal against contamination. It is a symbol of the tremendous efforts these progressive dairies have made to insure you clean milk.

For up to the moment the Hood-Seal is fitted over the bottle, a great chain of super-sanitary measures has taken place. Each for one sole purpose. Better drinking milk.

All their work would be in vain if the milk were not delivered to you just as wholesome and clean.

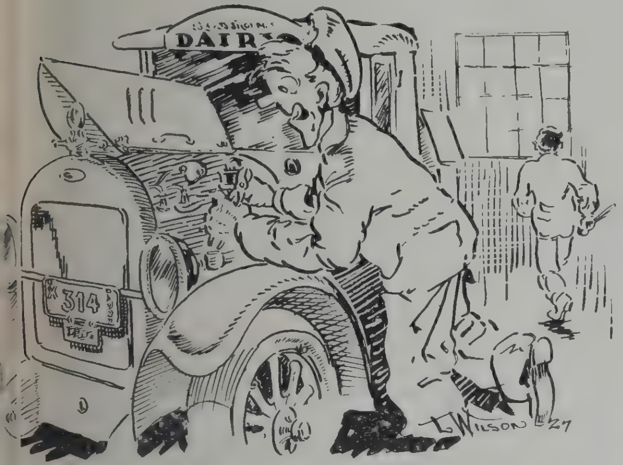
ANTICIPATING LOSSES.

I el it is my privilege and my duty to the boss to ate expenses and curtail potential loss, so with i mind my motor I have learned from A to Z, and not make a murmur that is foreign talk to me. I hear the faintest grumble or the smallest click-nd, in a jiffy I am leaping from the saddle to the , and the murmur is corrected and the clicking is cured, then I have that sweetest feeling of a d worthy steward. When my auto starts its jour- my early morning drive, every valve is working ly, every lever is alive, every tire is well inflated s proper dose of air, every bolt and bur is tight- the engine everywhere. Now, supposing in the ng when I started on my run half my tires were

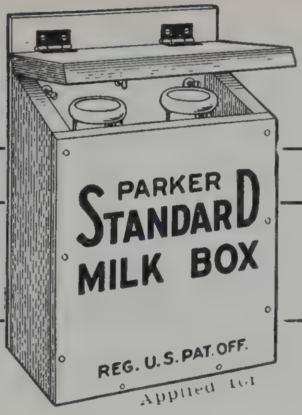


flated and one cylinder undone,—well, I might ough till dinner and I might get through till night t stopping by the wayside in a tantrum or a plight, e cost would still be piling, piling, piling for the nd his profits would be falling, there would be ex- cost; for those tires would both be wearing twice kly as they should, and there'd be excessive wear-derneath the painted hood! Time would come 'd be halted, laid up, useless half a day, while the oor helpless jigger, he's the fellow who would pay! ly have I lost a minute since I started with the r I learned at once, I'm saying, where potential s are; no, they never do develop to make free with nd gas, and they can not wear out bearings, un-ted, as they pass. Nickels saved make shining rs, quarters saved make dollar bills, and the dollar ake eagles in the boss's money tills; but the eagles be lacking, there can never be a doubt, if I didn't ff troubles just before they come about!

⁂

SENTIMENT NEEDED.

"here must be sentiment in the handling of dairy ts," Dr. W. C. Hassler, health officer of San Fran- said at a recent meeting of the California Dairy il. Dr. Hassler went on to say: "Cold finance can- the basis, nor can milk be dealt with as Rocke- dealt with oil and gasoline. The dairy industry en into the fabric of human welfare and the foun- of the industry is the consumer."



PARKER
STANDARD
MILK BOX

Will Give Triple Satisfaction—

To Your Customer

Every housewife likes to get her milk in a Parker Milk Box. She is sure that it will be there for breakfast and in perfect condition. Not frozen, not sour, not tipped over and spilled, or gone entirely; but pure, clean and sweet.

To Your Driver

This strong, well constructed Parker Milk Box will help your driver fill out his route and increase business. His daily order card is conveniently hung inside the box which enables him to deliver extras without errors.

To Yourself

The Parker Milk Box eliminates losses through broken bottles and insures the return of empties. It guarantees the delivery of your milk in perfect sanitary condition. It adds prestige and builds business through the Good-Will it creates.

FORMULAS FOR MAKING SOUR CREAM AN FORMATION ON EFFECT OF PASTEURIZATION ON BACTERIA.

Pennsylvania.

Dear Sir:—I am interested in a formula to make a good heavy sour cream. By using an 18 or 20 per cent cream by the use of the viscolizer. Also a good heavy sour cream by using 18 or 20 per cent cream without the use of the viscolizer.

Reply: I believe the following formulas will assist you in turning out a heavy sour cream. I have used them many times and obtained very satisfactory results.

Formula I.

Add two per cent of skim milk powder to 18-20 per cent cream at a temperature of 100 degrees Fahrenheit. Stir for ten minutes to prevent lumping and heat slowly to a temperature of about 120 degrees Fahrenheit, or until the powder has gone entirely into solution. Now pasteurize the cream at a temperature of 145 degrees Fahrenheit for thirty minutes. Cool to 120 degrees F. and run the cream through the viscolizer at about sixteen hundred pounds pressure. Then continue the cooling to 68 degrees Fahrenheit and add about three per cent of good culture. Hold the cream until it curdles at this temperature and then place in the ice box until it has cooled down to 50 degrees Fahrenheit. Then break up the curd.

Formula II.

To 20 per cent cream add two to three per cent skim milk powder. Heat slowly to 120 degrees Fahrenheit to dissolve the powder and follow this by pasteurizing at 145 degrees Fahrenheit for thirty minutes. Cool to 70-72 degrees Fahrenheit and add three to five per cent good starter, thoroughly broken up. Dilute twenty drops of commercial rennet extract in about one-half glass of water and add this to one hundred pounds of cream, agitating it thoroughly to distribute the rennet. The rennet helps to form a thick curd and the cream may curdle in a relatively short period. However, you should hold it over night at the ripening temperature of 70-72 degrees Fahrenheit to develop the desired acid flavor. Follow this by breaking up the curd while cooling to 40 degrees Fahrenheit and hold at this low storage temperature.

* * *

Kansas.

Dear Sir:—I am very much interested in knowing the effect that pasteurizing has on milk. I am desirous to know whether or not pasteurizing milk destroys the germs which cause tuberculosis, diphtheria, scarlet fever, and typhoid fever. Also what effect does pasteurizing have on the vitamines contained in the milk? I will be very glad for any information which you may be able to furnish me along this line

P. S.—Is the statement, "That all milk bought for resale in the state of Oklahoma must be pasteurized," true?

Reply: Pasteurization at 145 degrees F. for thirty minutes readily destroys the germs of tuberculosis, diphtheria, scarlet fever, typhoid fever, septic sore throat and other pathogenic bacteria in milk. As a matter of fact, the tuberculosis germ is killed at a temperature of 140 degrees F. maintained for even a shorter period.

The chemical changes produced by pasteurization are very slight. In fact, Rupp, in Bul. 166 B. A. I., U. S. Department of Agriculture, states that "milk past by the holder process at 145 degrees F. for thir utes does not undergo any appreciable change." work it was found that the soluble phosphates and magnesium were about the same in the serum and pasteurized milk on the same sample. Also bumin was not coagulated. Some recent work printed in a foreign publication appears to indica differences in the digestibility of ash and prote apparently not affected by pasteurization. This tend to substantiate the data obtained by Rupp t chemical changes, if any, produced in milk by past tion, are slight. Apparently it does not affect dig ity.

Work on the food value of pasteurized milk w product is fed to infants, has shown slightly vari sults under different systems. However, a very c experiment in co-operation with some twenty phy in Washington, D. C., performed on about one th babies showed the balance to be in favor of the p ized product.

Now as regards the vitamines. Vitamine A an both relatively thermostable. They may be destr oxidation but they are not injured by the tempe of pasteurization. Vitamine C is entirely or par stroyed. However, since C varies in amount in ra and may even be present in insufficient quanti can not be considered either a limitation or a dis tage of the pasteurization process.

Finally to answer your last question. The Ok State law, House bill 401, Section 10, reads as f

"All milk and cream used in the manufac creamery butter and ice cream for commercial p and all milk bought to be resold, must be pasteur a temperature of 145 degrees Fahrenheit for twe minutes, or to 150 degrees Fahrenheit and h twenty minutes, using the holding system of pa ation, etc."

Mich

Dear Sir:—We want some information relativ handling of our coffee cream.

Our cream has been separated at 40 per cent. cooled and the next morning let down to 20 p with whole milk. This cream develops a half skim milk at the bottom of the bottle.

Lately we have been standardizing with some skim milk as soon as separated and viscolizing a hundred pounds pressure, temperature about 95 We are not satisfied with the body of this, thoug is little if any serum at the bottom of the bottles. tell us the best way to put out a 20 per cent coffe with a good body that will not feather in coffee. give temperatures, pressures, etc.

What do you advise regarding whipping crea are putting out a 33 per cent cream. What will effect of viscolizing?

Reply: I believe you can overcome the separ cream from the serum of 20 per cent coffee cr using higher viscolizer pressure at a warmer t ture. I suggest the following:

Standardize the cream to 20 per cent using sk

Glascote is the Standard in the Dairy Industries

GLASCOTE

New Glascote Vat with Glass Coated Cooling Coil

STEAM goes in the jacket. Brine goes in the coil. The two never meet, and the life of the unit is indefinitely long because there is no corrosion.

The tank is completely glass lined. The coil is completely glass coated. The coil acts as the agitator, working from the bottom to the top to expel air and gases. No foam is produced.

Absolutely no exposed metal in the liquid area. Brine leakage impossible. Agitation is continuous and complete whether tank is partly or wholly filled. High glaze glass lining is smooth even over seams. Coil is sturdy and rigid and cannot chip at braces. No crevices for bacteria or mold formation.

Highly efficient heat conduction shortens time of operations. Standard Glascote cork insulation applied without pitch and sealed airtight in welded jacket. Motor driven agitator, thermometer, special outlet valve and operator's platform, complete. 350—550—750 and 1050 gallons.

Send for bulletin.

Clean Equipment Lasts Longer

It is a well known fact that things kept clean will last longer and wear better. This is especially true with all equipment in the milk business. Here, cleanliness is an absolute necessity irrespective of the cost.

And when Solvay Super Cleanser is used the cleansing is perfectly done while the cost is extremely low.

SOLVAY
SUPER CLEANSER
Trade Mark Reg. U. S. Pat. Off.

the ideal cleaner and cleanser, is produced and sold direct to the trade by the largest producer of alkali products in the United States.

You receive the benefit of the large scale operations and enjoy an exceptional product at a most reasonable cost.

Place your special cleaning problem in the hands of our Technical Service Department. Their experts will help you. No charge of course.

You can quickly demonstrate the efficiency of Super Cleanser—send today for a testing sample and a copy of the Super Cleanser booklet.

or whole milk, warm to 120 degrees F. and visc
if you pasteurize the product, cool to 120 degrees
run through the viscolizer. In either case use a
of about 1600 pounds. This pressure may be v
obtain the desired consistency in the cream.
cream as quickly as possible to 45 degrees F.

If you do not wish to viscolize, then it will b
sary to regulate the separator to separate approx
a 20 per cent cream and use as little skim milk i
ardizing as possible, even then the cream will
somewhat from the serum. When milk is once se
the component parts, skim milk and cream, can
remixed and have the same physical properties
milk before separating. This is why your prod
less viscolized as above, shows cream separating f
serum the same as in milk when it stands.

Now, as to feathering in hot coffee. Viscoli
vors feathering and the higher the pressure t
readily the cream will flake. This is therefore
reason why you should regulate the pressure to
a point as possible, that will prevent separation
cream from the serum.

A second cause of feathering in coffee is the
of adding the cream to the coffee. It has bee
that mixing cream with sugar and then pourin
coffee, usually produces flaking, probably beca
sugar takes up moisture from the cream and
precipitation of some casein which shows up a
when the coffee is added. There is much less c
flaking if the sugar is first dissolved in the co
then the cream added.

A third cause of feathering is the acidity
cream. The higher the acid, the more pronoun
flaking.

Now as regards whipping cream. There
eral important factors in securing a good whip.

First: The fat content. Cream should conta
30 to 35 per cent. Thirty-three per cent as spe
your letter is very satisfactory.

Second: Temperature. Cream should be wh
temperature as near 40 degrees F. as possible.

Third: Aging. As cream ages it gains in v
Aging 15-24 hours at 40 degrees F. should yiel
desirable viscous cream if the product has be
viously handled properly.

Fourth: Viscosity. The method of handl
milk from which the cream is obtained is very
ant. If cream is held in storage for a day or s
pasteurizing and then this if followed by anothe
of storage to age it, you will find a decided det
effect on whipping.

I suggest you pasteurize the cream right aft
rating and hold it 24 hours at 40 degrees F. to

If the above does not give you the viscos
whipping properties try the following. Paste
milk as soon as received at the plant. Hold ov
at 40 degrees F. The next morning warm to 80
or 90 degrees F., no higher, and separate. T
cedure gives the fat globules time to harden
vents their injury during separating and past
If the resulting cream is aged 24-36 hours at 40
F. a great increase in viscosity will be noted an
did whipping properties should be secured.

As to the effect of viscolizing. Cream so treat
on air rapidly, but experiments have shown it
stiffness and the yellow color of good whipped cr
stiffness is a characteristic of a good product.

In The Southern States

By Our Special Correspondent in Memphis, Tennessee

Memphis, Tenn., still has hopes of entertaining the National Dairy Show this autumn at the Tri-State Fair, that event to be deferred until October if the plans in contemplation work out and held at the same time as the National Dairy Show. C. L. Hill, president of the National Dairy Show, was in Memphis recently in conference with the Tri-State Fair people headed by O. P. Hurd, president, representatives of the chamber of commerce and other civic bodies. S. H. Anderson of Chicago, secretary, was here several days ago. He visited the fair grounds east of the city with Frank Fuller, manager of the fair, and R. E. Logsdon, manager of the convention division of the Memphis Chamber of Commerce. Stables to accommodate 1,200 head of cattle, a large live stock pavilion and covered space for the dairying and general agricultural machinery exhibits are required. The combined show and fair gauged by former attendance records fair week here and the show attendance would attract about 250,000 people. The dairy show people will expect a heavy guarantee to pay part of the expense of the show. Memphis is becoming the center of the dairying industry of the central south, which has had recent fine developments in the towns of Lewisburg, Tenn.; Starkville, Miss.; Tupelo, Miss.; Murfreesboro and Clarksville, Tenn. The result of the conference at Memphis will be made known in due course.

BUSINESS INCREASES AT DAIRY PLAN

H. Rabild, general manager of the Titusville
Products Company, Titusville, Pa., announces t
month of March was the best month since the b
was started.

"We handled over 600,000 pounds of milk and
during March," said Mr. Rabild. "This is a
amount of milk to be 'dumped' by one man,
means that with the weight of the cans, this em
of the dairy plant has lifted about 800,000 pou
thirty-one days."

"While we are finding a ready market for ou
ucts," said Mr. Rabild, "we could handle more mi
we invite farmers who have been contemplating s
their milk to our plant to start at any time, as
in shape to handle all the milk we can get. We
that the returns from milk sold to the Titusville
Products Company will equal any market to which
ers in this vicinity have access, and our prices
generally better than many of the markets avail
local farmers."

During the month of March the plant receive
and cream from 212 different farmers within a ra
fifteen miles of the city, the farmers receiving t
over $16,000.

Better Than the Law Requires

Texas Milk Firm Has Worked for High Quality During All These Years and Makes It Pay Big Dividends

By AUSTIN E. BURGES

NEARLY twenty years ago a young man, fresh from the agricultural department of the Tennessee State University, turned his eyes westward in search of a suitable place to follow his chosen occupation of milk production. He chose Dallas, then a city of 60,000 to 70,000 population, and started with twenty cows, four men, and one delivery wagon.

Lindsley Waters, president of the Tennessee Dairies, was that young man His modest enterprise has since expanded to where it is necessary for him to run 75 milk wagons to deliver his product. The drivers of these wagons deliver from 36,000 to 37,000 bottles of milk daily.

Exterior View of Tennessee Dairy's Plant at Dallas, Tex.

From the first Mr. Waters was imbued with the idea that the people of Dallas wanted and were willing to pay for a quality product. Since that time he has spared no expense or effort that was calculated to produce the highest grade of milk and to get this milk to his customers with clock-like regularity and dependability.

When he set up in business the faucet can and milk pitcher were in vogue in the Southwest He was the first in his territory to adopt the more modern idea of selling milk in bottles capped at the dairy. With the adoption of that innovation he changed his plan of delivery from two deliveries a day to one. He was also the first in Dallas to sell milk from tuberculin-tested cows and the first to install a modern refrigerating plant for cooling and caring for his product.

By 1918 the business had expanded to 700 cows, and there was a lively demand for the whole of the product from the dairy. Instead of one wagon, twelve wagons were being run. Dallas was beginning to grow in real earnest and it was decided to change from a producing dairy to a distributing plant.

With this change came a modern pasteurizing equipment which has been constantly added to to keep it abreast of the times. Upon reaching the plant the milk is discharged into a 3,000-gallon, glass lined thermos tank where it is kept at a temperature of 40 degrees to keep it sweeet and agitated lightly to discourage the tendency of the cream to rise.

Leaving the storage tank, the milk is pumped to the aerator where it pours over the outside of the pipes being warmed as it falls. At the bottom of the aerator it is caught and carried to the pasteurizer, whe
quickly heated to 142 degrees and kept that hot
minutes, which is enough time to allow a safe
over the minimum required for pasteurization.
are four pasteurizers of the vat type, each ha
capacity of 500 gallons per hour.

From the pasteurizers the milk flows back
aerator, this time inside of the pipes, giving up s
its heat to the cold, raw milk which continues
over the outside of the pipes. By this means b
refrigeration applied at the receiving stations a
heat applied at the plant in the pasteurizing vats
twice

While the milk is being pasteurized bottles ar
prepared for it by the washer. This machine,
never breaks a bottle, handles hundreds of the
tainers at one time, putting each one thro
thorough cleansing process. The bottles move
through a solution of caustic potash, fresh
being supplied all the time, until they are gli
clean. The whole cleansing process consists of
number of separate operations.

From the cleaning machine the bottles travel

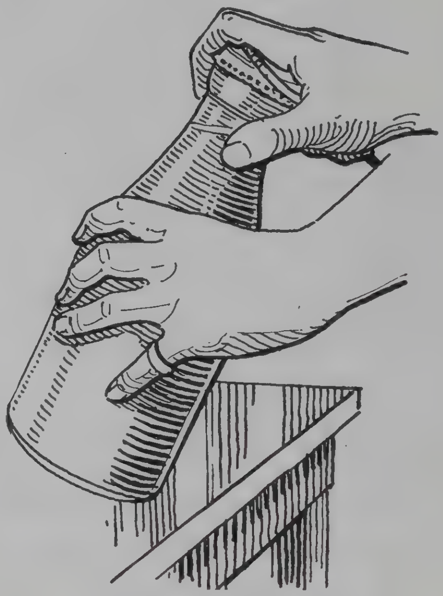
THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

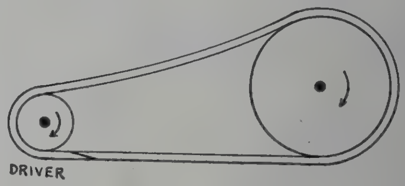
IDLERS, BELTS AND PULLEYS.

By W. F. Schaphorst, M. E., New York Cit

Not long ago I read this in a prominent engi
journal:

> ''This idler is near the driven
> pulleys, which is contrary to
> the best engineering practice.''

It is not poor engineering practice to place a
pulley near the driven pulley when the driven p
the smaller of the two. The best practice is to
place the idler
the small pull
gardless of wh
is the driven
driving pulley.



It is also stat
if a belt is run
the lap the bel
ble to go to pieces if moisture is in the room. Th
tion of the lap is dependent more upon the direc
slip than it is upon the direction of motion of t
Since slip is usually greater on the smaller pull
on the large pulley, and since slip is always
the tight side, it is evident that in a drive such as
in illustration above with the small pulley as the
pulley, the direction of the lap should be in the d
as indicated so that the joint will have as little te
to roll or peel as possible. True, when the joi
the large pulleys, the slip is in the opposite direct
there is a tendency to peel or roll, but the peelin
ency is less severe than on the smaller pulley. Th
tion of motion of the belt which was at one time re
as the criterion is therefore of less importance t
question: ''On which pulley is the belt liable
most?'' The answer is: ''Slip is always greater
small pulley.''

The same writer recommended facing pulle
leather. I would discourage the use of leather
unless absolutely necessary, because such covers
ducive of excessive wear. If a drive is prope
signed, if the belts are wide enough, and if the
are large enough, there is seldom any necess
leather or canvas covers.

Considerations in Buying Washers

Can Washer to be Efficient Must Thoroughly Wash, Sterilize and Dry Rapidly With Minimum Labor

By L. F. HATCH*

DUE primarily to the persistent campaign which has been carried on by trade papers serving the interests of creamerymen and fostered by dairy departments of state universities and state and local organizations, the practice of returning buttermilk in cream cans is being discontinued to a large extent.

The losses through moldy butter directly due to the practice of using the cream cans as a container for buttermilk had reached alarming proportions and the elimination of this custom is a great stride forward in the creamery industry.

More and more progressive creamerymen are coming to the realization that just so long as this practice continues just so long will there continue to be large quantities of sour, moldy and off-flavor cream.

Instead of sending buttermilk back to the farm in the cream cans, they are now properly cleaned and sterilized and the creameryman is either disposing of all the buttermilk to one individual, or using separate containers for the buttermilk or in some instances installing buttermilk drying machinery.

The farmer does not have adequate means for washing and sterilizing his cans nor does he in many instances realize the importance of doing so. To assure themselves that their cream will be delivered in a fit container, the creameryman must see for himself that when the can goes back to the farm it is in proper condition.

Washing cans by hand is a slow, costly, inefficient and antiquated method of doing the work. The farmers usually deliver their cream at about the same time and resent having to wait around for their cans to be washed. If cans are being washed by hand, extra labor is required for this purpose, and usually the job is only half done.

When proper modern power driven can washing machinery is installed, cans are quickly washed, sterilized and dried with a minimum of labor and much more thoroughly and efficiently than can be done by hand.

While the style of machine to be recommended in each instance depends upon the number of cans to be washed, the speed required, the method of handling and plant layout, for the medium sized creamery the rotary type can washer will usually be found most suitable.

Machines of this type can be obtained which will handle from 180 to 360 cans per hour and require but one man to operate them. Another feature favoring the rotary machine is that being more compact, it requires considerably less floor space than the straightaway type. On the other hand where large quantities of cans must be washed quickly the straightaway machine is to be recommended. In such installations, cans are usually delivered at one platform, are dumped and then washed, sterilized and dried in the can washer which at the same time delivers them to another platform where the farmer picks them up.

In considering the installation of a can washer the creameryman should ask himself these questions:

(1) What size and type machine will be best suitable for my requirements?
(2) Does the machine under consideration embody those features which are necessary to properly wash inside and outside, thoroughly sterilize and thoroughly dry cans at the speed which quired?
(3) Is the machine under consideration s structed that it will be economical to both as to labor and steam and water co tion?
(4) Is it a machine so designed that all pa easily accessible for cleaning or for adjus replacing of parts?
(5) Are the materials used in the construc such character as to insure long lif minimum upkeep expense?

The first question as to size and style (rot straightaway) machine best suited, we have alrea sidered.

With regard to the second question, in which sidered the construction of the machine from th point of efficiently washing, sterilizing and dryi cans at the speed required there are many thing said. We will mention just a few.

A machine equipped with preliminary rinse operates intermittently flushes out much of the fore the can reaches the solution wash jets and intermittent in operation but little water is used.

Wash jets should be so constructed so that th of the jet is delivered directly to the neck of the as well as to the sides and bottom. A jet of wate ing the bottom of the can only and which is supp wash the neck as the water falls back down the s the can is obviously not as efficient as the jet unde pressure which directly strikes the neck of the well as the bottom and sides.

Ample provision should also be made for wash **outside** of the can. Large jets delivering water high pump pressure are most effective for washi outside of cream cans.

After passing the washing jets, cans should b oughly rinsed and then sterilized with live steam

The machine should be equipped with a large heater so that a sufficient supply of hot air is de into the can to thoroughly dry it.

Not only must the machine be equipped to g cans the treatment outlined above but it must designed so that the speed at which the cans a cessed through is fixed and the capacity cannot be by the operator. This is accomplished by means automatic power drive which is set at the spe which the machine is designed. Where this aut drive is intermittent in its operation, the cans co stop over each washing, sterilizing and drying p and receive a more thorough treatment. With to the covers, these are more easily washed an thoroughly dried if handled on edge. In this posi water can be carried either on the inside or out the cover.

Economy of operation is also an important Machines which are equipped with pumps use this over and over again, and the only water wasted preliminary rinse water as the sterile rinse water again to freshen the wash water. Steam is use for sterilizing, blowing water off bottoms of th and for the hot air heater. These steam jets op

Cleans down to the metal
— *and stops*

THAT is exactly the way Oakite cleans! Powerfully active against dirt in any form, quick to loosen even hard, burnt-on casein, Oakite cleans right down to the metal—and stops. Oakite cannot attack or harm the surface in any way because it contains no acids, alkalies, caustics or metal-harming ingredients.

Take milk cans for instance. The exceptionally long service derived from cans and similar equipment washed with Oakite is but one of many ways in which you profit by using Oakite methods. You save time and money in all cleaning operations. You require *less* labor in cleaning—have *more* labor available for other work. And you get that *thorough* cleanliness which is a positive safeguard to purity.

A postal to us brings an Oakite service man to you with full details. No obligation.

OAKITE IS MANUFACTURED ONLY BY
OAKITE PRODUCTS, INC., 30B Thames St., NEW YORK

Industrial Cleaning Materials and Methods

intermittently reduce steam consumption to a mini The rotary machine is most economical as far as is concerned as one man loads and unloads from the position.

Another point to consider is accessibility of th chine for cleaning, adjustment or replacing of The machine should be designed so that the can or carriers can be easily removed making the ins the machine accessible for cleaning of tanks and All moving parts should be simply and strongly structed and located where they are easily acce All push valves, etc., should be on the outside of th chine where it is possible to see that they are wo properly and adjustments made if required. All ing parts should be heavy and durable.

These are just a few suggestions that it is hope be helpful.

Manufacturers of can washing machinery a course, always glad to tell you about their equip Our advice is to get all of the facts, weigh them fully, having in mind the points mentioned briefly

Modern efficient can washing machinery is ess equipment in every progressive up-to-date creamer those who are installing machines of this type ar ting big returns on their investment.

GIVING THE TIMID EMPLOYEE SELF CONFIDENCE.

Jake worked in the office. He came to us well- mended, and I didn't note anything particul specting him at first, except that he was shy. He color at the least attention from a superior. I had sion to call his attention to a trifling error, and th low turned pale. I noticed that he acted sick f rest of the day. It was plain that he was a very ser fellow; the fact was more apparent every day.

There came a spell of dull business, and there was not enough work for Jake in the office. Jake it, of course. When I sent for him, I knew he ex to be let out.

"Jake," I said, "there isn't work for you office, and we are going to give you some work o set you to work drumming up business. There is of opportunity. You'll begin tomorrow."

Jake took it hard. I thought for a second he w ing to faint—not at a job being saved him, but work he was asked to do.

"You don't mean—selling?" he whispered. course!" I said.

"I can't sell!" he wailed. "Why, I'd die first have to resign, if you mean this."

I told Jake to resign then, if outside work him. I used the word scare. I think it stung his At any rate, his head went back, and he said he try it. He was mad clear through.

Did you know that sensitive men make the best men, that timid men are good selling instrumen have demonstrated it again and again. I knew th timid Jake, with his sensitive nature, would sell house afire—if he once got past the initial fright idea.

We helped Jake over some rough spots, and he good in a wonderful way.

The best plan to put confidence into a timid if you think he really has stuff—is to throw hi the cold water. If he has the stuff, he'll come th

This Chart

Gives You Accurate Check on Temperatures

From the moment heat is applied at the start of the pasteurizing process, and up through progressive stages until the pasteurization point is reached, Bristol's Recording Thermometers patiently and accurately write the complete story of what is happening.

Plain, clean-cut record lines show each successive step and variation in temperature. At no time is it necessary to guess.

And, when the batch is run through this record is your proof that pasteurization has been carried out—*thoroughly.*

The "Bristol" is wonderfully simple in operation; in fact there's nothing to get out of order. And they are absolutely fool-proof.

Write for Bulletin No. 349.
It gives complete details.

"THE ROGERS WAY
MAKES YOUR SURPLUS MILK PAY"

Rogers SPRAY PROCESS
MILK POWDER PLANT

is the only process that—

Produces a uniformly high grade Milk Powder.

Guarantees complete recovery of solids.

Produces milk powder completely soluble even in ice water.

Gives you greater capacity at lower costs.

Guarantees uniformly low moisture content.

Eliminates all possibility of second grade powder.

That's why there is more milk powder produced by Rogers Spray Process Milk Powder Plants than by any other process.

That's why Rogers Spray Process Milk Powder is always in demand.

Rogers Vacuum Pans

Rogers Vacuum Pans are the most efficient means of removing water from milk. They double the capacity of your drying unit, besides putting you in position to take advantage of the Condensed Milk market, as well as the Milk Powder market.

Rogers Vacuum Pans, as well as Rogers Drying Equipment, can be operated efficiently on exhaust steam.

Goshen, N. Y.—W. J. Kingsland has sold to John W. Tolley of New York, vice-president of the Ward Baking Co., his 210-acre Derrydale farm, which is located two and a half miles from here.

⁂

STUDENTS BRING COWS TO COLLEGE.

According to a report issued by the Texas Technological College, Lubbock, Tex., seventeen students attending the college have brought their cows to school—not to educate the cows—but to help pay their expenses. The agricultural college has set aside a part of the dairy barn to accommodate the cows. The students sell the milk to the residents of Lubbock who are very willing to patronize the "Student Dairy."

LOUISIANA FARMERS MAY TAKE ADVA OF DAIRYING OPPORTUNITIES.

At the recent dedication of the Hope Haven trial and Mechanical School at Marrero, La., States Senator Joseph E. Ransdell made a plea to ana farmers now in distress to turn to dairying the farmers of Wisconsin, Mississippi, and other Senator Ransdell used the following story as th duction of his address:

"It is of record that once an Irishman stole and a Dutchman a cow," said the speaker. "Bo lodged in jail, in adjoining cells. Time passed and became tiresome. To break the monotony, twit the Irishman, the Dutchman said, 'Pat, vat is?' Characteristic of his nationality, Pat replie toime to milk.'

"It's time to milk in Louisiana," declared th senator.

"Wisconsin found it time. Practically every the great Central West has found it time. Wis prosperity," Mr. Ransdell said, "is largely due dairying."

"One of Wisconsin's earliest victories was a at the Cotton Centennial in New Orleans in 1884 said Senator Ransdell. "More than 50 year passed since its enterprising people decided that time to milk,' and statistics show that Wisconsin the leading dairy state of the Union."

Louisiana is generously equipped for dairyi the fine modern dairy at Hope Haven stands as e of progress that is being made in Louisiana in dustry.

⁂

WEBSTER COUNTY (KY.) SHOWS BIG GA DAIRY BUSINESS.

According to E. Prewitt, dairy specialist for th of Kentucky's College of Agriculture, Webster has made the most phenomenal gain in the dair ness in the last three years of any county in th

In 1919, Webster county produced 707,447 ga milk, and in 1924, 1,580,480 gallons. In five ye production of milk was doubled. In 1919 the cow produced 351 gallons of milk per year, and 389 gallons, an increase of 48 gallons per cow years.

In 1919 Webster county sold 1,705 pounds of fat, worth $767.25, in 1924 75,000 pounds, worth and County Agent C. O. Dickey estimates there 250,000 pounds of butterfat sold in 1927, worth $ These figures were taken from the agricultural report of the government.

GOATS BECOMING POPULAR.

Jos. A. Finney of Xenia, O., is the owner and ger of Finney Farm, that city, on which farm Mr. devotes practically his entire time in the care twenty head of Toggenberg goats.

The breeding of goats the country over for mi duction is multiplying rapidly. Goat milk for is vastly superior to cow's milk. That is beca globules of fat in the former are much smalle those in the latter. This difference results in easie tion. It takes an average of half an hour to dige milk; one and one-half hours to digest cow's milk

Goat milk has another quality that commends that is the freedom from germs. Tuberculosis goats is comparatively unknown. That is probal to the successive generations that have lived in t air of the Alpine region. All imported Swiss che richest and most palatable in the world, as well most nutritious, is made from goat milk. It is that a cheese factory will be established in Green

⁂

ENGLAND ADVOCATING DRINKING OF M

According to the statement made by Prof. V. tram, the well-known dietetic expert, speaking a pia, London consumes more milk per head th other city in England, but Londoners are still far the Americans.

Dr. Mottram went on to say as follows: "Da nations are the most progressive nations in th and there is no reason to grumble, therefore, England is becoming a great dairying country. the one food which ensures that wounds heal it effects rapid convalescence after illness, and all, it supplies those properties which create the growth of children."

EMBARGO LIFTED ON MILK FROM ONTARIO, CANADA.

According to an announcement made by the Department of Agriculture, Washington, D. C., the American embargo on shipments of milk and cream from Canadian territory within a radius of 200 miles of Montreal (Canada) has been modified so as to permit entrance of milk from the province of Ontario. The full text of the announcement follows:

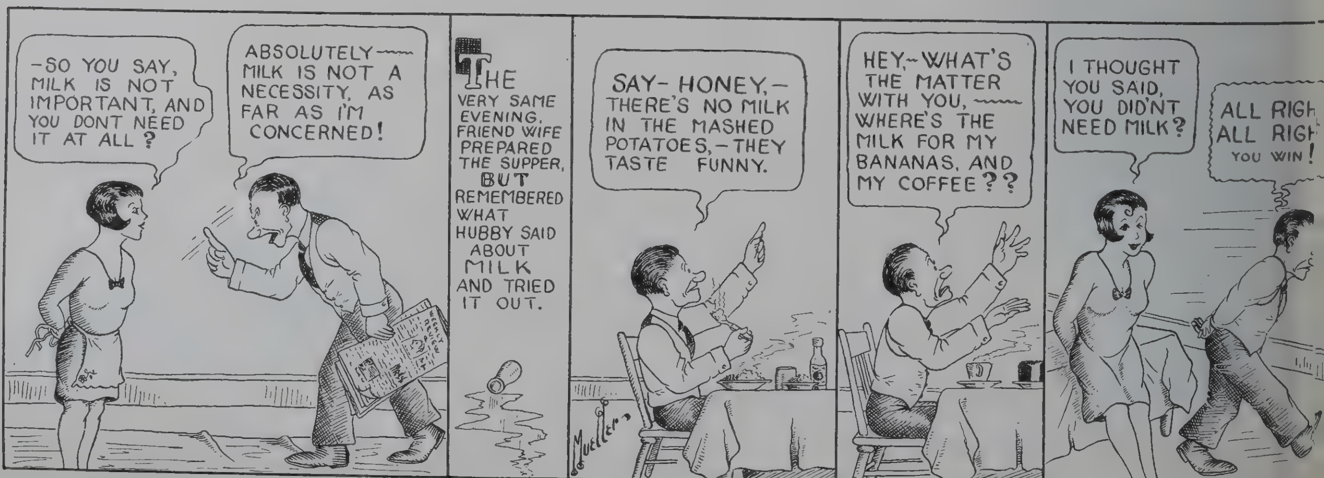
"The embargo against milk and cream from the Canadian territory within a radius of 200 miles of Montreal March 26, under the provisions of the food and drugs act, because of an epidemic of typhoid fever, was modified April 26, 1927. The change in the embargo permits milk and cream produced in this section of Ontario to be brought into this country, but the embargo remains in force on all the territory in the Province of included in the original embargo."

The modification was made by the Departm Agriculture on the recommendation of the public service, based upon information secured from i agents and the Dominion health authorities and or ances of extremely rigid sanitary control by the cial authorities of Ontario. Milk and cream prod any part of that province may now be shipped i United States, but no milk and cream produced restricted area of the Province of Quebec shipp Ontario may be shipped out to the United State

Telegraphic instructions advising of the modif of the embargo have been issued to collectors toms, consular officers in Canada, and to import officers in Canada, and to import laboratories bureau of chemistry which enforced the terms Food and Drug Act under which the embargo was

THE MILK MAN

By E. S. Mueller



-SO YOU SAY, MILK IS NOT IMPORTANT, AND YOU DONT NEED IT AT ALL ?
ABSOLUTELY— MILK IS NOT A NECESSITY, AS FAR AS I'M CONCERNED!
THE VERY SAME EVENING, FRIEND WIFE PREPARED THE SUPPER, BUT REMEMBERED WHAT HUBBY SAID ABOUT MILK AND TRIED IT OUT.
SAY- HONEY,— THERE'S NO MILK IN THE MASHED POTATOES,— THEY TASTE FUNNY.
HEY,—WHAT'S THE MATTER WITH YOU,— WHERE'S THE MILK FOR MY BANANAS, AND MY COFFEE ??
I THOUGHT YOU SAID, YOU DIDN'T NEED MILK?
ALL RIGH ALL RIGH YOU WIN!
Mueller

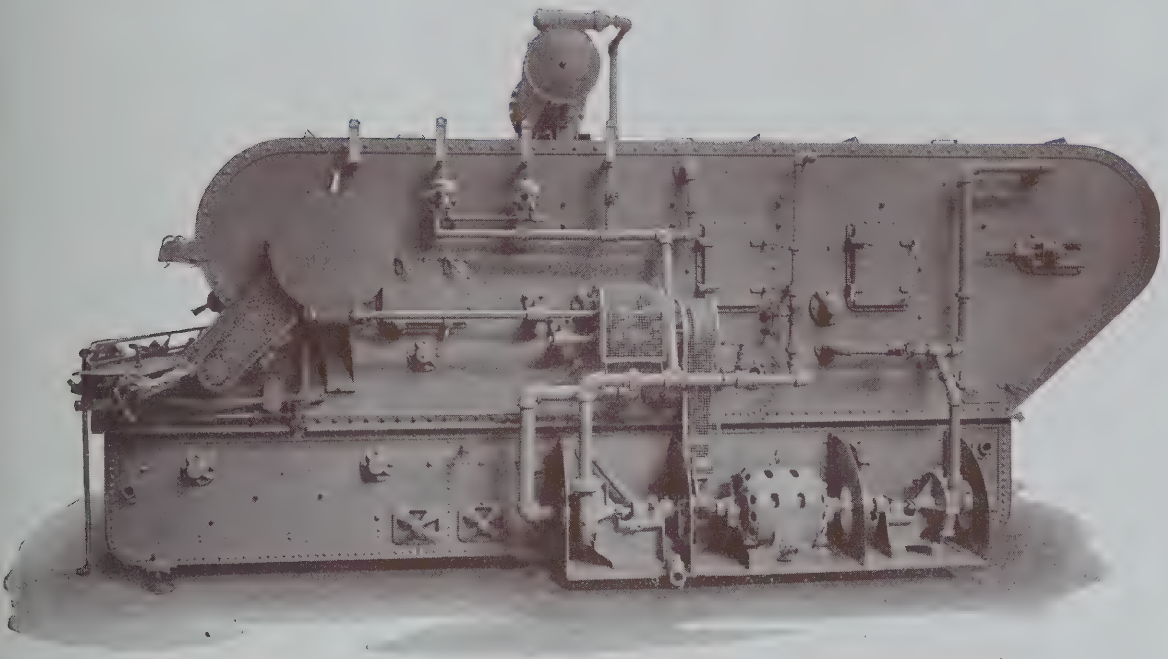
How Fast, *or*,
How *Clean*?



The illustration is of a standard 12 wide *CP* Ladewig Unit Type Bottle Washer with sterilizer attachment. Also made in 6, 8 and 10 wide sizes. The 12 wide has a capacity of 3600 bottles per hour.

The *CP* Ladewig Unit Type Milk Bottle Cleaner is a relatively slow speed machine. Because it is, wear on all moving parts is minimized and the bottles delivered are *clean*.

Without increasing the cost of the machine we could greatly increase the speed if we so desired. But, in line with an established *CP* policy, we build the kind of a machine which we think the majority of users want. Some people think we are mistaken in this. Perhaps we are but our 40 years of manufacturing experience has taught us that a machine which will produce 100 clean bottles a *day* is to be preferred to one which turns out 10,000 "doubtfuls" an *hour*.

You can't get excessive speed and clean bottles from the same machine. In the *CP* Ladewig you can't get excessive speed but you CAN get clean bottles.

Bulletin 1131 gives complete information. Write for a copy.

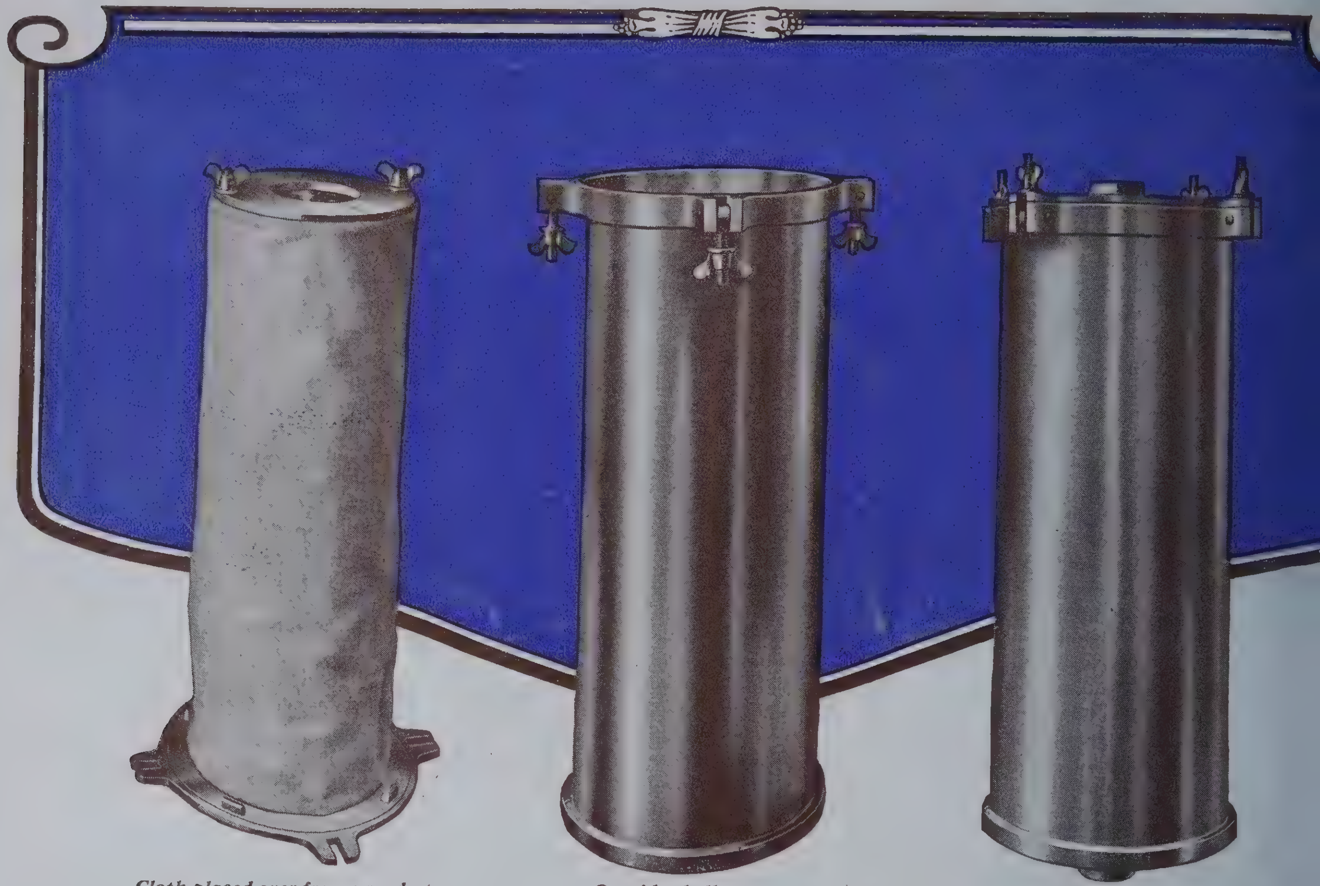
"FOR BETTER MILK HANDLING"



Cloth placed over frame ready to be set into shell

Outside shell—empty

The YORK Filter completely assembled

Illustrations show No. 1 YORK Filter, capacity up to 6,000 lbs. per hr.

A New Milk Filter

in which the cloth is placed in position before being assembled

THE YORK Milk Filter is the very latest type of improved filtering device. Since the cloth is placed in position before being assembled, you are able to see that it fits properly and that no milk is passing through unfiltered.

There are no wires or screens to clog or catch the dirt. Simplicity of design makes it extremely simple to operate. The cloth is the only part which must be replaced. The filter can be taken completely apart and cleaned thoroughly. The ease with which this can be done causes little wear and therefore long life.

The YORK Milk Filter is made of 2-ply tinned heavy copper sheet and brass castings heavily tinned all over. Like all other YORK products, it is produced—

Ladewig-Soelch

SUPER EIGHT

WHEREVER progressive milk plant managers foregather, the talk inevitably turns to bottle washing—and the new Ladewig-Soelch Super Eight. For this new Ladewig-Soelch has, in a few short months, turned a fresh page in bottle washing history. It has won a preferred position in the minds of milk plant managers the country over because it washes bottles faster, cleaner, and *cheaper* than they have ever been washed before. And yet the purchase price of the Super Eight is surprisingly lower than one might expect for such an extraordinary machine. Make any comparison you like, and you will prefer this New Ladewig-Soelch.

LIKE A BRIDGE
ANOTHER REASON WHY LAMSON SANITARY CONVEYORS
LAST LONGER

The frame of a Lamson Dairy Conveyor is truss-built, cross-supported like the framework of a steel bridge.

Rigid—firm—permanently aligned—this conveyor resists the daily volleys of shocks and blows from milk cans and cases.

This feature, plus the others described at the left, are reasons why Lamson Sanitary Conveyors will save you money by giving ***longer service, free of trouble.***

Orders vs Claims

The real merit behind the successful article, whether it be face powder or ice chutes, is best evidenced by how well, and to whom, does it sell? Here is ample evidence of the definite demand for Standard Victor Ice Chutes—an order—from one of the country's leading refrigerating engineers.

A postcard will bring you complete information as to the possibilities of Ice-Conservation in your plant, by the use of Victor Standard Refrigeration Products.

Niagara Falls—The Source of the Greatest Power Known to Man

The Miller HYDROSTATIC Principle of Sterilizing Bottles is now Standard the World Over!

TWELVE years ago Charles Miller became plant superintendent of the Bainbridge Bottling Company. He soon discovered that the general practice at that time in the beverage industry was to brush the dirt out of a bottle with an ill-smelling bristle brush, which soon became as filthy as the refuse in the bottle could make it, and while leaving the bottle in many instances clean to the eye, left it fairly alive with bacteria of all kinds.

Charles Miller immediately began to devote his entire time to the perfection of a machine that would rid his plant forever of this brush nuisance. Some important form of friction was necessary to remove the dirt. His thoughts at once turned to hydraulic or hydrostatic friction. He had witnessed the terrific action of water under pressure in engineering and mining projects, had seen hillsides torn away, boulders dislodged, everything give way to the tremendous power of torrents of water. He visualized this irresistible force turned loose on the inside and outside of dirty bottles . . . . . obviously, no dirt could resist it.

And so, with this terriffic force as a basic principle, Chas. A. Miller designed a bottle washing machine which has since revolutionized bottle washing in the beverage and brewery industries. And now the Dairy Industry, with its tremendous demand for clean, sterile bottles, is turning to the Miller Hydro, and finding in it a newer, better method of bottle cleaning, free from the mechanical ailments inherent in all brush washing machines.

Write us today for catalogue and full particulars of how the Miller Hydro can be made to pay for itself in your plant long before you make the last payment.

Another Great Plant Adopts the Cherry Gravity System *of* Pasteurization

For their new $225,000 plant at Highland, Illinois, the Highland Dairy Farms Company of St. Louis has installed the Cherry Gravity System of Pasteurization — including tubular preheaters, four 600 gallon Cherry Twin Coil Class M Pasteurizers with pure nickel coils and linings and equipped with automatic hot water controls, one 600 gallon Cherry Twin Coil Class M Pasteurizer with pure nickel coil and lining, for cream, and two 500 gallon Twin Coil Class M Machines for processing table cream and cream for butter making.

THIS beautiful new plant is setting a record for low bacterial count, deep cream line and fine flavor. Vitrified enamel interior. Located 30 miles out of St. Louis.

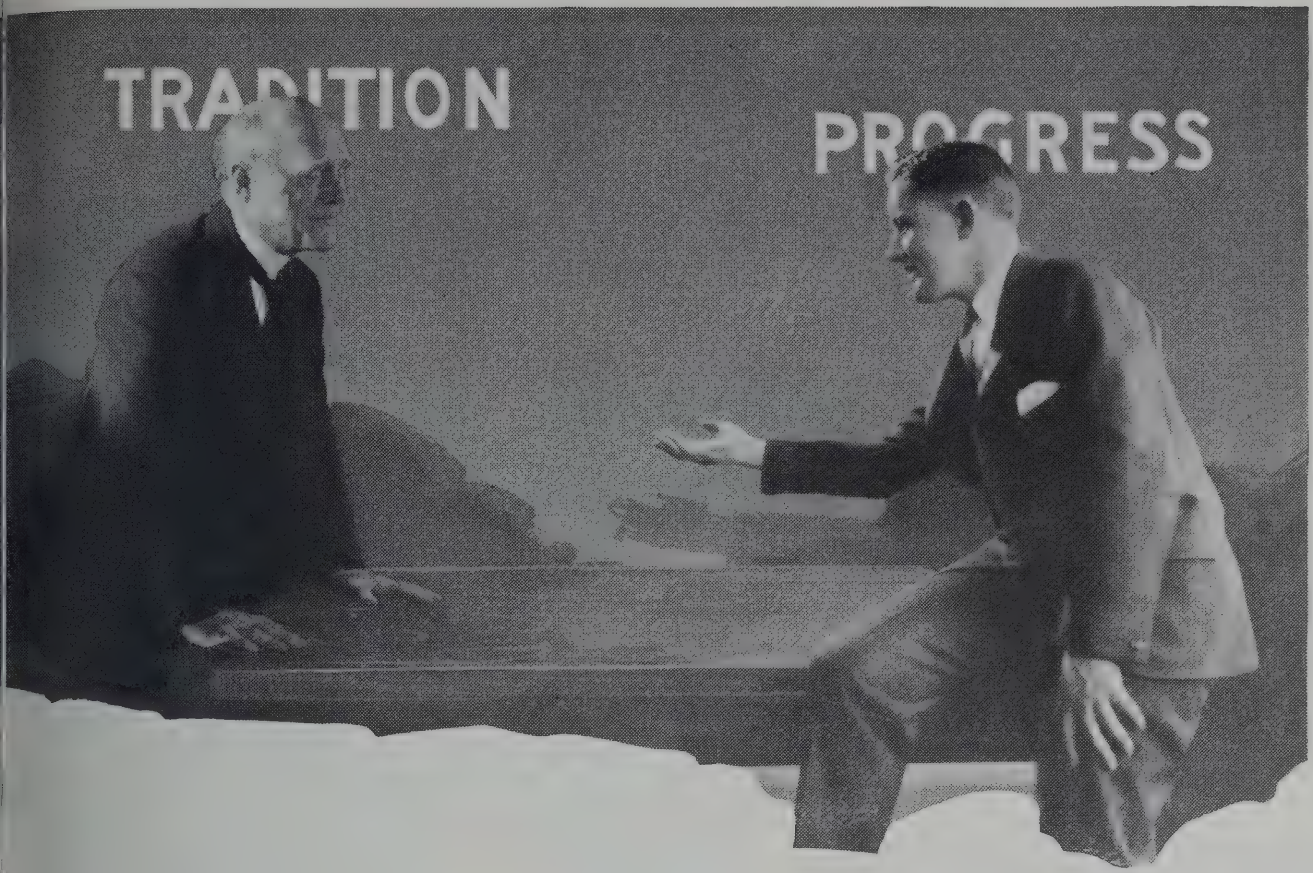
thinks all motors are alike



Listen, Lad—

I was talking with my friend today
out getting some more motors from him.
old him all you've been saying about your
t welded-steel motor but he just smiled and
id that you've been misled by 'talking
ints.' He admitted that all motors are
sically the same."

"Yes, Pop—

and all men are born equal — but it's to their shame if they stay that way.

Specialized endeavor lifts a man out of the standardized class.

And that's just how the "Linc-Weld" motor rose above its class.

Its whole engineering is directed to a single end: Motors.

And this development is sub-specialized into *Motors for specific purposes.*

If you want a pump motor—there's a "Linc-Weld motor for just that.

If you want an elevator motor—there's a distinct "Linc-Weld" motor for just that.

If you want a motor for *any* duty—there is a distinct "Linc-Weld" motor for just that.

Name your service and you get distinct, specialized, proved experience on that job exclusively.

Your friend's admission that all motors are born equal was over optimistic sales zest. "Linc-Weld'. motors are now in long pants instead of long whiskers'

A Typical Gaulin Installation at the Luick Ice Cream Co.

Standardize on the "Gaulin"

ORIGINATOR

of the

Two-Stage Valve

THE 2-Stage Valve, *as originated and developed* by the Manton-Gaulin Manufacturing Company, has met with such favor because of its remarkable gain in efficiency over single valve operation, or other homogenizing devices, that it is today rapidly being adopted as *standard equipment* in the leading ice cream manufacturing plants in America and Europe.

The results obtained have been so enthusiastically received that the Gaulin Homogenizer equipped with the 2-Stage Valve has not only supplemented the homogenizing machinery in many plants, but we are constantly being called upon to equip machines of other makes with this efficient dual valve.

We show, above, a typical Gaulin installation of two 800-gallon Homogenizers in the Luick Ice Cream Company plant at Milwaukee. When this company found it necessary to replace their viscolizing equipment, they unhesitatingly selected "Gaulins" equipped with the 2-Stage Valve.

More Gaulin Homogenizers are being manufactured and sold today than ever before in our history and we attribute this prosperity principally to our development of the 2-Stage Valve.

If you wish to secure *complete homogenization*—be assured of *positive viscosity control*—and guaranteed a *superior quality of finished product,* you will make the 2-Stage Valve, as *originated* by Gaulin, standard equipment in *your* plant.

A catalog describing the 2-Stage Valve in detail will be sent to you, free, upon request.

CRESCENT
CORK
INSULATION

Satisfactory Insulation!

Crescent 100% Pure (Made in U. S. A.) **Corkboard**—

is unequivocally accepted and acknowledged as being the most efficient as well as the most satisfactory insulation obtainable for Cold Storage Rooms. Of the many types of insulation offered, corkboard is the only one that has successfully stood the *"test of time"* in the refrigerating industry.

United's Service—

For 20 years, Owners, Architects and Engineers have relied upon "United's Service," for the complete installation of their Cold Storage Rooms. The proper installation of corkboard is equally as important as the quality of the insulation itself. It must be done correctly if best results are to be secured. ¶ Every "UNITED" contract is executed by experienced mechanics working under the personal supervision of trained engineers. Modern mechanical equipment that facilitates installation, is employed. Only methods of erection are used that have been thoroughly time-tested. Consequently—permanent, economical and satisfactory Cold Storage Rooms, result.

We will gladly have a representative consult with you on your insulation requirements. His suggestions may prove of great value to you. And we know that our estimate on your work will be attractive. Write us.

Save a ton in Weight!

Every pound saved in weight of the tank equals two pounds of pay load —

THUS 99% Pure Nickel Milk Tank construction saves you 2000 pounds deadweight and adds 4000 pounds payload.

The reason for this outstanding advantage is that 99% Nickel is inherently stronger than steel and permits us to use much lighter nickel sheets which results in a nickel tank construction that averages one ton less weight than any units, heretofore, used.

Combine this weight advantage with the sanitary advantages of a one-piece seamless nickel construction and you have two excellent reasons why 99% Nickel Milk Tanks are generally preferred throughout the dairy industry.

Let our engineers co-operate with you.

The Plant Behind the Machine

BEHIND the Lakewest Automatic Milk Bottle Sealing Machine is an organization of specialists who have conquered many difficult industrial problems.

If automatic machinery can be rightly termed the "Producing Partners of Industry," then the American Machine & Foundry Company have designed and developed some of the best producing partners that have ever worked with intelligent executives for lower costs.

The Lakewest Sealing Machine deserves to rank high among these achievements. This rank has been conferred by the opinions of many of the leading dairymen of the country.

Here are two factors that deserve consideration: A machine that fills a long-felt need, and an organization of responsible engineers standing back of the machine.

May we send you descriptive bulletins?

Commodore Perry Hotel will be convention headquarters. Secretary, W. A. Wentworth, 5 East Long St., Columbus.

EACH year brings a better understanding of the surplus milk problem. While this vexatious question is still a real bone of contention between dealers and producers in some sections we believe that progress is being made in solving it.

The producer of city milk, of course, hates to sell any milk at a lower figure than the established price. That is always low enough in his opinion. The dealer hates to buy milk at a loss. When he does so in order to placate the producer the business is on an unsound basis.

We don't blame the producer for accepting too much for his surplus milk, but we do blame the dealer who gives it to him. It should not be necessary, and it isn't necessary if the right sort of understanding prevails.

When the matter of surplus milk is properly explained the producer can understand it as well as anybody. He can and will understand that when butterfat in milk is used for making butter it is not worth as much money. Don't blame your producers for wa "something for nothing" if you are doing noth make them understand this surplus problem.

⚜

THE next time you get a "case of the blues" b you owe so much money on that fine bottling and its wonderful equipment, and you grow a few gray hairs trying to figure out how it is all going t just remember that you have lots of company. will make you feel better. Most successful busines are passing through or have passed through wha are experiencing.

"Too much credit nowadays in business," the a ist says, but aggressive, hard headed business m right on using their credit and building their bu institutions. They pay interest on money when judgment tells them that they can make that m earn them a profit above the interest.

But does that justify the borrowing of money up a fine plant when something cheaper will ser purpose? Does it justify the purchase of the mo pensive equipment? Does it justify the spendi borrowed money "just for show," to build and a "model" milk plant?

We believe it does. We believe the expenditu money—even borrowed money—to make everyth and about the milk bottling plant attractive is mor justified. Money thus expended is well investe not only increases the efficiency of the organizati it improves morale. It also gives the consumer tha fidence which results in increased consumption products from that plant.

We believe that the milk dealer who owns modern plant and has an efficient organization, an may owe a lot of money, has no reason to get di aged. He is owing money in a wonderful busine a business where it is unwise to economize in "for show" if you please. We believe he has a ri expect that increased sales will take care of inc interest and other charges.

Our faith in the business, however, is predicat the proposition of following through with the righ of service to the consumer. A fine plant represen the consumer's door by a dingy looking wagon slouchy looking driver will not give the consum sort of impression that builds sales. That fine must be supported by everything else right in ke with it. Some men in the business make that mi

⚜

MILK men who find time or take time to play invest their time when they do so. The ma thinks that he can't be spared from his business enough to get the recreation that his mind and needs makes a serious mistake. He is only fooling self. The real business man—the man of exe vision and ability—is smart enough to know th needs regular play hours to keep fit for his job. sort of doctrine may not meet with the approval man with his "nose on the grindstone" who thin can't get away, but that doesn't prove the do wrong.

IE milk dealers still refuse to recognize the value certified milk in building their regular milk busi- They look upon certified milk as a sort of neces- ompeting evil. They fail to push certified sales, g deliveries only when certified milk is absolutely nded by a customer.

rtified milk is produced to meet a specific need. plies the baby and the invalid with a milk from every form of contamination has been excluded failing adherence to the most rigid production ique. A trip through a certified barn at milking nd a tour through the dairy will instantly explain the general milk supply cannot be similarly pro- , and yet a modern certified milk plant is as effi- y and economically conducted as any factory where ction costs are carefully figured.

steurization is a priceless safeguard of public . As long as a need for it exists every effort d be made to place each hamlet, town and city its protection. The dealer who sells certified milk , as he may think, encouraging a competitor. In y, certified milk is in no way a competitor of pas- ed milk. It fills a specific demand, being produced to meet such requirements as are recognized by al authorities. It is the product supreme which letes the efficiency of the service a dealer can give ade.

en, too, the higher price commanded by certified like every other product of higher price and qual- xerts a stimulating influence on the sale of the low- iced milk. It is more difficult for the consumer to lain about his fifteen-cent-quart of pasteurized milk the youngest member of the family is thriving on ed milk at twenty-five cents a quart, or even high- he standard of any value is realized in terms of arison. When the standard of comparison is high ller benefits, and as long as certified milk sells for h higher price than pasteurized milk the city dis- or should realize he cannot afford to be without it. is real merchandising.

* * *

IERE is no doubt but what our dairy laws have ac- omplished a great deal for the dairy industry, but going to be a long time before legislation will re- human initiative and honest effort in bringing improvements in dairy conditions. Some people to think that if we could just have a state or al law to govern every act that our dreams of per- n might be realized. Every time a new problem sts itself, or an old one comes up, they think of g to the state legislature or to congress and asking law to solve their problem. Some dairy problems been solved by legislation but far more have been l by honest, earnest work on the part of men in the ess. We need more of the same kind of effort today t will do more to promote the best interests of ing than anything else.

THE transportation problem has always been and will continue to be one of the city milk distributor's biggest problems. Getting the milk from the farms to the distributing plant, and then again to the doorstep of the consumer is a very important factor in the dealer's reason for existence. It is an expensive factor and for this reason his profits often are fixed by his transportation costs. No two dealers work under the same conditions. The transportation problem is in a sense a local one, but there are certain fundamentals that are general.

Readers of The Milk Dealer have had set before them a great deal of information on this transportation problem. We have published many articles touching upon all phases of collection and distribution, and there will be more information of the same kind in each issue. The question of transportation cost is a vital one. It makes up a big share of the total cost of operating a milk distributing enterprise. How to get the most for each dollar spent for transportation is an ever present problem.

How to operate a plant efficiently, and that includes transportation costs, and how to sell more milk are the two big problems confronting the milk distributor. These are the two problems we have uppermost in mind all the time when gathering and compiling the information contained in each issue of The Milk Dealer. We shall keep on pounding away on plant efficiency and milk salesmanship, feeling that in doing so we are helping our readers to solve the two big problems before them. In doing so, we rather minimize other important questions but the greatest good for the greatest number is what we are striving for, and we feel that we are accomplishing our purpose best by working along these lines. If we help the reader to operate his plant more economically, and also sell more milk, we are rendering him a greater service than we could render in any other way.

* * *

HOW far can a milk bottle travel? Or, let us put it this way, how far can a milk bottle go away from home and get back again safe and sound?

We shall probably never know the answer, but we know of a milk bottle that traveled all the way from Detroit, Mich., to Fairmont, Minn., and was finally returned to its owner in the Motor City. It happened this way: the writer bought a pint bottle of milk in a neighborhood store in the southern Minnesota town which happened to be our old home town. It carried the cap of a local milk distributing firm, but blown in the bottle were these words, "Detroit Creamery Co., Detroit, Michigan."

We lugged that bottle back to our office and then sent it on to its owner. The Minnesota milk dealer made us pay a nickel for the bottle and now we are wondering where we should collect that nickel without doing anybody an injustice. It was not a "store" bottle so the Detroit folks are clearly entitled to their bottle without charge. The Minnesota firm probably got the bottle in place of one they had sent out so we can't look to them. The question remains, where are we to collect and how did that bottle get that way anyway?

Putting On A Successful Milk Exhibit

Teaching the Hoosiers to Better Appreciate Milk and How to Use it More Freely in the Home. Indiana State Fair Exhibit an Outstanding One

THURMAN B. RICE, A.M., M.D.*

THE state of Indiana believes in its state fair. Each fall sees the entire state represented in some form or another on the grounds at Indianapolis, the state capital. The two state universities—Indiana and Purdue—have special buildings for their separate exhibits. Purdue, being largely an agricultural school, is in its element of course. The exhibit of Indiana University is usually less closely related to the state's basic industry.

The writer was given the responsibility for preparing the exhibit for the medical school of Indiana University, to be shown in September, 1926. After a great deal of deliberation the theme of the exhibit was chosen and the exhibit planned about that theme. It isn't easy to find a subject of universal interest to a state fair crowd. Folks of all ages and stations were among the crowds. Most of the spectators were from farming communities, but there were also a great many from Indianapolis, the largest city in the state.

It was decided that the exhibit should be along the line of public health, since that is the chief interest of the man in charge of the plans. Milk is the most important of foods, and is at the same time one of the most dangerous when it is carelessly handled—as it need not be. It is also a broad point of contact between the country and the city—producer and consumer.

A detailed description of the exhibit may be of interest or of help to others who are planning a si show. In the center of the booth surrounded by a rope was a table, the legs of which were the replic four great milk bottles—each being exactly three the dimensions of a standard quart milk bottle. were turned out of wood and enameled white w generous cream layer of yelow. The table top green and carried a very attractive model of a p little cottage with shrubbery surrounding it. The was made of green sawdust for grass. Children shown playing on the lawn in front of the cottage

The display on the table was made by the depart of occupational therapy of the James Whitcomb Hospital for Children, one of the university hosp and was very well done, indeed. The central idea resented was enunciated in the sentence painted in on the edges of the table top:

"Home and Health Built on Milk."

Next in importance in the exhibit was the ima representing the approved manner of feeding two b —a breast fed baby on the right and a bottle fed on the left. These two babies were represented by attractive by-low dolls, the first being in its mot arms and the other alone. Both babies gave the app ance of bounding health.

Milk for the bottle fed baby was produced in the dairy shown on the wall at the extreme left of the ture. A fine cut-out barn with a red roof and a si

TWO BREAKFASTS
HOME AND HEALTH BUILT ON MILK
VITAMINES

This will give some idea of the arrangement of the exhibit, though it does not show the most interesting end of the booth, nor does it give any idea of the very pretty colors used in the placards and other decorations.

mill made of Tinker-toy sticks and a red wheel n by a concealed electric fan, a watering trough, a ing stream, and a country road skillfully painted by ior medical student, Paul Iske, made the scene very stic, very clean looking, and quite attractive, as may een from the photo. "Contented cows" grazed in olling fields in the back ground. Toy trucks were n transporting the milk along country roads to the urization plant in the city. Other trucks hauled it attractive city streets to the home of His Royal ness, the American baby, shown peeping over the of his very pretty suburban home. This is not it to imply that bottle fed babies climb on house but it is a fact that they can be mighty strong, fine s all right.

white cord to represent the flow of milk ran from lairy along the country road, to the pasteurization , to the delivery truck, to a pint bottle of milk on loorstep, thence to a hygienic nursing bottle, and y to the baby's lips. A series of captions in white rs on black card board told the story of clean milk llows: "Healthy cows"—"Clean barn"—"Healthy ers" — Refrigeration" — "Prompt delivery" — an cans"—"Pasteurization"—"Refrigeration in the "—"Clean nursing bottle"—"Physicians' feeding ula."

he nursing baby is shown at its mother's breast. To nother's lips run ribbons of various colors indicat- the kinds of food that she should eat—an orange on to a dish of fruit—green to a basket of vegetables ver to a pitcher of water—and white to a bottle of . Three other ribbons were shown going to placards esenting the nursing mother's needs — vitamines, instruction, rest, etc. All of these exhibits were above the eye level and were best seen while the ors were in the aisle outside of the booth.

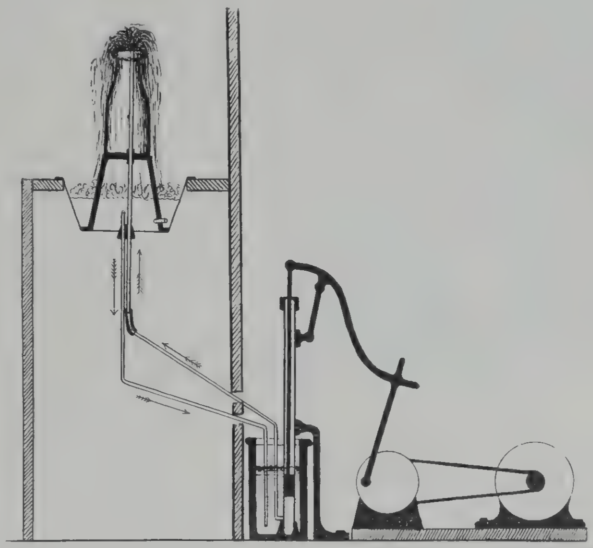
n the table just beneath the nursing mother was n the Fountain of Youth, which could be nothing than a milk bottle perpetually overflowing with . This illusion was most effective and was produced he use of apparatus as shown in the accompanying ram. Around the fountain were six figures making way to the source of Youth and Health—a baby, ool child, a housewife and mother, a worker, an in- l in her chair, and the aged grandfather with his .

had been told that milk could not be made to flow is way, as it would foam and sour, churn into but- separate out and, in fact, do everything that it ld not. But my heart was set on this particular t, so I persisted and made a complete success of it. secrets are as follows: Use a low-speed piston pump, ad of a sigh-speed centrifugal pump which would easily connected up but which would beat the milk a foam. The diagram makes clear the arrangement e pump. Skimmed milk was used so as to prevent churning of butter, and a little formula was added revent souring. The apparatus ran continuously teen hours a day for eight days in very hot weather, but three changes of milk. The milk did not sour eably, did not churn, did not foam more than we ted it to, and was a 100 per cent success.

t another place an old-time breakfast was contrasted a modern breakfast—often called a "hasty" break- —but immeasurably superior for all that. The kfast of our childhood days on the farm consisted of l sausage, pancakes or hot bread of some sort, heavy p, fried potatoes, preserves, and coffee. It was ted out that such food has little or no vitamines, is too concentrated, is too heavy for most digestions, and has too much fried stuff.

The modern breakfast of an orange, hot cereal with milk, toast with butter, cocoa made with milk, and bacon is far better, though it can be prepared in a hurry. Indeed, the very fact that it is easy to get is in its favor, for mothers have enough to do during the long day without baking hot bread and making elaborate preparations for a big "old-fashioned breakfast."

Knowing that there would be many mothers who would say that their children do not like milk we arranged to show ways of enticing the appetite for the most valuable of all foods. A bottle of milk is shown on a shelf with ribbons leading to the various suggestions as follows: "Salt it" with a salt shaker handy; "Sweeten it" with sugar bowl near; "Eat it with soda or graham crackers" with two crackers ready. Other suggestions were to put flavoring extracts with it, to make custard or egg nog, use it in cooking other foods, eat it with fruit and cereal, make cocoa and other chocolate milk drinks, add malted milk powder, or malted grape nuts, eat ice cream, or drink the milk with a straw. Many mothers got out their note books and wrote down the suggestions. They thanked us many times for these suggestions because they said they were in need of just such help.



Realizing that practically all of the danger that is ever associated with the drinking of milk comes from its relation to bacteria we undertook the big job of trying to make the truth about bacteria tangible. The public was shown perfectly harmless bacteria growing on Petri plates, and in culture tubes. The fact that by far the greater number of bacteria are perfectly harmless or even very useful was emphasized. A large plate seeded with the red pigment producing bacteria (bacillus prodigiosus) attracted a considerable amount of attention. After the plate was planted it was partly covered with black paper cut in the shape of the letters I U (Indiana University) and then exposed for two hours to bright sunlight. The light killed the germs except under the letters, so when the plate was incubated it gave red letters on a white background (red and white being the university colors.) This also served to demonstrate the value of sunlight in killing germs.

Another perfectly harmless germ which produces a bright yellow pigment had been planted in such a way as to spell out the wise admonition "go to college." No attempt was made to conceal the well known fact that there are bacteria in milk, but it was emphatically

The South and Its Milk Supply

Dairying and Diversification Taking Root as Southerners Turn to Advanced Agriculture and Better Merchandising of Dairy Products

How One Dealer Made Quart Customers Out of Pints Buyers

By CRADDOCK GOINS

L. J. FOLSE.

COTTON production and its relation to advanced agriculture was the subject of an interesting article in the May issue of The Milk Dealer by J. L. Holden of The Pfaudler Company. Mr. Holden, writing under the headline "Shall it be Cotton or Milk," brings out some interesting facts regarding the situation in the Southern states.

He shows an interesting insight into the temper of the Southern people as they face agricultural prospects of the future. All of us readily can agree with Mr. Holden that the South is turning largely from the false lure of King Cotton to the safe and sure lines of dairying and diversification; that the cotton situation rapidly is driving more of the farmers of the South back to the progressive lines of agriculture followed in this section long years ago, long before a peculiarly unhappy situation drove the Southerners to one-crop folly, during the dark, drab days of the reconstruction period.

Perhaps Mr. Holden's single error was the statement that cotton production does not destroy the fertility as do some other crops. Cotton production, as a matter of fact, does destroy the productivity of the soil to a greater extent than possibly any other crop grown, adding greatly to the expense of the production, necessitating the copious use of high-priced commercial fertilizers, and year after year wearing away a soil that for natural productivity is not surpassed anywhere else in the world.

There are two important factors to be taken into consideration today in considering the attitude of the Southern people toward dairying development, and one of these Mr. Holden covered in a highly understanding way—the cattle tick.

Flood Scenes on the Lower Mississippi.

The tick is being driven out of the South. Georgia
Alabama attacked this ravenous pest several years
and Georgia now is virtually tick-free. Florida is fol
ing suit. One man who possibly has done more to d
out the tick from the South than any other is L. J. F
general manager of the Mississippi State Board of D
opment, a man who has directed a stupendous camp
toward advanced agriculture, the upbuilding of a da
ing industry, promotion of poultry and livestock.

A statewide stock law enacted in Mississippi a
ago will make it possible for the tick to be driven f
every county in the Magnolia state. This law was pa
after many months of heavy labor by Mr. Folse,
went throughout his state delivering the ultimatum
the tick would have to be attacked upon a state-
plan before it could be completely driven out of
commonwealth. At that time tick-eradication wa
county proposition; a county either went tick-fre
it didn't, regardless of what neighboring counties m
do. As a result one county attempting to become t
free would find that another tick-infested county m
this work impossible. In the northeastern part of
state the counties worked pretty solidly, and after
tick was driven out those counties made consider
strides in dairying, as attested by the fact that the
den Milk Company established a condensery at St
ville several months ago, and later the Carnation
Products Company did likewise at Tupelo, both cities
ing in the heart of a rich agricultural belt that has
waited for the farmers to take advantage of their da
ing possibilities.

In other parts of the state, taking advantage of
opportunity to drive out the tick, various cities are
moting, through Mr. Folse's organization, the establ
ing of cheese factories. F. C. Chitty, enterprising
retary of the Yazoo City Chamber of Commerce, t
the initiative,
with the aid
Mr. Folse and
state board of
velopment, he

seen.

Similar underta

re under way now in various sections of Mississippi.
w, for the other great determining factor regard-
e South's agricultural future: The Southern
ippi valley faces a reconstruction period such as
confronted this section since the aftermath of the
War. Just as the weary, war-worn, grief-torn
lerate soldier returned to his land to find ruin
esolation, just so are victims of the Mississippi
flood, herded in refugee camps from Louisiana
ansas, looking forward to the bleak prospect of
ting to grow crops with their implements de-
l, their barns washed away, in many instances
heir homes destroyed or so badly damaged they
of little use. Some 400,000 or 500,000 people are
or less in this predicament, with livestock de-
l, with cows, chickens, hogs either drowned or
the woods.

w, these men will have to do some careful figur-
you readily will agree when you note that the
mules and cattle runs into many, many thousands
ds of stock, and it is estimated that if every
ed animal is immediately replaced, it will require
trains hauling nothing but cattle and mules to
ack the stock lost.

condition facing the farmer of the Southern
ippi Valley now, just as in the reconstruction
of sixty years ago, is the matter of getting some-
into the ground that will sustain him, enable him
off his debts and get on his feet. But, happily,
s not now face the great obstacle that the Civil
econstruction period developed—the obstacle of
ing a crop to represent currency alone. Follow-
Civil War the South had no currency, not a red
Confederate money was entirely worthless, never
ed. Cotton represented the only form of cur-
known, and a merchant could advance credit only
ton, for it was not a perishable crop, and it was
f some monetary return.

w, however, the Southern Mississippi Valley
knows that he not only must raise cotton, but
mething to eat, and there are many reasons to
that the rehabilitation system now underway
nd many farmers growing less cotton and more
nd feed crops. Perhaps not so much food and
they should. Even leaders in this work are un-
d about that. It is undeniably true that even now
will be more cotton grown than should be, but
effort is being made to enable the farmers to grow
f the truck crops.

Crosby, head of the flood relief and reconstruc-
ork in Mississippi, long has been laboring in the
t of building the agriculture of his state. Mr.
, a millionnaire lumberman, with hardly any per-
nterest in agriculture, has given this idea much
t and effort, and he has done much to draw new
and new farmers into Mississippi from the great
states.

Folse long ago recognized in the Mississippi
a natural dairying empire unsurpassed anywhere.
n't stopped with showing the farmers what can
e, he goes further and aids the dairy people in
nerchandising end of the matter, conducting an
e publicity system that exploits the wholesome-
milk and other dairy products, of how much it
to the advancement of the South for the people
more dairy products, butter, cheese, eggs—all of
the interest of public health, which his organiza-
s promoted vigorously, as well as in the interest
uraging the growth of the dairy industry.

Yazoo county, in the Mississippi Delta, in the
where men formerly cocked their heads and said,
n't be done," I visited a number of dairy farms
recently and saw how well it is being done. One man had a farm that three years ago was typically a run-down, worn-out cotton farm, prolific in nothing but cotton and debts and vain regrets. Today that man has restored that wonderful soil, has built up his farm, is making money from milking twenty-five cows and has good hogs, chickens, guineas, turkeys, good crops of tomatoes, lettuce, turnips, cabbage, potatoes, corn, oats, wheat, barley—and no cotton at all.

This man, a Mr. Allgood, talked very enthusiastically to the writer about how he had sown soil-repleting crops in acres formerly run down, how he had watched these acres build up, how much fun he had in building up his pasture, already rich from the beginning with luscious grasses.

"Where did you get this diversified idea," he was asked. "In Wisconsin? In Iowa?"

He shook his head. "In Georgia," he answered. "I farmed there for many years, grew nothing but cotton and debts. I knew better, but it seemed that the more money I lost in cotton, the more I wanted to grow. Something about human beings makes them want to make their prosperity. But not necessarily a lasting farm aristocracy, for nothing founded upon a one-crop system, of course, could be called lasting. The farming success of the Delta people was because of their remarkably fertile land, their good growing conditions, plenty of water and because of an exceptionally high order of citizens, a people of great spirit. Many fortunes were built up out of cotton, but in late years the Delta people have taken big losses in the same crop.

Its wonderful soil, ability to grow virtually every variety of food and feed known, caused Mr. Folse to labor earnestly to bring about interest in dairying in the Delta.

The usual "it-can't-be-done" chorus greeted him everywhere, but he persevered.

"Feedstuff can't be grown in the Delta," many told him with that extraordinary cocksureness that is strangely characteristic of people talking about something they don't know anything about. Maybe some day somebody will explain why it is, but this writer never has been able to understand why there are so many idiots in the world ever ready to speak so positively regarding what can or can't be done in a given section or with a given crop.

Hadn't anybody tried it to any appreciable extent, but yet most of them felt it couldn't be done—and let it go at that. They were sold on a negative thought.

Mr. Folse persevered, however, and today there are many people in the Delta who have showed that it can be done—and is being done—that they can grow as good alfalfa there as any other state in the world, and can get more cuttings that is possible in Minnesota, Wisconsin, Iowa and other states in the cold belt. Further, they are growing worlds of lespedeza, kudzu hay, soy beans, velvet beans, timothy clover, Johnson grass, and many, many varieties of feed crops that dairymen of the East and the West never heard of.

Near the capital city of Mississippi there is a farm operated by a Mr. Bridges, a native farmer, that will compare with the best to be found anywhere, a well terraced farm, with good growing crops, good livestock, well equipped, good barn, a lighting system, a plumbing system, well-kept fences and out houses, good fruit trees.

"Everybody else can do the same thing, down here, but for some reason people seem to think it's against the law to grow anything but cotton," he said. "However, many of my friends are giving up this foolish thought. We are growing out of it. In a few years there will be few of the old one-croppers left, but in the cases of many

(Continued on page 118)

He Asked for A Drink of M

What Will the Men in the Milk Industry Do About It?
Lindbergh Thrilled the World and Then
Asked for Milk to Drink

HE ASKED for a drink of milk—just a drink of milk—nothing more. They eyed him strangely, not understanding, in bewilderment. And when he repeated the request they regarded him with puzzled gaze, muttering to themselves, saying:

"Les Americaines, personne ne comprende y pas—ils sont brunte, n'est ce pas?"

("These Americans; there is no understanding them; they are a peculiar people, aren't they?")

Be that as it may, the fact remains that Lindbergh—"Slim, the Lucky"—spurned the choicest offering of the people of **La Belle Francaise** and let them understand, once and for all time, that he was an American—an AMERICAN—one from the home of the dry and the land of the milk maid.

"Slim" Lindbergh is a name on many tongues today. He successfully carried out an undertaking that many thought of only in terms of The Great Perhaps—which is to say, maybe he would and maybe he wouldn't.

There is a great merchandising lesson behind the exploit of this stripling Lindbergh. He is younger than you and I—much younger.

Lindbergh, the boy whom they called The Lucky, safely navigated an aeroplane over stark, cold, naked space into a city called Paris, mustering up all the stamina and the plain bald courage peculiar to a people of do and dare.

Lloyds offered no odds on the undertaking. That is a circumstance difficult for most of us to understand. Lloyds, however, did no betting, and when we stop to reflect, there are few exploits in which Lloyds will not take a chance.

Some several months ago this publication published a department called "Milk for the Mighty." That is the classification in which this episode of American achievement should be placed.

"Slim," a milk-fed boy, a lad peculiarly American from the earliest possible tradition, decided that he wanted, above all things, to set sail for Paris, taking the air in preference to all other avenues of travel. It was a hazardous expedition, requiring the utmost in skill, in daring, and in nerves.

"Gimme a drink," said the frail lad who dropped out of the sky upon the gay Parisiennes.

So the Parisiennes, kindly souls, accommodating, proceeded to comply; but their drink was that of entirely a different variety from what "Lindy, the Lucky," wanted. He wanted milk. He made it plain that was what he wanted—milk and nothing else.

The Parisiennes, not understanding, blinking and trying to ascertain if their ears heard aright, nodded thoughfully, and then a light broke.

"Ah, mais les Americaines, ne personne pas y comprende—ils sont magnificique, mais abrraitement, n'est ce pas?"

Yes, they are—not so? a magnificent people, but extremely difficult to understand—these Americans.

The first thing offered Lindbergh to drink was something that could not legally be sold in America–
thing tabooed in this fair and favored land for
many years. Lindbergh possibly never saw ins
those places where the drinks, dear to the hearts
Parisiennes, are sold. But the thing that impres
most is this: What are the milk dealers going
about Lindbergh's victory? It is their victory, to
know, for when Lindbergh set forth upon that haz
journey over a wide sea, braving fog and sleet and
and unknown terrors of the night—when he set
say, he traveled and not alone—dairy health tr
with him!

Something less than 36 hours it took him to ma
